THE HOUSE OF WHISPERS.*

By WILLIAM LE QUEUX.

CHAPTER I.—THE LAIRD OF GLENCARDINE.

'WHY, what's the matter, child? Tell me.'

'Nothing, dad—really nothing.'

'But you are breathing hard; your hand trembles; your pulse beats quickly. There's something amiss—I'm sure there is. Now, what is it? Come, no secrets.'

The girl, quickly snatching away her hand, answered with a forced laugh, 'How absurd you really are, dear old dad! You're always fancying something or other.'

'Because my senses of hearing and feeling are sharper and more developed than those of other folk perhaps,' replied the white-bearded old gentleman, as he turned his sharp-cut, gray, but expressionless countenance to the tall, sweet-faced girl standing beside his chair.

No second glance was needed to realise the pitiful truth. The man seated there in his fine library, with the summer sunset slanting across the red carpet from the open French windows, was blind.

Since his daughter Gabrielle had been a pretty, prattling child of nine, nursing her dolly, he had never looked upon her fair face. But he was ever as devoted to her as she to him.

Surely his was a sad and lonely life. Within the last fifteen years or so great wealth had come to him; but, alas! he was unable to enjoy it. Until eleven years ago he had been a prominent figure in politics and in society in London. He had sat in the House for one of the divisions of Hampshire, was a member of the Carlton, and one year he found his name among the Birthday Honours with a K.C.M.G. For him everybody predicted a brilliant future. The Press gave prominence to his speeches, and to his house in Park Street came Cabinet Ministers and most of the well-known men of his party. Indeed, it was an open secret in a certain circle that he had been promised a seat in the Cabinet in the near future.

Then, at the very moment of his popularity, a terrible tragedy had occurred. He was on the platform of the Albert Hall addressing a great meeting at which the Prime Minister was the principal speaker. His speech was a brilliant one, and the applause had been vociferous. Full of satisfaction, he drove home that night to Park Street; but next morning the report spread that his brilliant political career had ended. He had suddenly been stricken by blindness.

In political circles and in the clubs the greatest consternation was caused, and some strange gossip became rife.

It was whispered in certain quarters that the affliction was not produced by natural causes. In fact, it was a mystery, and one that had never been solved. The first oculists of Europe had peered into and tested his eyes, but all to no purpose. The sight had gone for ever.

Therefore, full of bitter regrets at being thus compelled to renounce the stress and storm of political life which he loved so well, Sir Henry Heyburn had gone into strict retirement at Glencardine, his beautiful old Perthshire home, visiting London but very seldom.

He was essentially a man of mystery. Even in the days of his universal popularity the source of his vast wealth was unknown. His father, the tenth Baronet, had been sadly impoverished by the depreciation of agricultural property in Lincolnshire, and had ended his days in the genteel quietude of the Albany. But Sir Henry, without betraying to the world his methods, had in twenty years amassed a fortune which people guessed must be considerably over a million sterling.

From a life of strenuous activity he had, in one single hour, been doomed to one of loneliness and

[*All Rights Reserved.*]

inactivity. His friends sympathised, as indeed the whole British public had done; but in a month the tragic affair and its attendant mysterious gossip had been forgotten, as in truth had the very name of Sir Henry Heyburn, whom the Prime Minister, though his political opponent, had one night designated in the House as 'one of the most brilliant and talented young men who has ever sat upon the Opposition benches.'

In his declining years the life of this man was a pitiful tragedy, his filmy eyes sightless, his thin white fingers ever eager and nervous, his hours full of deep thought and silent immobility. To him, what was the benefit of that beautiful Perthshire castle which he had purchased from Lord Strathavon a year before his compulsory retirement? What was the use of the old ancestral manor near Caistor in Lincolnshire, or the town-house in Park Street, the snug hunting-box at Melton, or the beautiful palm-shaded, flower-embowered villa overlooking the blue southern sea at San Remo? He remembered them all. He had misty visions of their splendour and their luxury; but since his blindness he had seldom, if ever, entered them. That big library up in Scotland in which he now sat was the room he preferred; and with his daughter Gabrielle to bear him company, to smooth his brow with her soft hand, to chatter and to gossip, he wished for no other companion. His life was of the past, a meteor that had flashed and had vanished for ever.

'Tell me, child, what is troubling you?' he was asking in a calm, kind voice, as he still held the girl's hand in his. The sweet scent of the roses from the garden beyond filled the room.

A smart footman in livery opened the door at that moment, asking, 'Stokes has just returned with the car from Perth, Sir Henry, and asks if you want him further at present.'

'No,' replied his blind master. 'Has he brought back her ladyship?'

'Yes, Sir Henry,' replied the man. 'I believe he is taking her to the ball over at Connachan to-night.'

'Oh yes, of course. How foolish I am! I quite forgot,' said the Baronet with a slight sigh. 'Very well, Hill.'

And the clean-shaven young man, with his bright buttons bearing the chevron *gules* betwixt three boars' heads erased *sable*, of the Heyburns, bowed and withdrew.

'I had quite forgotten the ball at Connachan, dear,' exclaimed her father, stretching out his thin white hand in search of hers again. 'Of course you are going?'

'No, dad; I 'm staying at home with you.'

'Staying at home!' echoed Sir Henry. 'Why, my dear Gabrielle, the first year you 're out, and missing the best ball in the county! Certainly not. I 'm all right. I sha'n't be lonely. A little box came this morning from the Professor, didn't it?'

'Yes, dad.'

'Then I shall be able to spend the evening very well alone. The Professor has sent me what he promised the other day.'

'I 've decided not to go,' was the girl's firm reply.

'I fear, dear, your mother will be very annoyed if you refuse,' he remarked.

'I shall risk that, dear old dad, and stay with you to-night. Please allow me,' she added persuasively, taking his hand in hers and bending till her red lips touched his white brow. 'You have quite a lot to do, remember. A big packet of papers came from Paris this morning. I must read them over to you.'

'But your mother, my dear! Your absence will be commented upon. People will gossip, you know.'

'There is but one person I care for, dad—yourself,' laughed the girl lightly.

'Perhaps you 're disappointed over a new frock or something, eh?'

'Not at all. My frock came from town the day before yesterday. Elise declares it suits me admirably, and she 's very hard to please, you know. It 's white, trimmed with tiny roses.'

'A perfect dream, I expect,' remarked the blind man, smiling. 'I wish I could see you in it, dear. I often wonder what you are like, now that you 've grown to be a woman.'

'I 'm like what I always have been, dad, I suppose,' she laughed.

'Yes, yes,' he sighed, in pretence of being troubled. 'Wilful as always. And—and,' he faltered a moment later, 'I often hear your dear dead mother's voice in yours.' Then he was silent, and by the deep lines in his brow she knew that he was thinking.

Outside, in the high elms beyond the level, well-kept lawn, with its gray old sundial, the home-coming rooks were cawing prior to settling down for the night. No other sound broke the stillness of that quiet sunset hour save the solemn ticking of the long, old-fashioned clock at the farther end of the big, book-lined room, with its wide fireplace, great overmantel of carved stone with emblazoned arms, and its three long windows of old stained glass which gave it a somewhat ecclesiastical aspect.

'Tell me, child,' repeated Sir Henry at length, 'what was it that upset you just now?'

'Nothing, dad—unless—well, perhaps it 's the heat. I felt rather unwell when I went out for my ride this morning,' she answered with a frantic attempt at excuse.

The blind man was well aware that her reply was but a subterfuge. Little, however, did he dream the cause. Little did he know that a dark shadow had fallen upon the young's girl's life—a shadow of evil.

'Gabrielle,' he said in a low, intense voice, 'why aren't you open and frank with me as you once used to be? Remember that you, my daughter, are my only friend!'

Slim, dainty, and small-waisted, with a sweet, dimpled face, and blue eyes large and clear like a child's, a white throat, a well-poised head, and light-chestnut hair dressed low with a large black bow, she presented the picture of happy, careless youth, her features soft and refined, her half-bare arms well moulded, and hands delicate and white. She wore only one ornament—upon her left hand was a small signet-ring with her monogram engraved, a gift from one of her governesses when a child, and now worn upon the little finger.

That face was strikingly beautiful, it had been remarked more than once in London; but any admiration only called forth the covert sneers of Lady Heyburn.

'Why don't you tell me?' urged the blind man. 'Why don't you tell me the truth?' he protested.

Her countenance changed when she heard his words. In her blue eyes was a look of abject fear. Her left hand was tightly clenched and her mouth set hard, as though in resolution.

'I really don't know what you mean, dad,' she responded with a hollow laugh. 'You have such strange fancies nowadays.'

'Strange fancies, child!' echoed the afflicted man, lifting his gray, expressionless face to hers. 'A blind man has always vague, suspicious, and black forebodings engendered by the darkness and loneliness of his life. I am no exception,' he sighed. 'I think ever of the might-have-beens.'

'No, dear,' exclaimed the girl, bending until her lips touched his white brow softly. 'Forget it all, dear old dad. Surely your days here, with me, quiet and healthful in this beautiful Perthshire, are better, better by far, than if you had been a politician up in London, ever struggling, ever speaking, and ever bearing the long hours at the House and the eternal stress of parliamentary life?'

'Yes, yes,' he said, just a trifle impatiently. 'It is not that. I don't regret that I had to retire, except—well, except for your sake perhaps, dear.'

'For my sake! How?'

'Because, had I been a member of this Cabinet—which some of my friends predicted—you would have had the chance of a good marriage. But buried as you are down here instead, what chances have you?'

'I want no chance, dad,' replied the girl. 'I shall never marry.'

A painful thought crossed the old man's mind, being mirrored upon his brow by the deep lines which puckered there for a few brief moments. 'Well,' he exclaimed, smiling, 'that's surely no reason why you should not go to the ball at Connachan to-night.'

'I have my duty to perform, dad; my duty is to remain with you,' she said decisively. 'You know you have quite a lot to do, and when your mother has gone we'll spend an hour or two here at work.'

'I hear that Walter Murie is at home again at Connachan. Hill told me this morning,' remarked her father.

'So I heard also,' answered the girl.

'And yet you are not going to the ball, Gabrielle, eh?' laughed the old man mischievously.

'Now come, dad,' the girl exclaimed, colouring slightly, 'you're really too bad! I thought you had promised me not to mention him again.'

'So I did, dear; I—I quite forgot,' replied Sir Henry apologetically. 'Forgive me. You are now your own mistress. If you prefer to stay away from Connachan, then do so by all means. Only, make a proper excuse to your mother; otherwise she will be annoyed.'

'I think not, dear,' his daughter replied in a meaning tone. 'If I remain at home she'll be rather glad than otherwise.'

'Why?' inquired the old man quickly.

The girl hesitated. She saw instantly that her remark was an unfortunate one. 'Well,' she said rather lamely, 'because my absence will relieve her of the responsibility of acting as chaperon.'

What else could she say? How could she tell her father—the kindly but afflicted man to whom she was devoted—the bitter truth? His lonely, dismal life was surely sufficiently hard to bear without the extra burden of suspicion, of enforced inactivity, of fierce hatred, and of bitter regret. So she slowly disengaged her hand, kissed him again, and with an excuse that she had the menus to write for the dinner-table, went out, leaving him alone.

When the door had closed a great sigh sounded through the long, book-lined room, a sigh that ended in a sob.

The old man had leaned his chin upon his hands, and his sightless eyes were filled with tears. 'Is it the truth?' he murmured to himself. 'Is it really the truth?'

CHAPTER II.—FROM OUT THE NIGHT.

THERE are few of the Perthshire castles that more plainly declare their feudal origin and exhibit traces of obsolete power than does the great gaunt pile of ruins known as Glencardine. Its situation is both picturesque and imposing, and the stern aspect of the two square baronial towers which face the south, perched on a sheer precipice that descends to the Ruthven Water deep below, shows that the castle was once the residence of a predatory chief in the days before its association with the great Montrose.

Two miles from the long, straggling village of Auchterarder, in the centre of a fine, well-wooded, well-kept estate, the great ruined castle stands a silent monument of warlike days long since forgotten. There, within those walls, now overgrown with ivy and weeds, and where big trees grow in the centre of what was once the great paved courtyard,

Montrose schemed and plotted, and, according to tradition, kept certain of his enemies in the dungeons below.

In the twelfth century the aspect of the deep glen was very different from what it is to-day. In those days the Ruthven was a broad river, flowing swiftly down to the Earn, and forming, by reason of a moat, an effective barrier against attack. To-day, however, the river has diminished into a mere burn meandering through a beautiful wooded glen three hundred feet below, a glen the charms of which are well known throughout the whole of Scotland, and where in summer tourists from England endeavour to explore, but are warned back by Stewart, Sir Henry's Highland keeper.

A quarter of a mile from the great historic ruin is the modern castle, built mainly of stone from the ancient structure early in the eighteenth century, with oak-panelled rooms, many quaint gables, stained glass, and long echoing corridors—a residence well adapted for entertaining on a lavish scale, the front overlooking the beautiful glen, and the back with level lawns and stretch of undulating park well wooded and full of picturesque beauty.

The family traditions and history of the old place and its owners had induced Sir Henry Heyburn, himself a Fellow of the Society of Antiquaries, to purchase it from Lord Strathavon, into whose possession it had passed some forty years previously.

History showed that William de Græme or Graham, who settled in Scotland in the twelfth century, became Lord of Glencardine, and the great castle was built by his son. They were indeed a noble race, as their biographer has explained. Ever fearless in their country's cause, they sneered at the mandates from impregnable Stirling, and were loyal in every generation.

Glencardine was a stronghold feared by all the surrounding nobles, and its men were full of valour and bravery. One story of them is perhaps worth the telling. In the year 1490 the all-powerful Abbot of Inchaffray issued an order for the collection of the teinds of the Killearns' lands possessed by the Grahams of Glencardine in the parish of Monzievaird, of which he was titular. The order was rigorously executed, the teinds being exacted by force.

Lord Killearn of Dunning Castle was from home at the time; but in his absence his eldest son, William, Master of Dunning, called out a number of his clansmen, and marched towards Glencardine for the purpose of putting a stop to the abbot's proceedings. The Grahams of Glencardine, having been apprised of their neighbour's intention, mustered in strong force, and marched to meet him. The opposing forces encountered each other at the north side of Knock Mary, about two miles to the south-west of Crieff, while a number of the clan M'Robbie, who lived beside the Loch of Balloch, marched up the south side of the hill, halting at the top to watch the progress of the combat. The fight began with great fury on both sides. The Glencardine men, however, began to get the upper hand and drive their opponents back, when the M'Robbies rushed down the hill to the succour of the Killearns. The tables were now turned. The Grahams were unable to maintain their ground against the combined forces which they had now to face, and fled towards Glencardine, taking refuge in the Kirk of Monzievaird. The Killearns had no desire to follow up their success any farther, but at this stage they were joined by Duncan Campbell of Dunstaffnage, who had come across from Argyllshire to avenge the death of his father-in-law, Robert of Monzie, who, along with his two sons, had a short time before been killed by the Lord of Glencardine.

An arrow shot from the church fatally wounded one of Campbell's men, and so enraged were the besiegers at this that they set fire to the heather-thatched building. Of the one hundred and sixty human beings who are supposed to have been in the church, only one young lad escaped, and this was effected by the help of one of the Killearns, who caught the boy in his arms as he leaped out of the flames. The Killearns did not go unpunished for their barbarous deed. Their leader, with several of his chief retainers, was afterwards beheaded at Stirling, and an assessment was imposed on the Killearns for behoof of the wives and children of the Grahams who had perished by their hands.

The Killearn by whose aid the young Graham had been saved was forced to flee to Ireland, but he afterwards returned to Scotland, where he and his attendants were known by the name of 'Killearn Eirinich' (or Ernoch), meaning Killearn of Ireland. The estate which he held, and which is situated near Comrie, still bears that name. The site of the Kirk of Monzievaird is now occupied by the mausoleum of the family of Murray of Ochtertyre, which was erected in 1809. When the foundations were being excavated a large quantity of charred bones and wood was found.

The history of Scotland is full of references to the doings at Glencardine, the fine home of the great Lord Glencardine, and of events, both in the original stronghold and in the present mansion, which have had important bearings upon the welfare of the country.

In the autumn of 1825 the celebrated poetess Baroness Nairne, who had been born at Gask, a few miles away, visited Glencardine and spent several weeks in the pleasantest manner. Within those gaunt ruins of the old castle she first became inspired to write her celebrated 'Castell Gloom,' near Dollar:

> Oh Castell Gloom! thy strength is gone,
> The green grass o'er thee growin';
> On Hill of Care thou art alone,
> The Sorrow round thee flowin'.
> Oh Castell Gloom! on thy fair wa's
> Nae banners now are streamin';
> The howlit flits amang thy ha's,
> And wild birds there are screamin'.

Oh, mourn the woe! oh, mourn the crime
Frae civil war that flows!
Oh, mourn, Argyll, thy fallen line,
And mourn the great Montrose!

The lofty Ochils bright did glow,
Though sleepin' was the sun;
But mornin's light did sadly show
What ragin' flames had done!
Oh, mirk, mirk was the misty cloud
That hung o'er thy wild wood!
Thou wert like beauty in a shroud,
And all was solitude.

A volume, indeed, could be written upon the history, traditions, and superstitions of Glencardine Castle, a subject in which its blind owner took the keenest possible interest. But, tragedy of it all, he had never seen the lovely old domain he had acquired! Only by Gabrielle's descriptions of it, as she led him so often across the woods, down by the babbling burn, or over the great ivy-covered ruins, did he know and love it.

Every shepherd of the Ochils knows of the Lady of Glencardine who, on rare occasions, had been seen dressed in green flitting before the modern mansion, and who was said to be the spectre of the young Lady Jane Glencardine, who in 1710 was foully drowned in the Earn by her jealous lover, the Lord of Glamis, and whose body was never recovered. Her appearance always boded ill-fortune to the family.

Glencardine was scarcely ever without guests. Lady Heyburn, a shallow and vain woman many years younger than her husband, was always surrounded by her own friends. She hated the country, and more especially what she declared to be the 'deadly dullness' of her Perthshire home. That moment was no exception. There were half-a-dozen guests staying in the house, but neither Gabrielle nor her father took the slightest interest in any of them. They had been, of course, invited to the ball at Connachan, and at dinner had expressed surprise when their host's pretty daughter, the belle of the county, had declared that she was not going.

'Oh, Gabrielle is really such a wayward child!' declared her ladyship to old Colonel Burton at her side. 'If she has decided not to go, no power on earth will persuade her.'

'I'm not feeling at all well, mother,' the girl responded from the farther end of the table. 'You'll make nice excuses for me, won't you?'

'I think it's simply ridiculous!' declared the Baronet's wife. 'Your first season, too!'

Gabrielle glanced round the table, coloured slightly, but said nothing. The guests knew too well that in the Glencardine household there had always been, and always would be, slightly strained relations between her ladyship and her stepdaughter.

For an hour after dinner all was bustle and excitement; then, in the covered wagonette, the gay party drove away, while Gabrielle, standing at the door, shouted after them a merry adieu.

It was a bright, clear, moonlit night, so beautiful indeed that, twisting a shawl about her shoulders, she went to her father's den, where he usually smoked alone, and, taking his arm, led him out for a walk into the park over that gravelled drive where, upon such nights as that, 'twas said that the unfortunate Lady Jane could be seen.

When alone, the sightless man could find his way quite well with the aid of his stick. He knew every inch of his domain. Indeed, he could descend from the castle by the winding path that led deep into the glen, and cross the narrow foot-bridges of the rushing Ruthven Water, or he could traverse the most intricate paths through the woods by means of certain landmarks which only he himself knew. He was ever fond of wandering about the estate alone, and often took solitary walks on bright nights with his stout stick tapping before him. On rare occasions, however, when, in the absence of her ladyship, he enjoyed the company of pretty Gabrielle, they would wander in the park arm-in-arm, chatting and exchanging confidences.

The departure of their house-party had lifted a heavy weight from both their hearts. It would be dawn before they returned. She loved her father, and was never happier than when describing to him things—the smallest objects sometimes—which he himself could not see.

As they strolled on beneath the shadows of the tall elms, the stillness of the night was broken only by the quick scurry of a rabbit into the tall bracken or the harsh cry of some night-bird startled by their approach.

Before them, standing black against the night-sky, rose the quaint, ponderous, but broken walls of the ancient stronghold, where an owl hooted weirdly in the ivy, and where the whispering of the waters rose from the deep below.

'It's a pity, dear, that you didn't go to the dance,' the old man was saying, her arm held within his own. 'You've annoyed your mother, I fear.'

'Mother is quite happy with her guests, dad; while I am quite happy with you,' she replied softly. 'Therefore, why discuss it?'

'But surely it is not very entertaining for you to remain here with a man who is blind. Remember, you are young, and these golden days of youth will very soon pass.'

'Why, you always entertain and instruct me, dad,' she declared; 'from you I've learnt so much archæology and so much about medieval seals that I believe I am qualified to become a Fellow of the Society of Antiquaries, if women were admitted to fellowship.'

'They will be one day, my dear, if the Suffragettes are allowed their own way,' he laughed.

And then, during the full hour they strolled together, their conversation mostly consisted of questions asked by her father concerning some improvements being made in one of the farms

which she had visited on the previous day, and her description of what had been done.

The stable-clock had struck half-past ten on its musical chimes before they re-entered the big hall, and, being relieved by Hill of the wraps, passed together into the library, where, from a locked cabinet in a corner, Gabrielle took a number of business papers and placed them upon the writing-table before her father.

'No,' he said, running his thin white hands over them, 'not business to-night, dear, but pleasure. Where is that box from the Professor?'

'It's here, dad. Shall I open it?'

'Yes,' he replied. 'That dear old fellow never forgets his old friend. Never a seal finds its way into the collection at Cambridge but he first sends it to me for examination before it is catalogued. He knows what pleasure it is to me to decipher them and make out their history—almost, alas! the only pleasure left to me, except you, my darling.'

'Professor Moyes adopts your opinion always, dad. He knows, as every other antiquary knows, that you are the greatest living authority on the subject which you have made a lifetime study—that of the bronze seals of the Middle Ages.'

'Ah!' sighed the old man, 'if I could only write my great book! It is the pleasure debarred me. Years ago I started to collect material; but my affliction came, and now I can only feel the matrices and picture them in my mind. I see through your eyes, dear Gabrielle. To me, the world I loved so much is only a blank darkness, with your dear voice sounding out of it—the only voice, my child, that is music to my ears.'

The girl said nothing. She only glanced at the sad, expressionless face, and, cutting the string of the small packet, displayed three bronze seals—two oval, about two inches long, and the third round, about one inch in diameter, and each with a small kind of handle on the reverse. With them were sulphur-casts or impressions taken from them, ready to be placed in the museum at Cambridge.

The old man's nervous fingers travelled over the surfaces quickly, an expression of complete satisfaction in his face.

'Have you the magnifying-glass, dear? Tell me what you make of the inscriptions,' he said, at the same time carefully feeling the curious medieval lettering of one of the casts.

At the same instant she started, rose quickly from her chair, and held her breath.

A man, tall, dark-faced, and wearing a thin black overcoat, had entered noiselessly from the lawn by the open window, and stood there, with his finger upon his lips, indicating silence. Then he pointed outside, with a commanding gesture that she should follow.

Her eyes met his in a glance of fierce resentment, and instinctively she placed her hand upon her breast, as though to stay the beating of her heart.

Again he pointed in silent authority, and she, as though held in some mysterious thraldom, made excuse to the blind man, and, rising, followed in his noiseless footsteps.

(To be continued.)

WESTERN WANT AND WANTON WASTE.

By Eustace Miles.

IN England and America the real nature of the 'Yellow Peril' is as yet misunderstood. There have been books and articles written and speeches made to warn us of the certain swamping of the West by the millions of the East. Sometimes it is represented as a military invasion, the resistless hordes of China and Japan pouring over Europe and winning by sheer numbers, organisation, and carelessness of death. Sometimes it is represented as an equally resistless commercial invasion. But even those who have emphasised the latter danger have not put their finger upon the weakness of the West.

It is taken for granted that the Chinese and Japanese are strong commercially because they can live on next to nothing. Some people seriously assert that a tiny quantity of food will keep the Eastern worker hard at work for as many hours as he likes; that somehow the Eastern worker can do much more work, steadier work, better work, more persistent work, with less grumbling, than the white man, as though the Eastern worker were superior to the orthodox law of conservation of energy and could be at the same time underfed yet 'speeded up' indefinitely.

What are the facts?

Scientific investigations have been made by the United States Department of Agriculture. I do not know of any other statistical account of the sort. The conclusion reached is that the diet of the *average* Chinese and Japanese approximates very closely to that of the American standard, the American standard being slightly *higher* than the Eastern, as it is slightly higher also than the European. It must be understood that by 'standard,' when the word is used in reference to diet, theoretical food-value is meant, not price. The scientist considers that a man's 'standard' of food is higher, not because he has paid more for it, but because he has included in it more elements to build the body, repair its waste, give it energy and endurance, and so forth. That is to say, the conclusion reached is that the average Chinese and Japanese diet is rather richer in food-values than the average

American, the actual figures being: American standard men, when engaged in moderate work, one hundred and twenty-five grains of proteid and three thousand five hundred calories (or units of energy); Chinese laundry-workers, one hundred and thirty-four grains of proteid and three thousand five hundred and eighty-five calories.

I do not vouch for the correctness of these figures, nor for the statement that 46 per cent. of the total sum spent on food was paid for animal food. But similar figures applied also to the family of a Chinese dentist and to employés in a vegetable garden. Nor did the report of the United States department bear out the popular fallacy that the Chinese and Japanese live on rice. It appears, on the contrary, that these Eastern people had quite as varied a range of food as the Americans, using thirty-five different food-materials.

It is needless to say that among the extremely poor inhabitants of China and Japan, and among many thousands of others as well in times of famine, this standard is not found. But the report seems to show that this standard is found, and is a typical one, in China and Japan, wherever Chinese and Japanese workers are called upon to show results in work that can be compared with the results of European workers. It seems that, if the report is accurate, the Eastern workman who underfeeds is likely to lessen his output of work, and be unable to compete with the European workman.

In order that there may be no misunderstanding, it will be best to take a concrete example—Japanese beans as against Anglo-Saxon beef. In price beans are far cheaper than beef; in food-value they are—at least theoretically—far superior to beef. They contain more proteid, more material for fat and heat and energy, more calories, when weighed against beef, in their uncooked and unprepared forms. The Anglo-Saxon may get his food-elements from beef, and pay more than a shilling a pound, and yet—again theoretically and by chemical analysis—fare no better than if he got his food-elements from beans, and paid less than twopence a pound.

When the above facts are clearly realised, it is seen how foolish is the talk about the Chinese living on next to no food at all, and doing more work on starvation rations. If the American statistics are correct, the Chinese who work hard do not live on starvation rations. The Chinese and Japanese have an advantage over Western peoples—at least over most of the 'civilised' Western peoples—not so much because they eat less as because they *waste* less. And under the heading of 'waste' we must include not only the use of what might be thrown away, but also the choice of a cheap thing in preference to an expensive thing of similar food-value. It is the thriftiness of the Eastern working-man that so seriously threatens the economical supremacy of the wasteful West.

In the above American investigations, for instance, the actual waste in food in one Chinese family group averaged only 3 per cent., whereas the waste in English and American homes of a like status averaged from 10 to 12 per cent. Not only is there less waste in the garbage-pail, there is more care in the selection of cheap food-bases. Even with the high percentage of animal food, the diet only cost 17·3 cents (less than ninepence) a head per day, mainly because cheap kinds of fish and cheap (but equally nourishing) cuts of meat, &c., were used. This amount—17·3 cents—is 'about 50 per cent. of the sum which has been found in the average of the dietary studies of whites of the same class in the States.' It is only when we see it in contrast to this Oriental thriftiness that we realise clearly the wanton and foolish wastefulness of the West.

It is true that we find wonderful economy practised, for example, by the peasants of France and Germany; but in Europe generally the waste is bad enough. In America it is still worse. The story of the American settlement and 'progress,' if one reads it in this light, teems with stories of wanton waste. Outside the immediate sphere of diet, we hear of forests felled till whole areas were made treeless; more timber was wasted than utilised, brooks were thus dried up, and the country rendered colder and less healthy. Italy under the Romans had the same story to tell, though the waste here was less wanton. And the Americans by slovenly and reckless cultivation also exhausted acres of once productive land. We and they have squandered, and are still squandering, the natural fertilisers of the soil, turning the nitrates into the watercourses, so that—in Victor Hugo's phrase—'pestilence springs from the stream and hunger from the furrow.' It has been said of more than one great empire that it perished for want of men. It would be truer to say that most empires have fallen because of waste of men and materials, the waste being partly due to prosperity and the bad habits which it has bred.

Probably no country has been so absolutely compelled to settle the problems of labour and food-supply by close and pressing necessities as China; and this, which has seemed her curse for centuries past, will prove her blessing in centuries to come. Millions have starved that posterity might be made to think and devise and prevent. Nor are England and America likely to think and devise and prevent till they know what it is to starve. The situation in China has made such questions not merely interesting but literally vital. The problem suddenly and repeatedly pressed home to them for consideration and adjustment has been, 'How may a given amount of work and food be so divided and subdivided as to produce the barest needs of life for the greatest number of human beings?' The Chinese have studied it, Government and people, with more and more success. They have never reached the point where, to millions of human beings, a day's idleness did not mean a day's

abstinence from food. The indescribable and unmentionable horrors of famine, caused commonly by drought over large areas, and repeated with sickening frequency, have indeed kept the poor and the starving always with them, and have made the Chinese among the most economical people in the world.

This is, in the main, the opinion of one who knew his subject well, and I have expressed most of it in his own words. Contrast this almost universal thrift and abhorrence of waste, among the working-classes at least, with the boast of more than one of our Western manufacturers that their fortunes were due to the wasteful habits of the Western people—the poor no less than the rich. Coleman, who made so much money by the mustard that people left on their plates, is not the only instance. No Oriental merchant could say that, for in China and Japan there is remarkably little waste. The white workman spends a large amount of his wages in waste; the Chinaman wastes scarcely anything at all. I can give a pitiful example from what I have observed hundreds of times at the restaurant of which I am managing director. We take great care not only with our cookery, but also with our choice of foods, so that the various dishes shall be nourishing as well as pleasant. In the hurry of business we are bound to serve many helpings direct on the plates. And we have no time to find out exactly how much or how little this or that customer will eat; to be on the safe side we make our helpings rather large. The result is that a customer who is a small eater probably leaves on his plate some of what he was served with. The remains are practically as clean as the part was which he or she ate. The remains almost certainly have not been touched by the fork, and it would not have polluted them to have been touched by the knife. Yet they must, by convention, be regarded as waste. Not one of our employés will touch these remains. We must not use them to make up into other dishes, though we can often use what is left in the large vessel from which the helping was served. What happens to the food left on the plates? It goes into the waste-tub. The poor do not care for it. At the end of the week we can tell to some extent how much food is wasted thus. And I believe that, with proper organisation of the kitchen, the amount that is wasted in this way on plates is ten times as great as the amount wasted in any other way. In some Italian restaurants I know that the food left on plates is regularly made up again, and put into the stock-pot. But in our business, even though we know that the food left on plates may be quite good and clean, we simply dare not use it. There is enough to feed many starving people, but they will have none of it.

It is senseless and wanton waste, careless choice of food, careless use of food, careless destruction of food, prejudiced refusal to eat food, that are the gravest danger to Western civilisation. And the agencies in our midst that are trying to combat it by teaching all about food—its properties, its economical purchase, the cheapest method of preparing it, and so forth—are doing sound and useful service. Such agencies need to be supplemented by a strong ethical crusade to insist on the essential immorality of waste, and by the wisest economic teaching that the future must surely rest with those who use all things wisely and well, and waste only the irreducible minimum.

THE INVISIBLE MARQUIS OF GALLANTREVE.

By Robert Barr.

CHAPTER I.

N a squalid attic on the heights of Montmartre, whose only advantage was the magnificent view over Paris offered by one dingy window, the gay Marquis of Gallantreve lay dying, yet making a joke of death, as he had made a joke of life. If years alone were to be taken into account, the Marquis should have been but little beyond the prime of manhood; but he had well earned his title of 'gay,' had overdrawn his balance at the bank of vitality, and now the foreclosure had come.

Near the head of the bed stood a youth of eighteen, whose eyes were moist, and whose nether lip quivered a little now and then, despite his evident determination to maintain his self-control. His serious expression of countenance showed in striking contrast to the cynical grin which marked with ghastly and incongruous impropriety the pallid lips of the dying man. By the bedside a rough wooden table had been placed, on which stood several bottles of now useless medicine; but the most conspicuous object the table held was a black japanned metal case or box, similar to those in use by lawyers to hold separately the complete papers belonging to the client whose name appears in white lettering on the side of the receptacle. The lid had been thrown back, exposing numerous documents tied together in small bundles.

'Henri, in another hour you will be eleventh Marquis of Gallantreve.' The grimace became more accentuated, as if the man thought he had said something humorous. 'Luckily, it was not possible for me to pawn the title; otherwise, I fear, dear boy, it would have followed the property, leaving you plain Henri Francet.'

'That would not have mattered in the least, father,' murmured the boy. 'I intend to be known hereafter as Maurice Armelin.'

'Ah, you adopt the name of your maternal grandfather, then?'

'Yes, father.'

'After all, Henri—excuse my calling you Henri; you cannot teach old dogs new tricks, especially when the last sands are running—after all, I do not wonder you are ashamed to bear mine.'

'It is not that at all, father. I shall need to work for my bread, and a title would be a hindrance, not a help. Henri Francet has always been associated with the Marquisate of Gallantreve, so I shall abandon both, and take my grandfather's name.'

'I am not so sure, my son, that it is best to throw over the title. It is doubtless of social, and probably of commercial, value, even though it may produce no gold if offered to a pawnbroker. Still, you were always wiser than I, Henri, even when a very small boy. You are like your poor mother in disposition, though you possess the features of the Gallantreves. Do you intend to continue your law-studies after I am gone?'

'If I have money enough I shall do so.'

'Well, my boy, I don't envy you. There won't be much money. If there were a hundred thousand francs still at my disposal, I think I should rise from this bed and enjoy another fling with it. My unfortunate lad, Nature has played a cruel trick on you. The House of Gallantreve has heretofore been preserved because of Providence arranging that every second Marquis should be reasonably sane. The misers and the spendthrifts were alternated with almost mathematical regularity. The revenues of our estate were so great that the saving Marquis always retrieved the errors of the spendthrift Marquis who had preceded him; then, by another law of Nature, the wastrels died young, as I am doing, while the prudent Marquises lived to a good old age. You should have been born in my place; but, alas! two prodigals came in succession. My father quickly squandered all my grandfather had saved, and I believe he alone would have completed our ruin without any aid from me had he not died in a drunken brawl at the age of thirty. I have managed to live fourteen years longer than he did, but I have made the ruin complete. The château in which you were born, and the broad lands over which you rode as a lad, are in the hands of strangers.

'Now, it is about my estate, and about that old scoundrel, Gastyn Maillot, who thinks he owns it, that I wish to speak. Maillot, when a youth, was apprenticed at those ironworks ten miles from the château, and was one of their most skilled mechanics. He was sent to the château to execute some repairs which were to occupy him for a month or six weeks. They tell me he was a very presentable young chap, and must have been about twenty-three or twenty-four years old. I did not see him till long afterwards. I suppose I was rioting in Paris at the time. Among those living at the castle was a girl, a distant cousin of my own, fourth or fifth removed. She was a fool whom your mother had invited, and she fell in love with this scamp of an apprentice. She had a little money of her own, and I suppose that is why Maillot married her, thinking that her gold and the honour of an alliance with our House, even though it was a remote alliance, would help him in business—which it certainly did. The family disowned her, of course, and I understand that Maillot swore picturesquely, like the villain on the stage, that he would encompass our ruin; and doubtless I proved a valuable assistant to him in the game. They tell me he is a very ingenious person, having invented several useful things in iron, and, in the usual novelette fashion, he became a partner in the works, and finally their sole owner. To-day Gastyn Maillot is one of the richest men in France. Quietly he bought up the Gallantreve mortgages, and when his grip was complete he crushed us quite ruthlessly, and now occupies the Château de Gallantreve, and lords it over all the domains thereof.

'And now I come to the point that I wish to impress on you. Our old family *avocat* urged me to take action against Gastyn Maillot. He said there was a flaw in the title; but I was always too indolent or too busy to trouble further about the matter, and when the *avocat* died I was too poor to engage another. I suppose the particulars are all in that box, and perhaps it contains the *avocat's* written opinion regarding the flaw, for he was a methodical old chap, and you will probably find everything arranged there in the most precise order. I have kept the box by me, always intending to examine its contents, but never having the energy to do so.

'Well, Henri, this is a long story, and my breath is growing short; but in any case there's nothing more to tell. There may be enough in that box to wrench the whole estate from the old scoundrel; but even if there's merely ground for an action at law, you may frighten some useful gold out of him in time of need. The wretch got the property for the amount of the mortgages—a mere fraction of its value—and therefore by rights he is in your debt many millions of francs. I hope you will succeed, whether your name is Henri or Maurice.'

. . . . . .

After his father's death the young Marquis set himself resolutely to the task of saving some remnant from the wreck of his father's fortune. At first it seemed that there was no remnant; but a more minute investigation disclosed a certain transaction carried out by his father which filled the young man with both pain and anger. Henri had been gratified to learn that there were no debts, and this almost annulled the disappointment at finding there were no assets. Since the château and land had gone under the hammer, the late

Marquis of Gallantreve found that he could obtain no credit. Henri was too young and too inexperienced even to wonder how his father managed for many years after the *débâcle* to enjoy the splendours of Paris, with apparently ample resources up to the last year of his life. Once or twice the elder man, conscience pricking him perhaps, had explained airily that the jade of Chance, after luring him to his ruin, had now relented, and his great gift as a gambler provided him with an income. This statement proved to be fiction. Henri now learned that his mother, whom he could not remember, had left him an ample fortune, to be paid over to him on the day he was twenty-one. His father and the family *avocat* were joint-trustees of this fund, and until the latter's death it had remained not only intact, but was continually augmenting. The spendthrift Marquis of Gallantreve, finding himself sole trustee, formed an alliance with a money-lender as unscrupulous as himself, a financier well acquainted with the shady corners of the law, and these two now proceeded to make ducks and drakes of the son's legacy. First a nominee of the money-lender was appointed trustee in succession to the *avocat;* then these two, under direction of the financial shark, obtained an order from the court to use a portion of the legacy for educating the lad in accordance with the high position he was to occupy in the world. The two trustees then placed the securities in the hands of the financier, and drew money against them which furnished funds for the continued profligacy of the gay Marquis of Gallantreve.

Young as Henri was, he believed that this transaction would not bear the light of day. He sought and obtained an interview with the money-lender, whom he found to be a very cool, shrewd old villain. The ancient money-lender listened with quiet attention to the case as set forth by the youthful Marquis of Gallantreve. The small, keen eyes of the veteran seemed to probe the inner consciousness of the speaker, who began in tones vibrant with indignation, which under the imperturbable scrutiny gradually calmed down to a more colourless statement of claim, enunciated finally with that precision of language which he knew must be adopted if success were to be expected in the profession of law which he had chosen. He realised instinctively that he was in the presence of a consummate scoundrel, and yet as he went on he saw a glimmer of admiration light up the old man's eyes, although his pallid, wrinkled face remained as inscrutable as ever. The money-lender listened without even a motion of interruption, apparently undisturbed by the terrors of investigation with which this youth threatened him. When he was quite assured that his visitor had completed all he had to say, the old man spoke in a voice of quiet incisiveness:

'I think it likely your action would fail. So far as I am aware, every step taken has been strictly legal. I hold receipts signed by your two trustees for every franc paid over to them. The securities are completely at your disposal the moment you reimburse me of the money I have advanced, with the accruing interest, and the proper costs for making the transfer.'

'Sir, you know that is impossible, as my father has left me penniless. But you also know that there has been a conspiracy to which you will probably be adjudged a party. However accurate your documents may be, and however genuine the signatures attached to them, there are, nevertheless, as you are aware, courts which will probe behind all this, and see that substantial justice is done. The patrimony intended for me seems to have been largely squandered through your connivance, and I shall appeal to the proper tribunal for justice.'

'You make a very serious charge against me, my lord Marquis,' said the ancient usurer, quite unmoved—'a charge which, if unsupported by sufficient proof, would place you in great jeopardy, even in peril of your liberty. Let me tell you, however, so that we need not waste further time in fruitless discussion, that even were the proof in your hand you would not use it. I have not the slightest fear that you will bring an action against me.'

'Why?'

'Because, to succeed, you must first prove that your father was a despicable swindler.'

A flush overspread the countenance of the lad, and he sat there for a few moments in silence. Then he rose to his feet. 'You are quite right, sir,' he said slowly, 'and perfectly safe. I wish you good-morning.'

'One moment, Monsieur le Marquis. Your father made to me a promise which he did not keep. Are you prepared to cancel his obligation?'

'I told you, sir, I was penniless.'

'It is not a question of money, but of a signature. I undertook to pay your father in cash one quarter of the legacy, and this I paid with the exception of twenty-three thousand francs. I withheld that sum, informing him that it would be paid the moment he kept his promise, but this he never did.'

'What was the promise?'

'The late Marquis undertook the explanation of our bargain so far as you were concerned, and guaranteed that you would sign a certain document which has long been prepared for your inspection. If you sign it now I shall hand you my cheque for twenty-three thousand francs.'

'It would be a foolish expenditure of money, sir. I, being a minor, can execute no document which would possess legal value.'

'I am well aware of that; nevertheless, this instrument would be evidence that I had insisted on your knowing what was going forward. Will you redeem your father's promise, Marquis?'

'Yes.'

The money-lender touched a button, and his assistant appeared, received a curt order, withdrew, and returned, accompanied by another man. He placed a legal-looking paper before his master, who, adjusting his spectacles, read it carefully.

'Will you examine it, Marquis?' he asked after he had finished the perusal.

'It is not necessary,' said the boy. 'I will sign anything that will keep my father's name out of this business.'

He attached his signature, and the two others signed as witnesses; then the capitalist offered him a cheque which, for a moment, the young man hesitated to accept; yet, after all, it was but a minute portion of a sum that had rightfully been his, so he took it, placed it in his pocket, and withdrew.

Henri Francet left the house of the money-lender more than ever determined to abandon the name that was legally his. The Marquis of Gallantreve must disappear, and Maurice Armelin, student-at-law, should exist in his stead. So far as he knew, there were no relatives on either father or mother's side to make inquiry for him, and the world at large cared nothing for the personality of a pauper. Whatever fame he might achieve, or wealth acquire, would be due to his own exertions. Neither ancestry nor influence should count in his future career. The twenty-three thousand francs, he estimated, would see him through his legal studies. He removed himself from the hateful memories of the attic in Montmartre, and took an equally frugal chamber near the Sorbonne. Here he economised and worked hard, acquiring a training in the process such as none of his race had ever before received. He learned slowly, but what he got he kept, and his instructors were unanimous in prophesying for him a safe but not a brilliant career when the time came to make use of his knowledge.

Several years passed before he opened the iron box which contained the documents that formed the only legacy left him by his father. He had determined not to touch these papers until his acquaintance with law was advanced far enough to ensure the discovery of the flaw, if such flaw existed. Maurice studied the case for months until he was familiar with every intricacy of the situation. Towards the end of his investigations a personal crisis began to call attention to itself with such insistence that it soon obliterated all thoughts of future actions at law. He began to see that, in spite of economy, the money would be exhausted before his legal studies were finished. He must have another two thousand francs, possibly three thousand, and during all his years of work he had made no acquaintances from whom he could borrow a gold piece. Every man he knew was as poor as himself. If he could not get money, and that immediately, all chance of a career was at an end. He pondered bitterly on his own inability to do any useful thing for which people would pay. It was true that, stalwart as he knew himself to be, he could earn a pittance as a farm-labourer, the most poorly paid occupation in all France, and yet the very occupation on which its prosperity is founded. As a lad, motherless, thrown on his own resources in a huge and lonesome château, his father absent in Paris, the boy had worked with great vim on Josslyn's farm. Josslyn was a young man himself at that time, newly married, although he seemed a veteran to the boy. The large farm had been tilled by a Josslyn for almost as far back as the lords of Gallantreve had held the property. The Josslyns were a thrifty, hard-working race, reputed to be wealthy as peasants go. Maurice, as he sat pondering in the dark, smiled sadly to think that, if the worst came to the worst, Josslyn might engage him as a helper on part of the land that the Gallantreves had owned. To his work on that farm his rude health was largely due. The wholesome outdoor life and the exercise had given him a physique which boys of his age had not acquired by bending over desks in schools. He sighed as he remembered Josslyn and his farm, and an overpowering longing to see the scene of his youthful activities overcame him: the broad, fertile fields, the well-stocked barns, the wooded valley through which the clear little river ran, the comfortable homestead, and the glorious meals made memorable by sharp hunger. Madame Josslyn had been assistant-cook at the castle before she married the young farmer, and the abundance of the farm-cuisine, together with its excellence, made strong appeal to one who was half-starving in Paris.

Then like a flash there came to him the knowledge that he had something to sell, and that something a vendible article that the rich man concerned would be most eager to buy once he knew of its existence. He (Maurice) had signed away his mother's patrimony to bring him thus far with his studies. To complete them he would sacrifice all hope of recovering the home of his fathers. He would take to that old ironmaster, who now inhabited the château, the letter which the family *avocat* had written years before to his careless father, assuring him of success if he brought action against the present holder of the Gallantreve domain. He would say to Gastyn Maillot, 'There is the danger in which you stand. Give me Josslyn's farm, a mere fraction of the province you own, and I will assure you a quiet possession and a clear title to all the rest.'

The more he thought of this plan the more it appealed to him. The rent Josslyn paid would secure board and lodging for him until he finished his course, and support him in reasonable comfort during the first barren years of practice. If he succeeded in his profession he would give to Josslyn and his wife this farm for their own. If he failed utterly, the property would be a haven of refuge when Paris had cast him out, a failure.

(To be continued.)

CONCERNING CERTAIN APPARITIONS.

By Frances M'Laughlin.

THE word occultism has been a bugbear to many persons, has terrified many others, and has, so to speak, been shuffled past on the other side by a multitude who cared neither to deny nor affirm manifestations they admitted they could not understand. Yet it is worth while to note that centuries ago the authors of the Nicene Creed professed their belief in 'one God, the Father Almighty, Maker . . . of all things visible and invisible;' while Shakespeare, speaking long afterwards by the mouth of Hamlet, declared:

> There are more things in heaven and earth, Horatio,
> Than are dreamt of in your philosophy.

But at last the time seems to have come when certain things which have never been set down in print before may stand a chance of being treated less cavalierly than has often been the case; and these things I may venture to call personal experiences, because they have either come within the direct cognisance of the writer or have been received from intimate personal friends to whom they occurred. Thus, whatever else may be urged against them, they are, at any rate, first hand; though I offer them not so much as dogmatic facts—which in a certain sense they are—but as a small contribution to a subject which is agitating many persons' minds, and as factors which may contribute something to our knowledge of it.

Now, when people speak of an apparition they usually refer to some more or less materialised object which manifests itself to consciousness by the sense of sight. Thus we popularly speak of seeing—not of hearing, or tasting, or smelling—a ghost; but this, surely, is a very limited definition, and a little reflection will show that, if we are prepared to admit such appeals to one sense, we must in fairness extend the possibility of them to other senses; and of this extended appeal there do in fact exist many instances. Some of my instances, indeed, tend to show this, though at the same time there is no doubt that the commonest kind of occult manifestation is an appeal to the sense of sight, in the form of the appearance of some friend or relative recently dead or on the point of death. There exists so much evidence on this point that even sceptical persons hesitate altogether to deny the possibility of such manifestations; and as each added link tends to lengthen a chain, so each fresh instance of abnormality helps to confirm the examples already recorded.

Now, some years ago the writer was attending morning service in a well-known church near Manchester, where a popular evangelical preacher then drew large congregations. He was concluding his sermon before proceeding with the Communion service, when a sudden commotion arose in the pew immediately in front of the one where the writer sat. There were pews in churches in those days—pews with cushions, and tall hassocks, and doors opening on to the aisle, shutting up each little family in its special bit of privacy. The family in question then consisted of a father, mother, and two daughters, who simultaneously glanced at one another and at the pew-door; and while the father rose and stepped out into the aisle, holding the door open, the others moved up closer together, as though to make room for some one to enter. These proceedings attracted the attention of all the neighbouring worshippers, who were puzzled by them, because they saw nothing to account for the unwonted stir, and they wondered still more when, presently, the father stepped quietly back and resumed his seat.

Later came the explanation. There was a son in the navy, whose ship had been ordered home from the West Indies, and who in his last letter had mentioned the date of his departure, adding that he should be at home before another letter could reach his parents. He told them that he expected to land about a certain date, and if it were Sunday when he arrived, and he did not find them at home, he would come on to church and join them at the Communion service. Thus, half expecting and half not expecting him, the entire family suddenly saw him standing at the pew-door as though waiting to enter, so real being the illusion that his father actually got up to let him in. But alas for the anticipated reunion! By-and-by arrived news that the young man had been stricken down by fever just before his ship sailed, had been left behind in hospital, and had died at the same hour, allowing for the difference in time, as he appeared to his family.

Again, in the Lowlands of Scotland stood an old manor house where the owner's wife was on her deathbed. The ancient furniture still remained in the room, so the invalid lay in a four-post bed, with curtains all round it, wherein many generations of the family had been born and died. The curtains were drawn at its foot and on the side nearest the wall, but they were open on the other to a blazing fire, before which sat an attendant nurse. A tall screen on her left hand shielded her from the draught from a door, whose top was visible above it; and as the nurse sat there she became conscious that the door was opening, and that a hand seemed to rest for a moment on the top of the screen. Presently, as she watched, half-paralysed with fear, a figure appeared from behind the screen—the figure of a young woman clothed in a sacque of rich brocade, over a pink silk petticoat, and wearing a head-dress of the time of Queen Anne. This figure

advanced with a gentle undulating movement to the bed, and bent down over it. Then the nurse jumped up and stretched out her hand to the bell-pull; and, lo! when she looked again the figure had vanished, and her patient lay there dead, with an expression of rapturous content on her sunken face.

Later, when the last sad rites had been accomplished, this nurse wandered into the picture gallery in company with the housekeeper, and, pausing before a certain portrait, exclaimed that there was the original of the unknown lady. 'Ah!' came the answer, 'that lady lived here when Queen Anne was on the throne. They say she had a sad life with her lord, and died young. Ever since she is believed, when the mistress of the manor dies, to appear beside the bed, and—and'—— 'You need not tell me more,' said the nurse, 'for I also have seen her.'

There is an element in my next instance which renders it still more extraordinary. Four ladies, well known to the writer, women of exemplary life and sincere piety, trained in experience of life, prone to take things soberly and seriously, and quite unlikely to allow their imaginations to run away with them, started some few years ago on a tour in Germany. They were at the Dom Hotel at Cologne when the following experience befell them. They occupied two double-bedded rooms *en suite*, communicating by a door, which they left open; and, being tired after their journey, they went to rest early, and were soon asleep. In the early morning hours one of the ladies was awakened by a bright light that seemed to shine across the foot of her bed, which stood in one corner of the room, between the window and the wall; and as she collected her senses, dulled by sleep, she became conscious of a small window high up, near the ceiling, through which the light that had awoke her appeared to be streaming. Yet she felt sure that no window was visible when she went to bed. The light, however, was steady and persistent, and presently she woke her friend, who, of course, saw it also. Their whispered questioning roused their friends in the next chamber, and presently all four travellers were contemplating the mysterious light. After a time one bolder than the rest volunteered to mount on the foot of the bed and try to discover whence the illumination came. The window was described to me as being like one of those casements filled with tiny squares of glass which may sometimes be found still in ancient houses lighting a room from a staircase or passage. Standing on the bed on tiptoe, she could just manage to peep through it, and to see far below a large baronial hall, carpeted with rushes, and with long trestle tables running from end to end, on which still lay the remains of a rude feast. In the centre, between the tables, stood a stained and dirty pair of a men's heavy jack riding-boots. But of human life there was no trace; neither was there any visible source of the light which illuminated the hall and poured through the small window in their room. Time passed. Still the light shone; still the hall remained empty. At last the lookers-on decided it was useless to keep longer vigil. They woke in the morning, to find a blank wall where all four could certify a window had been during the night, and nothing whatever abnormal in their surroundings.

A year or two afterwards there appeared a paragraph in *Modern Society* which ran somewhat as follows: 'The old Dom Hotel at Cologne is about to be pulled down. Now, perhaps, we shall arrive at a solution of the mystery which has always attached to it.' I forget the exact date of this paragraph, and it will be noticed that the supposed mystery is but vaguely referred to; still, I have always wondered whether it was in anywise connected with my friends' experience, and if so, what could have been its cause and origin. It would be most interesting to know whether or not theirs is a unique experience, or whether other visitors to the Dom Hotel have had a similar one.

I pass on now to a case where appeal was made to the ear as well as the eye. It occurred at the deathbed of a lady very well known to me. This lady had lost the husband of her youth years before, and after a period of widowhood had married a second time when fairly advanced in life. Yet, whereas she had lived but nine years with her first husband, she had overpassed her silver wedding with the second. He predeceased her by six months only, and then she, herself worn out by a lingering illness, approached the brink of the grave. She had lain, apparently unconscious, for some days, so weak that she could not raise herself in bed. Suddenly—it was one bright July Sunday, and the sun was streaming into her room—she sat upright, staring with a fixed and absorbed expression at one corner of the ceiling. Then she spoke clearly and distinctly, and for the last time, 'Yes, James, yes! I am coming,' and with that joyous cry sank back on her pillows and died. And the children gathered round her bed knew she had seen and answered to the husband of her youth, who had passed from her so many years before.

But the following experience is even more remarkable, inasmuch as the apparition, if such it were, was seen by two persons separated by a considerable distance, at almost the same time, and not only manifested itself to the eye but addressed itself also to the sense of hearing.

A lady, who had been a widow for some years, suffered from a severe illness which required the services of a nurse, and brought her almost to death's door. She lay thus one evening, too weak to care what happened to her, too lonely in spirit, even, to dread the loneliness of the great change. The nurse had left the room for a moment, when the invalid's attention was attracted by steps coming along a passage running the entire length of the house, which seemed to pause at her door. It opened

slowly, and her husband, who had died fifteen years before, came in. He stood beside the bed, looking down at her; then, to her amazement, he spoke. 'Don't feel lonely,' he said; 'remember I am always near you. I am always watching over you. You are never alone.' Then he seemed to lay his hand on hers, which hung listless outside the counterpane; but when she recovered from her surprise, and would fain have spoken more with him, he was gone.

Now follows the most curious part of the story. An old servant, dating from the lady's married life, who had been summoned to help with the nursing, was sleeping at the other end of the passage. She awoke from her first sleep with a start, to recognise the figure of her old master standing beside her bed. 'Take care of the mistress, Mary; take care of the mistress,' were the words which fell distinctly on her ear. And then she also watched the figure fade away, and heard retreating steps along the passage.

When mistress and maid met next morning they looked searchingly at one another before the mistress spoke. 'Did you—hum—see anything last night, Mary?' came the question at last. 'Well, marm, since you press me, I thought I saw the old master; but I dare say it was fancy, for—for'—— 'No, it was not fancy,' came the unexpected answer; 'for I saw him also, and heard his voice, and felt his touch.' This story, however, has a happy ending, showing thereby that an apparition does not necessarily mean disaster, for the invalid recovered from the depths of despair through this knowledge of an ever-watchful love which could endure beyond death and the grave.

But the writer has heard also of a couple of instances where supernatural manifestations were made to the sense of hearing alone; and as both were on almost identical lines, the record of one is in all essential points the record of the other.

In an old book, not so well studied nowadays as it used to be, we read of 'a voice in heaven which was as the voice of harpers harping with their harps;' and this idea of the existence of celestial music has long been interwoven with religious belief. But it does not fall to the lot of every one to be acquainted with two people who claim to have actually heard it. One of them tells the story as follows: A woman lay on her deathbed, a good old woman of lowly rank, who had humbly and faithfully striven to do her duty in that station of life in which it had pleased God to place her. A like-minded friend sat by her bedside. It was midsummer, the day had been hot and sultry, and Nature, listless and exhausted by the warmth, was preparing for her night's repose. Through the open window came the hushing sound of her myriad voices; but mingling with them came also a faint, very faint, strain of music indescribably sweet and melodious. Yet, as it drew near and nearer, it was like no music known on earth, and it grew louder while the woman listened, the watcher hearing it as distinctly as she who lay on the bed. The music appeared to float gradually on, increasing in volume as it came, until it filled the chamber, seeming for a space to hover above it. In that space the invalid, with a deep sigh of contentment, passed away; and accompanying, as it were, her spirit went the music, fading soft and softer into the distance, until it faded quite away. 'Angel music' my friend called it; and when I pressed for fuller information she replied, 'Well, it was more like the music of harps than anything I can compare it to, and yet it was far above and beyond any harp-music I ever heard. Such music I never even imagined before.'

Finally, I have cognisance of certain cases, though rare ones, where nothing could be seen or heard, and the appeal seemed wholly to the sense of smell. I know of a faint yet distinct odour of lavender clinging about a room where many generations have been born and died, yet where no lavender has ever been known to be; of another chamber where a scent of musk can frequently be appreciated; of a third where violets might once have hidden themselves. And all these essences are fugitive and intermittent, and not recognised by every visitor. Who can tell, in the passage of years, how they first became frequent? for the houses they haunt are all old, and their full story unrecorded.

But, indeed, who knows how or by what means any of the things I have set down could happen? Who as yet can explain them? Explain them! 'Ay,' as Hamlet says, 'there's the rub!'

THE STOPPING OF DAGENHAM BREACH.

DURING the last few months the passing of a historic river-side hotel, the 'Ship,' at Greenwich, has called forth many reminiscences concerning the celebrated Ministerial Whitebait Dinner at the end of each session, with which its name was intimately associated for a long period of years. All accounts, however, appear to have missed the true genesis of those defunct festivals, which—originally purely gastronomic meetings—by degrees assumed, in consequence of the long reign of the Tories, a political or semi-political character. They are said to have begun at the end of the eighteenth century through a princely merchant inviting Mr Pitt and his colleagues to dine at Dagenham, in Essex, where the host had a fishing-cottage. This is true enough, but it does not explain the origin

of the Dagenham dinners. It may be news to many to learn that the latter were the outcome of a notable engineering achievement accomplished in the reign of George I., a feat that then made as much noise as any great engineering work of our day. Therefore, the Whitebait Dinner owed its existence to the work in question—the stopping of Dagenham Breach.

In the sea-wall that protected the marshes of Essex, near the villages of Dagenham and Havering, a very destructive breach was set up by the violence of the wind and tide on the night of the 17th December 1707. The mischief originated with the blowing up of a small sluice which had been made one hundred and twenty years previously for the drainage of the land-waters; and this having been at first neglected, an opening was formed in some places twenty feet deep and one hundred yards wide. Through this channel the rush of waters was so great that upwards of one thousand acres of rich land, worth three pounds per acre, in the Dagenham and Havering levels were inundated, and one hundred and twenty acres washed into the Thames, where a sandbank was formed about a mile in length and reaching nearly across the river. The expense of repairing this breach was at first laid upon the landowners, who indulged in various costly and fruitless attempts, extending over a number of years. The danger, however, resulting to the navigation of the river eventually occasioned an application to Parliament, and in the twelfth of Queen Anne an Act was obtained to continue the work, a small tax being at the same time laid on every vessel coming into the port of London, for a period of ten years from the 10th July 1714, for the purpose of defraying the expense.

The trustees appointed by the Act for the superintendence of the work invited tenders. An engineer named John Perry offered to undertake it for twenty-five thousand pounds, but the contract was given to a Mr Boswell, who asked only sixteen thousand three hundred pounds. The latter found his task impossible, and failed within a year. The work was then entrusted to Perry in 1715, who completed it successfully in five years' time.

This John Perry was a remarkable man in his way. He started his career as an officer in the navy, where his engineering talents soon asserted themselves, for he invented a kind of floating dock which was used at Portsmouth in the repair of men-of-war. In 1690 he lost the use of his right arm in action. In September 1693 he was in command of a fire-ship attached to the frigate *Diamond* when both vessels were captured by two large French privateers off Cape Clear. Concerning the blame of this affair mutual recriminations ensued between Captain Wickham, of the *Diamond*, and Perry. The latter was court-martialled on charges of cowardice and disobedience, found guilty, and sentenced to a fine of one thousand pounds and ten years' imprisonment. He was, however, released in 1698, and introduced by Lord Carmarthen to the Czar Peter, then on a visit to England. Peter, hearing of Perry's engineering aptitude, engaged him to go out to Russia to superintend the naval and engineering works then under progress in that country. Perry constructed a canal between the rivers Volga and Don, and built quays, docks, and arsenals in St Petersburg. During the fourteen years he served the Great Peter he received only one year's salary. His return home in 1712 was actuated by the circumstance of his life being in danger, owing to his importunity in demanding his arrears of salary.

Soon after he reached England, Perry became greatly interested in the Dagenham Breach problem. He visited the scene of operations, and has left an amusing account of the landowners' unskilful efforts to stop the breach. Their *modus operandi* was to sink old warships in the river just outside the breach—not a piece of which vessels was to be seen at the next ebb of the tide—and to dump bags filled with chalk and earth in the channel itself. It was common for men to stand in great numbers day and night upon every reflux of the tide up to the middle in water, which resulted in the loss of many lives. Once, by a special effort, a wooden caisson eighty feet in length was constructed, filled with chalk and stones, and sunk across the breach. But the tide worked strongly underneath the caisson, and up it came, its violent plunges causing it to be considerably lightened. It then broke loose and floated down the river, alternately sucked below the surface of the water and rising high above it, to fall over with a great crash. In the caisson's mad career it played havoc among the small craft lying off Gravesend.

Boswell's scheme was to dam the influx of water some little distance above the breach by means of loaded chests, sixty feet long, thirty feet broad, and twenty feet deep, having flat bottoms and prow-shaped ends. The chests were put together at Vauxhall. Boswell went bankrupt within a year, and his scheme was foredoomed to failure. Perry's original contract was accepted on the 26th January 1715, at which period the breach had been worn into several large branches, like the natural arms of a river, by the force of the reflux water from the marshes at every turn of the tide. The longest of these branches extended upwards of a mile and a half, and was in some places from four hundred feet to five hundred feet broad, and from twenty to forty feet deep. The contractor stipulated to repair the breach and make good the river-wall for two hundred yards on each side before the 1st November 1717; and within eighteen months, to commence from the 23rd April 1718, to remove the sandbank. The crux of Perry's plans was the formation of a dam across the breach itself, the body composed entirely of good clay, with a row of dove-tailed piles of fir-timber, which his Russian experience had taught him would swell and grow tight, driven

through the middle to secure the foundation. Among his other expedients were a network of channels and an elaborate system of sluice-gates to carry off the flood-water.

By the foregoing methods this indomitable engineer, after extraordinary exertions, at length succeeded in stopping the breach, but not before the works had been three times nearly destroyed and washed away by the strength and rapidity of the tides. The first catastrophe, on the 10th September 1717, and the last, on the 30th September 1718, both appear to have been due to the stupidity or treachery of the watchmen at the sluice-gates during Perry's enforced absence owing to illness. He had, indeed, many difficulties to contend with. Bad clay was imposed upon him, and his decision to pay his men by piecework instead of by the day or tide caused an endless succession of strikes, though many of the navvies were earning from thirty to thirty-six shillings per week. In the summer of 1719 the dam was finished, its dimensions being as follows: width, one hundred and eighteen yards; breadth at bottom, one hundred and fifty feet; breadth at top, thirty-six feet; height from foundation to low-water mark, one hundred and four feet; height from the bottom of the breach at its deepest place, forty-two feet. Perry then turned his attention to the sandbank, the removal of which was accomplished in two years. The expense of the entire undertaking amounted to forty thousand four hundred and seventy-two pounds eighteen shillings and eightpence three-farthings, only twenty-five thousand pounds of which was allowed by original contract; but the sum of fifteen thousand pounds was afterwards voted by Parliament to Perry, who was thus ungenerously left to defray a part of the charges and without any remuneration for upwards of five years' anxiety and care. However, Perry had his reward in the prestige which the feat brought him. During the remainder of his life he found profitable employment as consulting engineer to important harbour and drainage works. He died at Spalding, while acting as engineer to a company formed for draining the Lincolnshire Fens, in February 1732.

Within the Dagenham Embankment is yet a lake of between forty and fifty acres, where the earth had been carried off by the tide. This portion of unreclaimed land, which is known as Dagenham Reach, is much frequented by anglers.

For many years after Perry had brought the stopping of the breach to a successful issue, the body of commissioners created by the Act of Parliament continued to hold a meeting on the spot once a year for the purpose of seeing how the work stood the test of time. For their accommodation a small circular thatch building, called the Breach House, was built near the lake, which could not be drained. Nothing is done in England without a dinner, and so the visitation of the Board came in time to be concluded with one, the fare being mainly composed of the excellent fresh-water fish which Dagenham Reach produced. Towards the close of the eighteenth century this annual Board-meeting had become merely a perfunctory affair from the business standpoint, whereas the dinner had developed from a kind of picnic into a banquet, the commissioners having taken to contributing wines, fruit, turtle, venison, &c., to add to the original service of fish. Eventually Sir Robert Preston, Bart., member of Parliament for Dover, who succeeded to the chairmanship, conceived the idea of inviting Mr Pitt to dine with them at the Breach House. The Premier accepted, and was so well pleased with his reception —they were all two, if not three, bottle men—that on taking leave he readily accepted an invitation for the following year. For a few years the Premier continued a visitor to Dagenham; but as the distance was considerable, the going and coming were somewhat inconvenient for the First Minister of the Crown. Sir Robert Preston, however, had his remedy, and he proposed that they should in future dine nearer London. Greenwich was suggested. We do not hear of whitebait in the Dagenham dinners, and its introduction probably dates from the removal to Greenwich. The circle now became wider, and assumed the character of a Ministerial festival, strictly Tory. Pitt's death did not interrupt these festive meetings. When the Whigs came into power they too decided to have an afternoon of whitebait and gaiety, and adopted this measure from their political opponents.

The last of the celebrated Ministerial whitebait dinners, whose origin can thus be traced back to the engineering achievement known by the name of the stopping of Dagenham Breach, was held under the presidency of Lord Rosebery in August 1894.

PRISCILLA'S PSALTER.

It lies within a box of lumber old—
Books, samplers, prints—
A red-bound psalter, tooled and edged with gold
Which faintly glints.

'The Psalms of David, Set for those who Sing.
One, seven, six, eight.
By Doctor Brady, Chaplain to the King,
And Nahum Tate.'

So runs the title-page. And on the marge,
In faded ink,
'Priscilla Preece,' in letters round and large—
Her own, I think.

Just as I think, though why 'twere hard to say,
That she was fair;
And, since the book 's a psalter, gravely gay,
With braided hair.

I cannot deem that she was Mistress Preece
Of strident tongue,
Who found in Tate and Brady righteous peace
The more she sung.

Nay, she was fair! Let that be fact, since we
Will have it so,
To add a beauty to the psalter she
Used long ago.

AN EPISODE OF THE WHITE TERROR.

By Miss BETHAM-EDWARDS.

THE early years of the Restoration afford melancholy reading. Delations, espionage, merciless reprisals, were the order of the day. Vainly we search these annals for the faintest trace of magnanimity or even of moderation. Gouty, infirm, ever under the influence of others, Louis XVIII. allowed the reactionaries or so-called ultras, headed by the Comte d'Artois, afterwards Charles X., to have their way. The White Terror followed. From end to end, the country was terrorised by a rigorous state of siege. So-called Cours Prévôtales were established, empowered to condemn and summarily execute any citizen accused of conspiring against the Government. Drumhead courts-martial, fusillades, imprisonments, exile, recalled the war waged against Protestants a century before.

Sparsely indeed did the better side of humanity glimmer amid prevailing deterioration. Napoleon, as he found to his cost—and curiously enough to his surprise—had morally perverted the French character. When, after Waterloo, one by one, the men he had heaped with wealth and honours deserted him he could not conceal his astonishment and disgust. I say curiously enough, because from so colossal an intellect might have been expected more knowledge of human nature. The sycophants flocking around his successor could hardly be expected to display heroism. Few, very few, instances of nobleness or self-sacrifice light up these dreary annals. One victim after another, his only crime being reckless devotion to a fallen chief, was abandoned alike by kinsmen and friends. Ties of blood were disregarded. Lifelong friendships were cast to the winds. Craven self-interest held sway. Nevertheless, here and there we meet with shining exceptions to the rule, instances of purest devotion and endurance.

Among the condemned of that blood-stained year 1815 was the Comte de Lavalette. Charged with conspiracy, his real offence had been the taking over of postal administration in Napoleon's name during the Hundred Days. More fortunate than most accused persons of the White Terror, Lavalette was not selfishly abandoned to his fate. Every effort was made alike to soften the ordeal of long imprisonment, to obtain his acquittal, and, after condemnation, his pardon.

Here it must be explained that the Revolution had modified prison régime. As in the days of which Helen Maria Williams has told us, political prisoners could follow their avocations and for many hours of the day receive their friends. Later such privileges were withdrawn. Thus Ney, 'the bravest of the brave,' was deprived of his flute, sole distraction whilst awaiting trial. Lavalette, on the contrary, was allowed the company of a faithful friend named Sainte-Rose, the pair amusing themselves with chess, and each day Madame de Lavalette shared her husband's dinner. The death-sentence having been pronounced, another devoted friend, the Duc de Duras, entreated Louis XVIII. to grant Madame de Lavalette an audience. The petition was granted, and here we read of a scene recalling Lord Macaulay's famous page, that description written, in scriptural phrase, 'with a pen of iron, with the point of a diamond,' of Monmouth at the feet of James the Second.

Full of hope, the poor wife flew to the Tuileries, and by the Duke himself was ushered into the royal presence.

In callousness Louis XVIII. equalled his predecessor. 'Madame,' he said, 'I consented to receive you as a mark of personal interest.' So saying, he turned away. Sobbing and murmuring prayers, the unhappy woman remained on her knees. The king uttered no word more. The death-penalty was, therefore, to take effect.*

* In the case of the youthful wife of General Labédoyère, a similar and even more terrible scene had taken place. 'Madame,' said Louis XVIII., 'I can only do one thing for your husband. *I will have masses said for his soul.*' The widow was condemned to pay three francs to each of the firing-party told off to shoot her husband (see Vaulabelle, *La Restauration*, vol. iv. p. 60).

[*All Rights Reserved.*]

Lavalette's friends next sent his case before the Cour de Cassation (Court of Appeal). This step proving equally infructuous, they determined, if possible, to effect his escape. The initiative was taken by a brave *habituée* of the Court, the Princesse de Vandemont, and in the short space of a day—Lavalette was to be shot on the following morning at five o'clock—every detail had been arranged. Besides this lady, several friends were in the plot, one and all, be it remembered, hazarding their lives on the prisoner's behalf. The principal rôles, however, devolved upon Madame de Lavalette and her daughter Joséphine, a child of twelve; and here we come to the most remarkable feature of our story. Not infrequently we read of childish heroism, of juvenile efforts to save some comrade or pet animal from drowning or other catastrophe. Instances in the very young of sustained composure and emotion long suppressed under terrifying conditions are rare indeed.

Picture, then, a convent-bred child suddenly introduced to scenes so strange—instead of classrooms and gardens, soft-voiced nuns and joyous companions, confronting prison walls, iron gratings, and armed jailers, all the while having a part to play, feeling herself the arbiter of her father's fate! It is this situation that renders the little drama of exceptional interest and poignancy.

The plot decided upon was as follows: After the supposedly final farewells, husband and wife were to change outer clothes, the matter being facilitated by various circumstances. In the first place, the season being midwinter, Madame de Lavalette's daily visits were paid in a long fur-lined cloak and hood; secondly, the pair were of similar height and proportions, Lavalette's bulkier size having been reduced by long incarceration and suspense; thirdly, the cell was furnished with a screen behind which Lavalette performed his toilet; and, lastly, perpetual watch was only kept in the corridor on which the door of his cell abutted. For a few minutes from time to time the prisoner daily escaped surveillance. Madame de Lavalette's part would be comparatively easy, as the changing of dress would take place secretly; little Joséphine's part was much more hazardous, each step being beset by pitfalls. Between her father's door and the portal of the Conciergerie several courtyards and passages had to be traversed, each guarded by warders and gendarmes.

It was especially impressed on the little girl that she must change her position on passing from one portion of the prison to another, always contriving, and as if quite naturally, to place herself between her father and his guards.

The fateful evening arrived. Accompanied by an aged woman-servant and the child, Madame de Lavalette visited her husband, as was supposed, for the last time. Just before she retired behind the screen an incident threatened betrayal. Overcome by emotion and the heat of the cell, the old woman began to sob audibly.

'No weakness!' whispered the almost frenzied wife. 'The least noise may cost your master's life. Inhale these salts; in a few minutes you will be in the open air.'

Then, no guard being outside the grating, quick as lightning she passed behind the screen. In a few seconds Lavalette reappeared alone, so completely disguised that the little Joséphine hardly recognised him. On the usual signal being given, the door was opened; and, leaning on his daughter's arm, his head bowed as if overwhelmed with grief, a handkerchief pressed to his eyes, and enveloped in furs, he passed out.

The narrow, ill-lighted corridor offered no difficulties. They next passed into a vast guard-room where five turnkeys were always stationed, their position being to the left. Not forgetting her lesson, Joséphine here took her father's left arm, thus screening him from close observation. Here came a second moment of agonised suspense. The jailers ranged on the opposite side let the pair pass without notice; but as they approached the other end a warder came up and touched Lavalette on the arm.

A cry, a start, on the part of Joséphine would now have proved fatal, but the child's nerve stood her in good stead. Lavalette, although, as he afterwards wrote, convinced that all was lost, also remained calm.

'You are retiring in good time, Madame la Comtesse,' the man said. That was all. We are not told, but probably the interruption arose from self-interest. Perhaps this man, who had seen Madame de Lavalette on former occasions, looked for a parting gift; otherwise, even the most hardened prison official would hardly have reminded a woman so situated of his presence.

Yet another and equally paralysing ordeal forthwith confronted the fugitives. Behind the iron grating leading from the guard-room to the outer courtyard sat another turnkey whose business it was to open the door, and who now eyed the pair without raising his keys. All now seemed lost, but again, remaining outwardly unmoved, Joséphine proved her father's deliverer.

Lavalette had forgotten that it was the custom for his wife to say, 'Open.' Becoming aware of the omission, and summoning all his courage, instead he inclined his head. The heavy door with its iron grating swung back, and father and daughter passed into the courtyard. Here were ranged a score of gendarmes who had witnessed the Countess's arrival two hours before. Remembering her swiftly conned lesson, the child here took Lavalette's right arm, once more being between him and his watchers.

And now the portal was reached, a whiff of fresh air from the open street and the sight of the sedan-chair making the prisoner's heart leap. But just as the last danger seemed overcome, again came a last moment of fearful suspense. True enough there stood the sedan-chair, but both lackey and bearers had disappeared! Incredible

as it may seem, the two apparently interminable minutes that followed did not overcome Joséphine's constancy. Never moving a muscle, the twelve-year-old girl again and for the last time stood her father in good stead. The two agonised minutes seemed hours, but they passed. Man-servant and newly hired porters appeared—presumably tired of waiting, the first pair had gone away—and the chair moved off. Joséphine's mission was accomplished.

. . . . . .

At the corner of an adjacent street Lavalette found himself thrust into a cabriolet and driven away at a furious pace. As soon as he began to breathe freely he recognised in his companion an old friend, the Comte de Chassenon.

'You here?' he asked with surprise.

'Ay; and here are two double-barrelled pistols, of which I hope you will make good use in case of need.'

'Nay,' Lavalette replied, 'I will not prove your destruction.'

'You will just follow my lead,' the other retorted coolly.

In the vehicle Lavalette again disguised himself, this time putting on a groom's livery. By a tortuous route they reached the Rue de Bac; here they alighted, another friend now taking the Count's place. Proceeding on foot, and protected by the obscurity of night, they arrived at the first hiding-place, more than one gendarme in hot pursuit of the fugitive dashing past them on the way.

Meantime all Paris was astir; the city gates were closed; couriers and orders were despatched in every direction. The news of Napoleon's escape from St Helena could hardly have caused more commotion or awakened more violent passions. Not only among Ministers and in political circles, but in society, the most vindictive spirit was displayed. Court ladies, even young girls, frequenters of royal *salons*, cried, 'Is it possible—Lavalette allowed to escape?'

When, after her six weeks' incarceration, Madame de Lavalette returned to her home, she found that the little Joséphine had been expelled from her convent-school. On learning what had happened, alike nuns and their pupils avoided her; parents of pupils informed the Superior that their children would be immediately withdrawn if Joséphine de Lavalette were allowed to remain. We must go back to the lamentable Dreyfus episode a few years ago for an example of similar vindictiveness and class-hatred.

Lavalette's long odyssey was finally brought to an end through English agency. After three weeks' hiding in the house—strange to say—of a Government official, three English officers lent their services. Wearing the uniform of a guardsman and accompanied by two of the Englishmen, he safely crossed the frontier, reaching Bavaria. In 1822 the refugee was pardoned and permitted to return to France. He died in Paris a few years later. His *Mémoires* were published in two volumes in 1833. Less happy than her husband, Madame de Lavalette never recovered from the tension of that terrible night and the six weeks' rigorous imprisonment that followed. Her reason became affected. The after-fortunes of her brave little daughter have not been chronicled.

THE HOUSE OF WHISPERS.*

CHAPTER III.—SEALS OF DESTINY.

TEN minutes later she returned, panting, her face pale and haggard, her mouth hard-set. For a moment she stood in silence upon the threshold of the open doors leading to the grounds, her hand pressed to her breast in a strenuous endeavour to calm herself. She feared that her father might detect her agitation, for he was so quick in discovering in her the slightest unusual emotion. She glanced behind her with an expression full of fear, as though dreading the reappearance of that man who had compelled her to follow him out into the night. Then she looked at her father, who, still seated motionless with his back to her, was busy with his fingers upon something on the blotting-pad before him.

In that brief absence her countenance had entirely changed. She was pale to the lips, with drawn brows, while about her mouth played a hard, bitter expression, as though her mind were bent upon some desperate resolve.

That the man who had come there by stealth was no stranger was evident; yet that between them was some deep-rooted enmity was equally apparent. Nevertheless, he held her irresistibly within his toils. His clean-shaven face was a distinctly evil one. His eyes were set too close together, and in his physiognomy was something unscrupulous and relentless. He was not the man for a woman to trust.

She stepped back from the threshold, and for a few seconds halted outside, her ears strained to catch any sound. Then, as though reassured, she pushed the chestnut hair from her hot, fevered brow, held her breath with strenuous effort, and, re-entering the library, advanced to her father's side.

'I wondered where you had gone, dear,' he said in his low, calm voice, as he detected her presence. 'I hoped you would not leave me for long, for it is not very often we enjoy an evening so entirely alone as to-night.'

* Copyright in the United States of America by the Authors' and Newspapers' Association, New York, 1908.

'Leave you, dear old dad! Why, of course not!' She laughed gaily, as though nothing had occurred to disturb her peace of mind. 'We were just about to look at those seals Professor Moyes sent you to-day, weren't we? Here they are;' and she placed them before the helpless and afflicted man, endeavouring to remain undisturbed, and taking a chair at his side, as was her habit when they sat together.

'Yes,' he said cheerfully. 'Let us see what they are.'

The first of the yellow sulphur-casts which he examined bore the full-length figure of an abbot, with mitre and crosier, in the act of giving his blessing. Behind him were three circular towers with pointed roofs surmounted by crosses, while around, in bold early Gothic letters, ran the inscription:

✠ S . BENEDITI . ABBATIS . SANTI . AMBROSII . D' RANCIA ✠

Slowly and with great care his fingers travelled over the raised letters and design of the oval cast. Then, having also examined the battered old bronze matrix, he said, 'A most excellent specimen, and in first-class preservation, too! I wonder where it has been found. In Italy, without doubt.'

'What do you make it out to be, dad?' asked the girl, seated in the chair at his side and as interested in the little antiquity as he was himself.

'Thirteenth century, my dear—early thirteenth century,' he declared without hesitation. 'Genuine, quite genuine, no doubt. The matrix shows signs of considerable wear. Is there much patina upon it?' he asked.

She turned it over, displaying that thick green corrosion which bronze acquires only by great age.

'Yes, quite a lot, dad. The raised portion at the back is pierced by a hole very much worn.'

'Worn by the thong by which it was attached to the girdle of successive abbots through centuries,' he declared. 'From its inscription, it is the seal of the Abbot Benedict of the Monastery of St Ambrose, of Rancia, in Lombardy. Let me think, now. We should find the history of that house probably in Sassolini's *Memorials*. Will you get it down, dear?—top shelf of the fifth case, on the left.'

Though blind, he knew just where he could put his hand upon all his most cherished volumes, and woe betide any one who put a volume back in its wrong place!

Gabrielle rose, and, obtaining the steps, reached down the great leather-bound quarto book, which she carried to a reading-desk and at once searched the index.

The work was in Italian, a language which she knew fairly well; and after ten minutes or so, during which time the blind man continued slowly to trace the inscription with his finger-tips, she said, 'Here it is, dad. "Rancia, near Cremona. The religious brotherhood was founded there in 1132, and the Abbot Benedict was third abbot, from 1218 to 1231. The church still exists. The magnificent pulpit in marble, embellished with mosaics, presented in 1272, rests on six columns supported by lions, with an inscription: '*Nicolaus de Montava marmorarius hoc opus fecit.*' Opposite it is the ambo (1272), in a simple style, with a representation of Jonah being swallowed by a whale. In the choir is the throne adorned by mosaics, and the Cappella di San Pantaleone contains the blood of the saint, together with some relics of the Abbot Benedict. The cloisters still exist, though, of course, the monastery is now suppressed."'

'And this,' remarked Sir Henry, turning over the old bronze seal in his hand, 'belonged to the Abbot Ambrose six hundred and fifty years ago!'

'Yes, dad,' declared the girl, returning to his side and taking the matrix herself to examine it under the green-shaded reading-lamp. 'The study of seals is most interesting. It carries one back into the dim ages. I hope the Professor will allow you to keep these casts for your collection.'

'Yes, I know he will,' responded the old Baronet. 'He is well aware what a deep interest I take in my hobby.'

'And also that you are one of the first authorities in the world upon the subject,' added his daughter.

The old man sighed. Would that he could see with his eyes once again; for, after all, the sense of touch was but a poor substitute for that of sight!

He drew towards him the impression of the second of the oval seals. The centre was divided into two portions. Above was the half-length figure of a saint holding a closed book in his hand, and below was a youth with long hands in the act of adoration. Between them was a scroll upon which was written: 'Sc. Martine O.P.N.,' while around the seal were the words in Gothic characters:

✠ SIGIL . HEINRICHI . PLEBANI . D' DOELSC'H ✠

'This is fourteenth century,' pronounced the Baronet, 'and is from Dulcigno, on the Adriatic—the seal of Henry, the vicar of the church of that place. From the engraving and style,' he said, still fingering it with great care, now and then turning to the matrix in order to satisfy himself, 'I should place it as having been executed about 1350. But it is really a very beautiful specimen, done at a time when the art of seal-engraving was at its height. No engraver could to-day turn out a more ornate and at the same time bold design. Moyes is really very fortunate in securing this. You must write, my dear, and ask him how these latest treasures came into his hands.'

At his request she got down another of the ponderous volumes of Sassolini from the high shelf, and read to him, translating from the Italian the brief notice of the ancient church of Dulcigno, which, it appeared, had been built in the Lombard-Norman style of the eleventh century, while the campanile, with columns from Pæstum, dated from 1276.

The third seal, the circular one, was larger than

the rest, being quite two inches across. In the centre of the top half was the Madonna with Child, seated, a male and female figure on either side. Below were three female figures on either side, the two scenes being divided by a festoon of flowers, while around the edge ran in somewhat more modern characters—those of the early sixteenth century—the following:

✠ SIGILLVM . VICARIS . GENERALIS . ORDINIS . BEATA . MARIA . D' MON . CARMEL ✠

'This,' declared Sir Henry after a long and most minute examination, 'is a treasure probably unequalled in the collection at Cambridge, being the actual seal of the Vicar-General of the Carmelite order. Its date I should place at about 1150. Look well, dear, at those flower garlands; how beautifully they are engraved! Seal-making is, alas! to-day a lost art. We have only crude and heavy attempts. The company seal seems to-day the only thing the engraver can turn out—those machines which emboss upon a big red wafer.' And his busy fingers were continuously feeling the great circular bronze matrix, and a moment afterwards its sulphur-cast.

He was an enthusiastic antiquary, and long ago, in the days when the world was light, had read papers before the Society of Antiquaries at Burlington House upon medieval seals and upon the early Latin codices. Nowadays, however, Gabrielle acted as his eyes; and so devoted was she to her father that she took a keen interest in his dry-as-dust hobbies, so that after his long tuition she could decipher and read a twelfth-century Latin manuscript, on its scrap of yellow, crinkled parchment, and with all its puzzling abbreviations, almost as well as any professor of palæography at the universities, while inscriptions upon Gothic seals were to her as plain as a paragraph in a newspaper. More than once, white-haired, spectacled professors who came to Glencardine as her father's guests were amazed at her intelligent conversation upon points which were quite abstruse. Indeed, she had no idea of the remarkable extent of her own antiquarian knowledge, all of it gathered from the talented man whose affliction had kept her so close at his side.

For quite an hour her father fingered the three seal-impressions, discussing them with her in the language of a savant. She herself examined them minutely and expressed opinions. Now and then she glanced apprehensively to that open window. He pointed out to her where she was wrong in her estimate of the design of the circular one, explaining a technical and little-known detail concerning the seals of the Carmelite order.

From the window a cool breath of the night-wind came in, fanning the curtains and carrying with it the sweet scent of the flowers without.

'How refreshing!' exclaimed the old man, drawing in a deep breath. 'The night is very close, Gabrielle dear. I fear we shall have thunder.'

'There was lightning only a moment ago,' explained the girl. 'Shall I put the casts into your collection, dad?'

'Yes, dear. Moyes no doubt intends that I should keep them.'

Gabrielle rose, and, passing across to a large cabinet with many shallow drawers, she opened one, displaying a tray full of casts of seals, each neatly arranged, with its inscription and translation placed beneath, all in her own clear handwriting.

Some of the drawers contained the matrices as well as the casts; but as matrices of medieval seals are rarities, and seldom found anywhere save in the chief public museums, it is no wonder that the bulk of private collections consist of impressions.

Presently, at the Baronet's suggestion, she closed and locked the cabinet, and then took up a bundle of business documents, which she commenced to sort out and arrange.

She acted as her father's private secretary, and therefore knew much of his affairs. But many things were to her a complete mystery, be it said. Though devoted to her father, she nevertheless sometimes became filled with a vague suspicion that the source of his great income was not altogether an open and honest one. The papers and letters she read to him often contained veiled information which sorely puzzled her, and which caused her many hours of wonder and reflection. Her father lived alone, with only her as companion. Her stepmother, a young, good-looking, and giddy woman, never dreamed the truth.

What would she do, how would she act, Gabrielle wondered, if ever she gained sight of some of those private papers kept locked in the cavity beyond the black steel door concealed by the false bookcase at the farther end of the fine old, restful room?

The papers she handled had been taken from the safe by Sir Henry himself. And they contained a man's secret.

(To be continued.)

THE PROGRESS OF REFRIGERATION.

THE CONGRESS AND A RETROSPECT.

By J. RAYMOND.

IF an international assembly can set a hall-mark on an industry, the first International Congress of the Refrigerating Industries recently held in Paris should not fail to register the world-wide importance of commercial refrigeration, for forty odd states in both hemispheres and in torrid and temperate zones have, by sending their representatives, recognised mechanical refrigeration as a factor of their industrial life.

It was, perhaps, fitting that the premier congress should have been held in the French capital. London, of course, as the Metropolis of the world and of the country where refrigerating engineering has advanced to a higher stage than in France, might well have seen this gathering; but circumstances favoured Paris. The actual financial support of a Government and the personal patronage of its Ministers are best calculated to act as a good send-off to any international congress, and these were forthcoming from France; while Russia, a natural ally of that country, also lent financial assistance. The example set in these high quarters was well responded to by the trades of the various countries; the British Colonial Governments, with few exceptions, appointing official delegates and making grants in aid of the congress.

The passing of the congress has marked an epoch in mechanical refrigeration. The lessons learnt have been many. Several countries with good agricultural and pastoral prospects, hitherto not prominent in the great food-export industries, have learnt that an intelligent and enterprising application of refrigeration to the production and transport of their resources will put them beside the great producing nations of the world. Dealers in foodstuffs have found how without reproach they may prevent waste and conserve their profits by cold storage, while manufacturers of refrigerating plants have accordingly learnt through the congress of new fields for future enterprise.

The present aim of the writer is by a brief review, not of the congress itself but of the many directions in which refrigeration has been utilised, to show how permanent a force and vital a factor mechanical refrigeration has proved itself to be. Incidentally, of course, a study of all the papers submitted to the late congress—and their name is legion—gives a kaleidoscopic view of artificial cold, as it is called.

The spirit of commercially applied refrigeration is essentially versatile. Generated, paradoxically enough, in the first place by the burning of coals or the expenditure of other heat-energy, the cold produced by the refrigerating-machine is put to the most diverse uses. Hundreds of ships' holds are at the present moment being cooled to enable the hundreds of thousands of carcasses of dead meat to be safely brought to England from equatorial regions and beyond. It is not the fact that so much of Britain's meat-supply is given to her by refrigeration that strikes one so forcibly as the remarkable truth that it was hardly more than a brief twenty-five years ago—when electrical science had already grown out of its infancy—that a few enterprising engineers were struggling with a newly invented apparatus in the engine-room of a ship at an Australian port. The machine in question was a cold-air compression refrigerating-machine, and the vessel the *Strathleven*, the engineers being Messrs Bell & Coleman of Glasgow, a firm which did much to lay the foundations of our present-day cold-storage plant. The *Strathleven* was fitted with an insulated chamber of four thousand cubic feet capacity, and brought over to this country a pioneer cargo of colonial meat amounting to nearly forty tons, and consisting of about equal quantities of beef and mutton. The engineer who accompanied that early consignment on behalf of Messrs Bell & Coleman was Mr M. T. Brown, B.Sc., who is now honorary treasurer of the Cold Storage and Ice Association. Four years before this—that is, in 1879—the first cargo of chilled beef had been brought to this country from the United States on the Anchor Line steamer *Circassia*, cooled by a machine made by the same firm of refrigerating engineers.

I am not going to be drawn into a controversy as to the actual beginnings of refrigerative science. Various claims are put forward as to who were the first inventors of refrigerating appliances. Perkins, a patentee of 1834, takes a very early place, while half-a-dozen other names of prominent chemists and engineers of the last generation might be at once mentioned as being the pioneers of frigorific practice. In America the earliest record of the invention of an ice-making machine was in 1826, the patentees being two brothers of the name of Rodman, of Baltimore. In 1841 an engineer named Twining, of Hudson (Ohio), perfected the first compression-system refrigerating-machine. Some of the pioneers of refrigeration are still with us; and in Australia several of the earliest advances in the science were made, notably by the late James Harrison and the Hon. T. S. Mort. Mention of these and other names was not omitted at the recent congress, for the refrigerating industry is young enough to remember its heroes.

It was the early eighties which saw the dawn of the new era in the world's produce-trade. Argentina, which had been recognised as a promising

region for the investment of British capital, had in 1884 the first meat-freezing works established on the banks of the River Plate; the first company to kill, freeze, and export mutton from that republic being the River Plate Fresh Meat Company. To-day nearly a dozen companies are busily occupied in this work, and no less than 41 per cent. of the half-million tons of refrigerated meat that entered the United Kingdom last year came from South America. So important is Argentina regarded as a prospective supplier of chilled meat that the American Beef Trust has already bought one of its most favourably situated works, that of the La Plata Cold Storage Company, and it is said to have designs upon other establishments in that country. The Argentine contingent at the Paris congress was, naturally, an important one, and probably no country offered more loyal support to the movement, as many as a thousand members of the industry subscribing to its funds.

The refrigerating-engineer—that is to say, the supplier of refrigerating-machinery—claims to play the chief part in the successful maintenance of the overseas trade in chilled meat. The United States exporters, who send by far the greatest amount of chilled beef to this country, nearly a hundred and twenty thousand tons being last year's total consignments, manage in the short journey of under twenty days (total reckoning) to keep their meat safely at merely a chilling temperature—that is, with a soft surface. It is only with extreme care over the longer journey of nearly thirty days from the River Plate that this can be achieved, and its importance as regards market value is of the greatest. It is entirely due to high-class refrigerating-machinery, which maintains the temperature of the cold-storage holds at an even chilling level with great precision, that the River Plate is able to get beat prices for her chilled mutton.

To speak of the refrigerated dairy produce industry, which was referred to at the congress in a number of papers, is to mention another trade reckoned in millions sterling. The imports of refrigerated dairy produce into Great Britain in the year ending 30th June 1908 amounted to nearly seventy thousand tons of butter and close on one hundred thousand tons of cheese. Six countries, Australia, Canada, New Zealand, Argentina, Russia, and the United States, are engaged in this great industry, and refrigeration maintains the whole of the trade. An example of the money-value of cold-storage to an industry is afforded by Canada, which in 1880, before the introduction of refrigeration, exported eighteen million five hundred thousand pounds of butter at a value of only about six hundred thousand pounds; while in 1890, the export having fallen to one million nine hundred and fifty thousand pounds owing to greater local consumption, the sum realised for this much smaller quantity was seventy thousand pounds sterling. In 1906 the total Canadian butter-export was thirty-four million pounds, valued at nearly one and a half millions sterling.

The frozen-rabbit export industry which has sprung up in Australasia is one of the most striking instances of refrigeration actually creating a trade. In this case mechanical refrigeration has achieved something more—it has turned a pest into a big source of revenue. The annual export of frozen bunnies from Australia last year was eight hundred and forty-three thousand four hundred and sixty-three crates (twenty-four rabbits in a crate), and from New Zealand ninety-seven thousand three hundred and twenty-three crates. Victoria alone has during the last five years shipped nearly forty-one and a half million rabbits.

Tasmania, the smallest of the Australian states, has so far been the only one to specialise in fruit-growing, sending the mother country half a million cases of fruit last season, every case of which was carried at a low temperature on board ship by means of refrigerating machinery. The fruit is not frozen, however, a temperature of about three degrees Fahrenheit above freezing-point being maintained. Cape Colony is becoming famous as a plain and fancy fruit-exporter, the refrigerated holds of vessels having brought during the past season one hundred and seventy-two thousand cases of different kinds, from the comparatively hardy apple to the delicate nectarine and grape, or twice as much as any previous season's consignments. Covent Garden has already seen Victorian and South Australian apples and pears, and the Colonial Courts at the Franco-British Exhibition recently exhibited these fruits to the public. Before many seasons are past, Canada and the United States, the great apple-producers, will probably have to face the competition of Australia in the European fruit-market. Cape fruit, of course, has a season all to itself—the early months of the year, when there is little or no fruit in the English markets, proving a good opportunity for the Cape produce, thanks to refrigeration.

It would take much space to deal fully with all the other food-industries which artificial cold assists. Canadian and even Australasian poultry is enabled to compete with home stock and that from the continent of Europe. Fish, the most perishable of food, is preserved, and the modern steam-trawler equipped with refrigerating machinery is able to venture out to the distant fishing-grounds, a thousand miles and more away, to tap new sources of fish-wealth, and to bring home huge catches in perfectly fresh condition. The rest of the long line of food-producers who now lean on refrigeration are the biscuit-maker, the sweetmeat manufacturer, the dairyman, the sugar-refiner, the bacon-curer, the cheese-curer, the brewer, and the aerated water manufacturer—all have learnt to rely on its assistance.

But the food industries are only a few of those to which refrigeration is applied. The seasons of flower-bulbs, roots, and plants are altered to the

fancy of the horticulturist; chronometers are timed in a machine-controlled temperature; cigars are stored in cool chambers; wines are condensed and stored under refrigeration's care; iron-smelting is carried on more economically in furnaces whose air is dried over refrigerating coils; hops are kept with their full aroma from year to year; explosives are made and kept integrate in cold storage; candles, oils, and stearine are manufactured more efficiently with refrigeration; margarine-works are equipped with cooling machinery; photographic processes are facilitated by it; even mines are sunk in flooded soil by aid of mechanical freezing; and furs and textiles are kept where neither moth nor rust doth corrupt—in a cold store.

Cold-storage will become universal in its applicability to food industries when means are perfected for employing it constantly from the moment of the preparation of produce to the time of consumption. At present, although the harmful effects of preservatives are well known, it must be admitted that their application is easier, and in some cases, for this reason, more effective. The tendency of intelligent legislation, however, is more and more to curtail the use of preservatives in food preparation, and when the time comes for their supersession refrigeration will doubtless have been practically applied to every stage of the handling of perishable products.

As to the results which may be expected from the Paris congress, great importance must be attached to the permanent international commission, which, it has been decided, shall foster refrigerating interests, both commercial and scientific. If the example previously set by several educational centres, and the urgency claimed for the subject at the congress, be any indication, refrigerating engineering instruction will soon be included in many more college curricula. This, however, is but a small portion of the seed sown; and Vienna in 1910, and either Chicago or New York in 1913, will see refrigerating congresses dealing with a greatly advanced industry.

THE INVISIBLE MARQUIS OF GALLANTREVE.

CHAPTER II.

IT was now the most charming period of the year, and Josslyn's farm would be looking its best. The omens all seemed propitious. The schools were closing for the summer vacation. Maurice would not need to set foot on the hard pavements of Paris before the autumn, and he would work with Josslyn on the farm until the date arrived when he must return. So, putting in his pocket the remnants of the money his dead mother had intended for his use, he set out on foot for this old homestead, determined to waste no part of his store on railway fare, but to save his sous for food, or perhaps for a night's lodging when he could not find an unguarded barn to sleep in.

The journey consumed four days, and it was dusk on the fourth evening when he stood, tired and dusty, a veritable tramp in appearance, struck to a standstill with admiration of the beauties that graced the sculptured gatehouse which gave entrance to the château grounds. Education had broadened him in other directions than that of law, and this ornate specimen of medieval architecture, which had been so familiar to him as a boy that it seemed quite in the usual order of things, now appealed to the enlightened eyes of the man as a monument of which France had reason to be proud.

He gave the name of Maurice Armelin, and desired to see Monsieur Maillot, if that gentleman would excuse the untimeliness of the hour. If not, he would be glad to return next day at any time Monsieur Maillot would appoint. The ironmaster, who had been a workman himself in his day, received all sorts and conditions of men with less inquiry than the former owners of the château would have used. Until recently the name Armelin had belonged to a good family in the adjoining parish, and the young man's language being much superior to his appearance, he was admitted, and his message carried to the master of the house. Within ten minutes he found himself in the library of the mansion, standing before a hard-faced old man who sat in an arm-chair, with a flask of after-dinner brandy at his elbow.

'You say your name is Armelin,' began the old man harshly. 'Do you belong to the Armelins of Montivilliers?'

'I am a distant connection, sir.'

'H-m, a very good family, I am told. I understood they were extinct. Well, sir, what is your business with me?'

'I am a law student in Paris, sir. There have come quite legitimately into my possession certain documents which it is very necessary you should possess, as if they fell into the custody of the former owners of this property you would run the peril of an action at law which might prove your title invalid.'

'Ah! Are you a stranger in this neighbourhood, sir?'

'I belong to Paris.'

'Did you bring the documents with you, or are they in Paris?'

'I brought with me, sir, only a letter from the legal adviser to the late Marquis of Gallantreve. It gives his opinion regarding the outcome of such an action as I have referred to.'

'Show me the letter.'

Maurice handed it to him, and Monsieur Maillot scrutinised it carefully.

'Am I right in surmising that you offer these documents for sale?'

'Yes, sir.'

'Very well, if you beg of me to take this subject under consideration I shall give you an answer.'

'Beg of you, sir! You must not judge from my appearance that I have come to beg. You are a business man, and I am here to propose to you a business transaction.'

'You are probably aware that I am very wealthy. A wealthy man transacts business under whatever conditions he is pleased to impose. The needy man must accept those conditions, or go elsewhere. I have given you your choice. If you humbly beg of me to entertain your proposal I shall do so; not otherwise.'

Maurice Armelin blushed like a girl and kept silence for a few moments; then he spoke respectfully and quietly, as he had done from the first. 'Sir, you are in the right. The needy man must cringe if he is asked to do so. I humbly beg of you, sir, to entertain, and if possible accept, the very reasonable offer I am prepared to make.'

The stout Monsieur Maillot was breathing with increased heaviness. His hand trembled as he conveyed a liqueur-glass of brandy to his lips. 'What is your price?' he asked thickly.

The young man, taken unawares, answered impulsively, 'The title-deeds of Josslyn's farm.'

'If you are a stranger here,' cried the old man, his voice vibrating with anger, 'what do you know of Josslyn and his farm?'

The face of Maurice paled, and he found no words with which to reply.

Monsieur Maillot rose to his feet, trembling with ill-suppressed rage. 'You blackmailing scum of a profligate race, do you think to deceive me? I swore I would make the Gallantreves beg at my door, and I have done it; and now, Henry Francet, eleventh Marquis of Gallantreve, I'll show you how I treat one of your name.'

He smote a bell on the table, and a footman noiselessly entered the room. 'Bring two or three of the scullions and stablemen, and throw this whining beggar from the door. Give him one minute to reach the gatehouse, and then let loose the dogs.'

The footman bowed, and departed on his belligerent mission.

Armelin laughed.

'Has it not occurred to you, sir, how easily I could strangle you before your scullions come?'

The old man made a motion towards the bell, but Maurice deftly whisked it from the table. Monsieur Maillot, who in his anger had overlooked his own danger, moved craftily towards the door, and Armelin laughed again as he saw a cunning expression come into his face. He made a rather panic-stricken dash at the last, got outside, and locked the young man in.

'Good!' said the Marquis to himself. He walked directly to the farther end of the library, seized the middle compartment of bookshelves, gave two or three stout jerks, and the section came rustily away, disclosing a narrow stone stairway. Next instant the room was empty and the column of books back in their place again. Maurice chuckled as he descended into the ample cellar and struck a match, shoving back into its place a section of the bin which contained bottles instead of books, and effectually concealed the entrance to the secret stair.

'Now for the underground route to the boathouse, and then the river-path to Josslyn's farm.'

Achieving at last the interior of the boathouse, he found himself a prisoner. The stout door was stoutly padlocked on the outside. Again he laughed joyously. Everything seemed a joke this enchanted night. The rebuff he had received, the insults levelled at him, mattered not the snap of a finger. He was a boy again; his foot was on his native heath, and some mysterious, exultant virtue from the soil permeated the being of this son of the soil. Imprisoned? Not likely.

The boathouse was no longer the dilapidated semi-ruin it had been in his day. In the murk on either side he saw the shadowy forms of long and elegant boats slung by ropes above and broad canvas bands beneath, and suspected that there existed the newest of tackle for hoisting them from the water. Heavy doors closed the entrance from the river, but underneath them glittered a silver band of water where the young western moon struck the boathouse doors. He stood on a platform, and heard underneath it the gentle lapping of water along the edges of the deep bay into which the boats could be lowered, its surface invisible in the darkness. Impetuously he threw off his dust-laden clothes, and plunged, shoulder foremost, into the dark gulf, diving under the doors and out into the open, coming up shaking his head like a shaggy water-dog. Here the little river was both broad and deep, because of the dam half a mile lower down, where the crumbling water-mill was still not too old to grind corn, and from this spot, up through the quiet air, came the sweet ripple of the living water over the rocks and the subdued roar of the fall by the mill-wheel. Oh, but this was glorious! All the dust of the highway, all the weariness of the road, vanished in the cool, crystal embrace of his own river.

'Oh, dear river Rille!' he cried, like a young lover burying his face in her bosom, 'the world cannot hurt while you clasp me to yourself. Ah, little unsophisticated Rille, how often have I yearned for you when I stood beside that flaunting, unclean drab, the Seine!'

He struck sturdily out, and made for the old mill, half a mile there and half a mile back, then clambered on to the grassy bank, and stood a gleaming marble statue of Apollo, clothed only in moonbeams. He looked across towards the ancient château on the heights, its hundred turrets silhouetted against the star-sprinkled sky, the faint moonlight on its

gray stones making a mystery of every nook and cranny of its irregular surface. It was an enchanting picture that should have filled the beholder with romance and reverence; but this young fellow, who seemed to have washed away all care as if he had bathed in the sacred rivers of Damascus, no clearer nor more beautiful than his own Rille, placed hands on his naked hips and bent himself with laughter, for window after window of the château flashed into light and darkened again. In tower and in turret, in the long galleries and in rooms upstairs and down, lights appeared and vanished. They were hurriedly searching for the fugitive, and the ample building had cut out their work for them. Then there occurred to him the ironmaster's threat of letting loose the dogs, and he remembered that some person in ancient times, in similar classic guise to himself, had been torn by hounds; so he resolved suddenly to depart. They might at any moment send out another search-party through the grounds, and in that case he would be safer at the distant Josslyn farm. Luck stood his friend in that he found the big padlock of the boathouse door unlocked. He entered, dressed himself hurriedly, left the door precisely as he found it—for he was anxious to leave no trace that would elucidate the mystery of his escape—and so strode down the path by the river towards Josslyn's farm, three miles away. Although weariness had departed, hunger had increased, and he recollected that in times gone by the Rille had played that same trick upon him, making him hungry as one of the greedy trout that swam in competition with him. There was no pursuit, so far as he could gather, and no baying of hounds to the rear of him. Indeed, the château, with its innumerable rooms, offered opportunities for search which might well occupy the investigators till broad daylight beamed in at the eastern windows.

The farm of Josslyn was, in its humble way, no less attractive than the château itself. It too was decorated with conical-capped turrets, and it was built like a fortress round a great courtyard, whose heavy gates, when shut at night, closed the inmates from all the rest of the world as snugly as nuns in a convent. The thick walls had in their time withstood more than one siege, and could again if the necessity arose. 'Early to bed' was the motto of this thrifty homestead, and the place was silent as a deserted town when the young master of Gallantreve approached it, coming up through the forest from the river.

'Ho, Josslyn! Ho, Josslyn!' sang out Maurice lustily. 'Wake up, thou sleepyhead! Why dost thou slumber when a weary traveller begs shelter and food at thy gates? Rouse thée, Josslyn! Ho, Josslyn! Ho, Josslyn!'

And now came the sound of dogs. Half-a-dozen savage cries from the interior of the courtyard made the night air vibrate; but the young man knew that, if he could not get in to them, they could not get out to him.

'Ho, Josslyn!' he cried. 'Ho, Josslyn! Wake up, thou seventh sleeper! Eighth, ninth, tenth, thou art, rolled into one! Rouse thee, sluggard! Ho, Josslyn! Ho, Josslyn!'

A window was raised, and out into the moonlight came the nightcapped head of Josslyn, but he held a blunderbuss in his hand. 'What now, marauder, disturber of honest men! Get thee gone, or I'll put a score of slugs in thee!'

'Thou wilt shoot me, Josslyn? Braggart! Well I know thou couldst not hit the château at a hundred yards! Thou wilt fill me with slugs? Not so, Josslyn. Thou shalt fill me instead with one of those inestimable omelettes which thy worthy spouse maketh. And why does the adorable Marie Angelique, princess of cooks, keep silence while her dullard of a husband threatens his former overlord and labourer?'

A joyful cry made itself heard over the deeper bayings of the dogs.

'*Mon dieu! Mon dieu!*' vociferated the unseen. 'It is the young master, and none else! Fling away the foolish gun, numskull! Down with you at once, and open the gate.—Henri! Monsieur Henri!' cried she, appearing for a moment at the open window. 'Is it indeed thyself?'

'Oh Marie Angelique, not Juliet on her balcony was more welcome and beautiful than thou at thy window! Marie Angelique, I am famishing. Are there any eggs in the house?'

'Yes, in scores, Henri, and thou shalt have an omelette as soon as the twigs are alight, and meanwhile plump cold *poulet* and *salade*, white bread and golden butter, with the best of wine from the cellar. Get thee round to the front; the dogs have ceased, and Josslyn has opened the gates. I see thou hast not come to us by the highway, but along thine old lovers' walk by the river.'

'True, Marie Angelique, thou blessed one, the better to serenade thee with the cry of a hungry man, a plaint thou didst never yet ignore, kind-hearted Marie Angelique.'

Marie Angelique disappeared, suddenly recollecting that she was in deshabille. The young man strolled round the enclosure, and found the small door open that was part of the huge medieval gate, bolt-studded and strong. Josslyn, a greatcoat on his shoulders, stood at the entrance harshly warning back the dogs, who were eager for combat, but who quickly knew that this was a valued friend, and sniffed round him when he entered, giving little yelps of approval.

'Monsieur le Marquis de Gallantreve,' said the old peasant solemnly, bowing profoundly, with hand on heart, 'you are welcome to this house.'

Monsieur le Marquis laughed joyously, and smote the elder lovingly on the shoulder.

'Welcome, indeed, Josslyn! Ay, a welcome at the mouth of a blunderbuss.'

'My eyesight is dimmer than when I saw thee last, and the moonlight was in my face and on thy back. Then thou art grown, Henri—grown out of

all recognition. Thou art a larger man than thy father was.'

The small door in the big gate having been fastened, the two, surrounded by the cavorting dogs, made across the stone-flagged courtyard to the main house, from whose windows a ruddy light now shone, betokening the blaze on the ample hearth that the young Marquis knew so well. There was no formality in Marie Angelique's greeting, and no mention of titles save those of affection. She flung her arms around his neck and kissed him, as she had kissed him when he was a baby. She wept a little, remembering former grandeur when she was a servant in the great house, and now the last representative of it tramped the roads and was hungry.

'By all the saints, Marie Angelique! it is good to know that at least one hearthstone on this earth of strangers brightens up at my approach. I have often been lonesome for you, Marie Angelique. No other woman has usurped the place you've held in my heart since I could walk. Talk of the beauties of Paris! There is no woman in all that great city to compare with thee, Marie Angelique!'

Maurice tried to speak jocularly, but his voice trembled and his eyes were moist. No one had given him welcome in all the years that intervened between that night and the day when, a lad, he had left the Josslyn farm.

'Sit thee down, sit thee down, Henri. Ah, some day the flattery will please a beautiful young girl, but not so much as it pleases a rugged old woman. How thou art grown! La, la! the years do pass, improving thee, and pushing Josslyn and me down the hill. And now to the chicken and salad, Henri. The omelette will be done when thou art ready for it.—Josslyn, the wine from the locked bin. Here is the key.'

The old man descended to the cellar, and brought up a bottle as dusty as his visitor, and older. Josslyn sat silent for the most part, gazing at his guest. Marie Angelique talked and talked, plying the young man with good things to eat, filling his glass before ever it became empty.

'Oh!' said the young man, 'I have never done anything to deserve this. It is a pleasant world after all!'

The Marquis of Gallantreve slept well that night in the best bedroom of the farmhouse. The next day he lounged lazily about the place, resting from his long walk, loafing under the trees, and dreaming by the side of the river. He saw that he would need to change his plan of spending the summer here. The ironmaster had regarded his attempt at settlement merely as an effort at blackmail; and, as the Josslyn farm was mentioned, inquiry would doubtless be made, and his presence could not be concealed. So bitter was Monsieur Maillot's hatred of the name Gallantreve that the ironmaster was likely to do something drastic if he learned his whereabouts, and an arrest for blackmail, at the instance of so important and wealthy a personage as Gastyn Maillot, might not only prove serious in the present, but would also tend to prejudice an action at law in the future, making it seem like a motion for revenge.

To his host he said nothing of his visit to the château, but cautioned him not to speak of his excursion into the district of his birth. Josslyn worked hard in the fields, grumbling a good deal because the ironmaker, as he called him, had raised his rent, and for two years he had been paying more than he considered just. Marie Angelique was desolated, as she said, because Maurice insisted on returning to Paris. That shrewd and kindly woman talked volubly to him about his prospects, and made many inquiries regarding his mode of life in the great city, finally worming from him the full particulars of his financial situation. Doubtless she would have learned of his visit to the château and his treatment there had she not been perfectly confident that the trip was taken solely for the purpose of seeing herself and Josslyn's farm.

When Maurice Armelin returned to Paris, this time by train, he carried with him five thousand francs that these frugal people insisted on lending to him, and thus not only was the question of his education settled, but he had money in hand after his admission to the Bar to tide over some period of his waiting until professional returns began to come in.

All in all, it was nearly three years after this visit to Josslyn's farm that he was in a position to begin his great action at law. He was enabled to do this by getting into communication with the successors of the family solicitor who had been his own guardian, and who for so many years held in his hands the declining fortunes of the House of Gallantreve. They were amazed to learn that the Marquis of Gallantreve, supposed to be sojourning in Italy, had placed so important a case in the hands of a young, inexperienced, and unknown man, and were inclined at first to take offence that the Marquis had not communicated direct with them; but Maurice Armelin explained that he was by way of being a relative of the Marquis, and they knew that the Gallantreve and Armelin families had intermarried; so, when the diplomatic young man added that it was by the Marquis's own instructions he had communicated with them, they agreed not only to lend their legal assistance in bringing forward the case, but to venture financial aid as well. They studied carefully the letter of their predecessor which Armelin had shown to Gastyn Maillot, and also the well-thought-out documents containing his plans for the presentation and fighting of the case. He wrote that such an action would probably be decided in the defendant's favour in the lower court, but that the plaintiff would win before the judges on appeal. The final verdict would turn upon a point of law—a matter, strictly speaking, for the judge's decision; and the old man advised that the best lawyer obtainable, as distinct from the best orator, should present the case to the

judge, and call for a decision, using his utmost efforts to prevent an appeal to the jury, as a jury was apt to favour the man in possession, and in this case, where one of the people, although a millionaire, was defendant, there was a chance that prejudice might prevent strict justice being meted out to an aristocrat. The plaintiff could win in the lower court only through the judge's decision, which would prevent his case coming before the jury. If, in spite of all, the jury were asked to decide, then the most eloquent speaker of the Paris Bar should be secured, and this man should keep the aristocracy of the plaintiff as much as possible in the background. The old man pinned his faith, however, to the Court of Appeal, where good law was to be expected, and no taint of prejudice. Nevertheless, let the utmost be done in the first court as well. Sometimes astonishing things happened in law.

(To be continued.)

MONTE CARLO EXPERIENCES.

By J. M.

THOSE people who have doubts that 'truth is stranger than fiction' should try Monte Carlo. There they will find plenty of material to confirm the old adage. That, at least, has been my experience.

Going for a day to do the Casino, I remained six weeks, and even then the human interest in the place was unexhausted. The beautiful setting of this favoured spot charmed me; the mountains, the rocks, the ever-blue sea, grim old Monaco, with the Italian shore in the distance, all conduce to give it an air of distinction and romance. The colour and movement of the cosmopolitan, well-dressed crowds, the fine orchestra, the beautiful pigeons, afternoon tea in the Café de Paris, the music in the moonlight, the palatial Casino (with its daily supply of newspapers from all parts of the world free to visitors), are all attractions for the tourist, the student, and the man of the world.

To the student of human nature the greatest attraction of all is the stream of humanity constantly surrounding the gaming-tables. Here they come and go all day long; certain faces appearing regularly at 10 A.M., when play begins, while others are seen trying their luck to the last moment of closing-time, 11.30 P.M. No matter what time you choose, you find play briskly going on, and during the height of the season it is often impossible to get near enough to see clearly what is taking place.

Where do the players come from, and what are they? Why do they play, and then what after? To answer these queries requires an intimate acquaintance with the gaming-rooms and their habitués. Everybody becomes so democratic here! You may sit beside a Grand Duke or a millionaire, while your *vis-à-vis* may be a Parisian actress or a London shopkeeper. All sorts and conditions are represented, from inoffensive schoolmasters on holiday to *blasé* plutocrats and professional gamblers. Many look in to see the crowd and 'how it is done,' and do not play; but most who enter try their hand with roulette, the minimum stake for which is five francs.

When players are tired they adjourn to the beautiful tea-room, or lounge on one of the luxurious sofas with which the hall and saloons are studded. Here one may hear curious snatches of conversation in many tongues, and observe the development of petty intrigues.

I was sitting one morning in a quiet corner, when two elderly men sat down beside me. One was evidently a Scotchman, and the other, I gathered, was from Yorkshire. The former remarked, 'I have just managed it.' This, I discovered, meant a win of twenty francs. Their daily routine was to appear at the same roulette-table at an early hour, and play the lowest stake of five francs on even chances—that is, on black or red, or on the odd or even numbers. They would lose and win, and win and lose; but they remained calm and self-contained, and persevered until they had each twenty francs to the good. I observed them daily; some mornings they scooped in the amount in twenty minutes, and at other times it was a tough struggle until lunch-time before they managed it. I never saw them fail once, and I learned that they had pursued the same plan for four months. One thing was clear: nothing could tempt them to go beyond the modest stake, and they had the will to stop when they won the stipulated amount. It was really one of the best illustrations of will-power I have ever seen; for few indeed who enter the portals of the Casino are able to resist the compelling atmosphere of the tables to play on if losing and to plunge if winning.

When these two old philosophers were not at play they might be seen in the reading-room, in the gardens, or sitting in the lounges discussing problems of all kinds with other visitors. One day I heard the Casino and gambling discussed from all points of view, and a more exhaustive, fair, and candid consideration of a subject I have seldom listened to. This to happen within the walls of the Casino was a curious experience. Another day the subject was vegetarianism, and it was really laughable to listen to a heated discussion of the 'simple life' in what many people consider the wickedest place on earth, where everything is on a scale of unstinted luxury and extravagance, and money is scattered about in handfuls.

I had always pictured Monte Carlo as a centre of

debauchery and villainy; but I found the frequenters for the most part were quite ordinary people, and there was really less appearance of vice and disorderliness than could be seen in any city of the world. There is certainly a considerable sprinkling of high-class criminals hovering around, but these are closely watched by a large force of secret police.

Every visitor must fill up a paper in his hotel or *pension* giving particulars as to identity, and after ten days a permit must be applied for at a cost of half-a-franc. I omitted to go through this formality, and one morning received a visit from an armed policeman with a summons to attend court at Monaco for residing in the principality without permission. During the season many British and American visitors are fined for this omission; but, if civil to the officials, they get off cheaply. A passport is important here, especially in seeking entrance to the Casino and at the post-office.

The keenest players spoke very little, and were mostly sad-faced men and women. Even the usually animated Italian and Frenchman sat silent and serious. In fact, the loudest people were some Englishmen, who, having dined not too wisely, shouted to the croupiers at the top of their voices in English; it was plain the patience of the officials was sorely tried, and one could not but admire their courtesy, tact, and firmness in trying circumstances. One of these young Englishmen came in late one evening, and was almost incapable, but his play and his luck were something extraordinary. He spread handfuls of twenty-franc coins all over the table, and his winnings were piled up before him until it was a case of *embarras des richesses*. His tongue rattled on all the time, and at last an official expostulated, when he retired in high dudgeon, muttering something about fair-play and his good money.

A curious study was an Englishman of about seventy, who was always one of the first to enter the *salon* to secure a favourite seat at a favourite table. In appearance he reminded me of Lord Roberts; he was grim and concentrated, and only spoke in undertones to the nearest croupier. There he was to be seen sitting every day until one o'clock, Sundays included, his eyes never off the wheel or the table. Before him lay an old-fashioned wallet well filled with gold, and in a loose heap a supply of five-franc pieces. Sometimes he would sit for hours without undoing his purse-strings or venturing a single piece; at other times he seemed to find his game or think his luck had come, and he would play deliberately, like an old chess-player. Of hundreds I observed, I think he was the most successful and steadiest gambler in the Casino during my time. I noticed he waited about twenty spins of the wheel before venturing, and if he lost three times he stopped for a considerable interval, resuming if certain numbers appeared. He seldom played on the even chances, but generally on favourite combinations of numbers, especially the second dozen—13 to 24. Of single numbers, 7 was his favourite, and one morning it turned up twice in succession, when he scooped in one hundred and seventy-five francs each time. At the same sitting he put large stakes on the second dozen, and in a short time made five thousand francs. Many players carry and consult elaborate note-books containing average sequences of numbers; but this man carried everything in his head. He was a professional gambler, and spent his time between Monte Carlo, Nice, and Ostend. He seemed very lonely, and to have no friends.

There were many terribly reckless players. A Russian nobleman, an Italian Count, a wealthy American, an aristocratic French lady, and another mysterious Britisher were among those who made things hum. Each had a system which they backed daily with thousands of pounds, only to see their money shovelled away by the inexorable croupiers. After some of these had lost heavily, evidently all they could risk, they gave one the impression that they had finished some important necessary task, and looked on at the game in a wistful, melancholy way. I heard one of them borrow twenty francs to pay for his lunch, though only the day before he started with a pocketful of thousand-franc notes.

A pretty Parisian actress attracted my attention; she had come for a month, and was evidently well known to the officials, and a favourite. She also had her favourite table. Day after day she lost at roulette, so she changed to another table, when good fortune came to her. Seated with a wooden disc before her, with 17 carved on it, she played a varied, complicated system, and in three days she won back all her losses and two hundred and fifty pounds to the good; and, wise woman, she smilingly bade adieu to her acquaintances, giving a good douceur to some of the croupiers. These men are above suspicion, and, besides, they are changed every half-hour; but some players give little presents to officials, who are often helpful to new-comers, the short-sighted, and the absent-minded.

One day a commotion was caused, and all rushed to the table I happened to be sitting at. A stout, military-looking German stood with great bundles of large notes in both hands, and at every turn of the wheel he played the maximum stakes on the even chances. Eight times black came up, and eight times he won; and when he changed to red so did the wheel. This man must have won many thousands of pounds that day, but he never appeared again.

Very different was another plunger, who, carrying all before him during his first week, continued his reckless course until I saw him latterly playing with the minimum five francs. Like others, he took it as a matter of course, and so long as he had money could not resist the temptation to try fickle fortune.

Frau X. was an attractive Austrian lady, whose husband left her at Nice a year before with the promise to return and take her and the children home. But he never came. He lost a fortune at

Monte Carlo, and, his affairs getting into serious confusion, he absconded. So the wife and children removed to the vicinity of Monte Carlo, and each month when the remittance came bills were paid and the balance used for gambling. The excitement was part of her life, and a sort of consolation she said she could not resist. Sometimes she made a tidy sum, with which the family had a tour or a visit to Paris; but oftener it was a case of waiting in penurious anxiety for the next remittance.

One day while I was at lunch the waiter brought me the card of a stranger who wished an interview. He was a young gentleman from Berlin who had got into sore trouble. His tourist-ticket was a circular one, taking him round half Europe, but he had only covered a quarter of the tour before getting 'stuck' in Monte Carlo. It was his first visit, and, winning a little at first, he lost his head and his money too. He then telegraphed for cash, and again he played and lost all. He next borrowed from a friend by letter, as he wished to conceal his doings, and when the next hundred pounds came he could not resist the temptation to try to repair his losses, so he spent another day alternately winning and losing, but by evening he had parted with his last franc. He now wished to sell his ticket and part of his luggage; but I counselled him to ask the Casino bureau to pay his expenses to an Italian town (which they did handsomely), and there await the help of his friends. There was no use getting more money sent here, I said. He took my advice. I fear that month's holiday was the least pleasant in his experience; but, as he remarked on departing, he had learned more of human nature there than was possible in any university.

A good-looking young lady, evidently of good family, appeared one morning. She was unaccompanied, and properly reserved, but feverishly watched the play. Then, in a shy and timorous way, she placed her silver piece on the cloth, and it won an equal amount. Again she tried, and won, and I saw her eyes grow big and her cheeks flush with nervous excitement. She certainly had luck that day, and she came again, this time with a supply of gold. Like others, she already imagined she knew how to do it, and had some rough idea of playing certain numbers as likely to follow others. But she was making no headway, and, as if in desperation, she pushed the heap of money in front of her, and emptied the contents of her purse on to red, and red won. What an expression of triumph came over her countenance! But she turned deadly pale, and with an effort reached the tranquillity of the tea-room. There she was followed by one or two old roués, who tried to attract her attention, but in vain. Next day she took her seat, looking confident and at ease. She got change for a thousand-franc note, and forthwith commenced to play high; but soon her stock of notes and gold was gone. She left the table hurriedly, but in half-an-hour returned with more money, with which she maintained a desperate three hours' play, when she gave in, looking vexed and exhausted. At this point one of the insinuating roués referred to offered her some gold, saying he would be glad to be of service to her, but she turned from him without replying; and a good thing for her, too. I observed him and his cronies following her out of the Casino to the railway station. I could not feel sorry when I learned that two of this gang were excluded from the Casino that very evening, the secret police having discovered they were old offenders, and wanted elsewhere.

Needless to say, gamblers are the most superstitious of people, and a very small sign indeed will often cause them to change their plans. You will see them examining the number of their cloak-room checks and begin their play with it, or it may be the number of their bedroom, the date of the month they were born in, or some chance-mention of a number that gives them the cue to start from. A story is told of Colonel Z., who had lost heavily, and, in fact, was waiting a remittance from London to meet his hotel-bill. He went to church on Sunday morning, and the number of the last hymn was 36, the words of which seemed to haunt him. Sauntering aimlessly into the Casino, the first thing he heard was 36 shouted by a croupier at the first table; and, taking that as a good omen, he put down his last five-franc piece, which he kept for luck; again 36 turned up, and he won one hundred and seventy-five francs, and before he left he had made enough to pay his bill ten times over.

A young Frenchman confided to me that 32 was his lucky number, and said that he would show me how he played. Well, it so happened that although he backed his favourite forty times in succession it did not turn up, and when it did come at the forty-first turn of the wheel and won he was out of pocket. But now he quadrupled his stake, and his number coming out on the third, seventh, and tenth rounds, he made a large sum. His rule was to stop when he made five hundred francs at a sitting, and his wife, who carried the purse, got the winnings. They had a small business in a provincial town, and this was how they spent their monthly week-end holidays.

The week-enders are numerous, and come mostly from the northern Italian towns and the southern French provinces. They are generally of the smaller fry, who gamble and are content if they get an outing at the expense of the Casino. One old Frenchwoman of at least seventy came almost weekly, and it was pathetic to see her sit ruefully regarding her silver pieces as they rapidly disappeared. She only played zero and *quatre premier* (first four—0, 1, 2, 3), and although now and again she won, I fear each visit resulted in dead loss.

Some players alternate between roulette and *trente-et-quarante*, a card-game of pure chance; but the latter is never popular with new-comers, as the minimum stake is a twenty-franc piece,

and is not so interesting as the former, which furnishes ample scope for the subtle and imaginative gambler.

Some go to Monte Carlo hoping to make money, and among these are adventurers of all types from every country in the world; but the majority of players are there on pleasure bent; and, while winning adds zest to the game, they go prepared to lose their money, and they are generally successful in doing so. The atmosphere of the place is that of suppressed excitement, and the state of mind engendered creates a craving for fresh sensations. Many are like the Japanese gentleman I made friends with, who on his departure remarked, 'I need the rest-cure badly after my two months' play, and I am going to Germany for it.'

THE DERELICT.

By Captain H. MAGILL, F.R.G.S.

SILENT and unseen in the darkness of night lie these dread enemies of the seafarer, studding the ocean-tracks, and accountable for a long list of missing ships and people. It does not require a very powerful imagination to conceive the great danger these floating wrecks are to all kinds of vessels, and the horrible catastrophes collision with them may cause, especially to those large and swift passenger-ships literally loaded with human beings. While the majority of shipmasters engaged in the Atlantic service report all the derelicts and wreckage that they see to the Hydrographic Offices of the United States or Great Britain, and they are duly charted and otherwise advertised, still comparatively little is done to remove them by the Governments of either country, notwithstanding the vast commercial interests involved and the common humanity which should exist between us. Occasionally, when one of these derelicts is reported close to the American coast, a warship is despatched to destroy it, and (less often) this is also done on our own coasts; but those far out at sea are allowed to drift whither the winds and currents list, working havoc that may never come to light.

I have at different times and in divers ways advocated a more lively interest in the destruction of these death-dealing nomads of the watery waste. What better use could a warship be put to in time of peace than in destroying these dangers to life and property? The gunnery and torpedo practice would, I think, be more valuable than that gained in the usual way at targets and in smooth water. Also, there would be good opportunity for the study of winds and currents while searching for these wrecks from their last-reported position, and the study of meteorology and deep-sea sounding between times.

The majority of these unfortunate vessels are American schooners, constructed of timber and laden with the same material; others are European vessels of the same construction and lading. In the hurricanes of the summer months from July to October, and the severe gales prevailing along the American coast and in the Atlantic during the rest of the year, these vessels become waterlogged and unmanageable, but are kept afloat by the buoyant nature of their cargoes. If the crews are not washed overboard, or perish from starvation or exposure, they are usually rescued by a passing vessel, and their late home left to drift aimlessly, a monument to their misery and a menace to mankind. Merchant-vessels are not equipped with the means of blowing up these wrecks; and setting fire to them does little good, as the flames take little or no effect on the sodden planks.

Many interesting cases of these wrecks have come to my notice in the course of a long experience, a few of which I will relate in due course. To tell all would require too much space.

The track usually traversed by these derelicts is along the Gulf Stream, skirting the American coast from Florida Strait to Cape Hatteras, then trending north-eastward to the Banks of Newfoundland, impelled by the current and prevailing westerly winds. At the Banks the Arctic current is encountered; and this, with the north-westerly winds, carries these derelicts again into the influence of a 'spur' of the Gulf Stream setting to the south-east, and thus brings them into the region of the north-east trade-winds and to the equatorial current setting to the westward, and will in time bring them back to the vicinity from which they started their 'voyage to nowhere.' Others, from a long continuance of westerly winds and currents, drift across to the shores of Great Britain, France, Portugal, and Spain. The majority, I believe, make the circular tour, however; but when they enter the Sargasso Sea they are liable to be unheard of for long periods, owing to the stagnation and absence of traffic at this part of the ocean.

In the winter of 1891 the American schooner *Fannie E. Wolston* was abandoned near Cape Hatteras, and started on her drift along the Gulf Stream, describing the circle as above stated, and, according to Hydrographic Reports, crossing and recrossing her own track many times. This vessel was, I think, the most remarkable on record, having drifted about the ocean for about four years and covered over nine thousand miles. During the winter of 1898 I sighted her in the vicinity of Bermuda, and bore down on, examined, and set fire to her. An invalid friend who was with me was very much interested in her destruction, and kindled the blaze, and when last we saw her the

flames were playing merrily, and I was hopeful that she would be destroyed; but, alas! she outlasted my sick friend, who died a few weeks later, and the *Wolston* did not break up until two years after, on the New Jersey coast. I reported the firing of this derelict on my arrival at New Orleans, and learned from the Hydrographic Office that I had done so exactly two years from the time she was abandoned.

Another derelict, which by a strange chance I sighted twice in her wanderings, was the *Twenty-one Friends*, abandoned about twenty years ago near the American coast, where I first saw her, and to the best of my recollection I again saw her about a year later two hundred miles from the Irish coast.

I have before me a large number of records of the driftings of derelicts, a few of which I will mention in brief. The schooner *Alma Cummings* was adrift for a year and a half, and covered about five thousand miles. The crew, after suffering great privations for a week, had been rescued by the Liverpool steamer *Queensmore*. The *Hyaline* was abandoned in the early part of 1896, and in the course of seven months had drifted one thousand miles; she had been unsuccessfully fired some time previous to her last appearance. The barque *Florence E. Edgett*, during a hurricane in the Caribbean Sea in the fall of 1902, was dismasted and became a battered, helpless wreck; yet the captain, his wife, and crew remained on the wreck for nearly a month, hoping for succour. Eventually they were reduced to bread-and-water rations, and were obliged to take to their only remaining boat and make for Grenada, Windward Islands, a distance of over a thousand miles, which they reached after eleven days. Nothing was known of the ultimate fate of the hulk.

Another derelict, not a wooden one, which many on this side of the Atlantic will remember, was the steamship *Loch Maree*, abandoned about ten or twelve years ago some distance west of our coasts; and, although she presented grave danger to shipping while adrift, she eventually proved a rich prize to the man who towed her into Belfast Lough. This steamer had run short of fuel, and had been drifting about for some time when the crew left her, but was practically undamaged, and laden with a very valuable cargo. This class of derelict is very uncommon, however.

Some years ago an intimate friend of mine was forced to abandon his vessel much against his will. He had been making heroic efforts to bring her into port even in her waterlogged condition; but when a chance of being taken off by a passing vessel presented itself, the crew, who were exhausted by their pumping and other operations, refused to remain longer with him. Before leaving the ship he was anxious to save his pet cat, but pussy had become alarmed at the unusual commotion, and refused to be captured, and so succeeded her master in command of the ship. Some weeks later the *Charger* drifted ashore on the west coast of Ireland, and was boarded by the coastguard, who were met at the gangway by pussy in the manner usual with all polite commanders.

Another old friend of mine, long since dead, was forced to abandon his vessel, the *Norton*, in the Atlantic, she being full of water and the provisions all used up or destroyed by salt-water. The crew were taken on board of a sailing-vessel bound to Falmouth for orders, but delayed in getting there by adverse winds. The story is told of his pacing the poop, from force of habit, as if he were himself in command, while entering Falmouth. As he looked ahead his gaze became fixed, and then he put the telescope to his eye, and exclaimed in his rich Dublin brogue, 'Bedad, if I did not know that I left the ould *Norton* outside I'd say that was her at anchor.' And so it was. She had reached port before her captain and crew, having been towed in by a steamer; but she was condemned forthwith, I believe.

Many sad and weird tales are told of the lonely derelicts, and the death, disaster, and privations of their crews and victims, but few are the humorous tales. While our country and learned and scientific societies are ever ready to promote exploring and surveying expeditions, or anything else for the public good, surely a greater interest should be taken, especially by the Government, in the destruction of the derelict, as much the enemy of the passenger as of the seaman. I trust that this article may at least cause those who have the power to influence a move towards the prompt destruction of these dangers as soon as possible after they are reported. It is unlikely that it would materially increase the cost or expenditure of the British or United States navies to detail one or two vessels to police the ocean for this purpose. These ships could receive reports from passing vessels, and also by wireless telegraphy from and to their bases, thus keeping the path clear for the commerce which supports them.

PAST AND PRESENT.

Though all the Singers of old time
Sang in perfection long ago
The mast'ries of their varied rhyme,
Shall, therefore, we be silent? No!
The sun still shines, still falls the dew,
Then take your lute and touch the string.
The world to Youth is always new;
We still can laugh! we still can sing!

Though all the Lovers of old time
Loved in their glory long ago,
And left us memories sublime
Of passion and of glorious woe;
Yet now, as in the days of old,
We still can our devotion prove.
Let no man say our hearts are cold;
We still can weep! we still can love!

PART I.

JOHN RUSKIN, WILLIAM MORRIS, WILKIE COLLINS, ROBERT BROWNING, LORD TENNYSON, MATTHEW ARNOLD.

A RECENT purveyor of humour who earned considerable notoriety by his paradoxes and inverted maxims, and less fame for his genuine distinction as a man of letters, declared that memoirs were generally written by persons without any memories and about people who were not worth remembering. There can be little hesitation in affirming that 'Reminiscences' are, in the main, the pastimes of old age, and as such there must always be the danger of the figure-subjects of the retrospective survey being blurred by the mists of years. An old man's backward glance must of a necessity take in much that is nebulous, resulting in his observation showing a marked deviation from a normal and sane perspective. This fact may count as an apology, as it has served as a suggestion for a series of impressions which the present writer has been asked to record of a few notable figures, now deceased, with whom he was privileged to come into personal contact during the last two decades. He cannot claim one qualification for the task. He is unable to class himself legitimately as a contemporary, for the majority of those with whom he proposes to deal had already made their mark on the history of their time before the writer's sex had even been determined, and the rest before he had passed much beyond the 'hare and hounds' period of life. Frankly, then, these impressions are of those who counted by one who did not. If the writer can put forward a claim for hearing, it will be that he was, if anything, overgifted with that quality of hero-worship which must always be admirable to the man who cares more for appreciation than discriminate criticism. He was brought up to believe in a respect for authority, and even, it must be admitted, for mere names. Finally, however inadequate his recollections, yet he is able to plead that the space of time between the impression and the record is so short that the distinctness of the former is in each case sharp, and innocent of that nebulosity which seems to be the inevitable outcome of years. He admits one great handicap. Being the impressions of youth, they are naturally bald and unilluminative, inasmuch as they cannot claim that completeness which can only spring from the intelligent interrogation of a man capable of meeting his fellows with practised weapons on their own ground.

I was a mere boy when I was first privileged to stay in the same house with John Ruskin. The period of life was fortunate in one way, for susceptible youth is a disciple of enthusiasm, and Ruskin, like his master Carlyle, was first and foremost an enthusiast. As such he earned my adoration; but as a guide he seemed to me hopeless, for he usually answered one question by a disquisition on another. If, with the forgivable boldness of youth, I ventured to make some casual reference to art, he forthwith talked on morals; if I suggested ethics, he delivered a homily on political economy; if I touched on literature, he assailed me with eloquent periods on the evils of sport. But an absence of relevancy in speech seemed to me more than balanced by the inordinate richness, the eloquent freedom, and the unusual daring of his generalisations; and the fact that these were not quite usually to the point did not seem to matter much at the time. There was little compromise about him. Like Carlyle, he shot his friends and his enemies into moral and artistic pigeon-holes, and no argument would convince him of the unfairness of his method in any particular instance. He gave his dog a bad name and immediately proceeded to hang him. His method of instruction was excellently demonstrated on one memorable occasion. After my first interview with him, I was anxious to make a systematic study of his writings, and on his own invitation wrote

[*All Rights Reserved.*]

him a letter, not, I hope it will be believed, without great mental diffidence, for I had come to believe that he, again like Carlyle, had a desire to consign all young men under twenty-five to the cover of a glass case where he would grant them the privilege of being seen but certainly not heard. My first request was that Mr Ruskin might indicate to me some method by which I could approach the study of his writings; in other words, I was anxious to know if his contributions to literature were to be read in the systematic way in which one would attack the works, say, of Mr Herbert Spencer. Ruskin's reply was characteristic. There was no reference at all to the matter that specifically concerned me at the moment, not a single word relative to his own works and my admittedly ingenuous and quite sincere request. 'For a Scotsman, next to his Bible,' he wrote, 'there *is* but one book—his native land; but one language—his native tongue, the sweetest, richest, subtlest, most musical of all the living dialects of Europe. Study your Burns, Scott, and Carlyle—Scott in his Scottish novels only, and of these only the cheerful ones, with the *Heart of Midlothian*, but not the *Bride of Lammermoor*, nor *Legend of Montrose*, nor *Pirate*. Here is a right list: *Waverley, Guy Mannering, Antiquary, Rob Roy, Old Mortality, Monastery, Abbot, Red Gauntlet, Heart of Midlothian.* Get any of them you can in the old, large-print edition when you have a chance, and study every sentence in them. They are models of every virtue in their order of literature, and exhaustive codes of Christian wisdom and ethics. I have written this note with care; I should be glad if you sent a copy of it to any paper read generally by the students of the University of Edinburgh.' The reference to the large-print edition was truly Ruskinian, for he abhorred cheap editions, and he detested circulating libraries. The warning as to the *Bride of Lammermoor* struck me at the time as a curious contrast to the opinion expressed by Mr Gladstone to the effect that *this* novel was Scott's masterpiece. I somehow believe that I quoted that opinion to Mr Ruskin, and was under the impression that it accounted in some way for his spirit of opposition. Well, Ruskin took advantage of my correspondence to ease his mind on the question of Scott, but left me to my own resources in discovering the guide-book to his philosophy. And to my boyish view (and I hope I have retained some of that vision which served its purpose well enough 'in the spring-time of life, at the golden gates of morning') what a philosophy it was! The hot flame of enthusiasm for 'all things lovely and of good report' was more than a mere passing beacon to me; and, of all writers, he, more than any other, gave me 'eyes' to see. That to-day I do not see with him as I did matters little, at least to any one but myself. Even to-day his intolerance seems to me to have something of the picturesque about it. As far as my experience went, he narrowed the philosophy of life down to the truth as he preached it. He rose in anger against those who did not see eye to eye with him. He was supersensitive, overdelicate, ignorant of a vast side of human life, and the natural outcome was his superb intolerance. But his purpose was towards the stars, and as he was eminently capable and uniformly brilliant he was readily forgiven.

I remember on one occasion Ruskin threw a large quarto at my head because, with the enthusiasm inspired by the ignorance of youth, I dared to question the artistic excellence, in the matter of proportion, of Michelangelo's 'Moses' in Rome. After the throwing was over, he asked, 'How often have you seen it?' 'Oh, half-a-dozen times,' I answered, with confidence on my side as to the result of such a reminder. 'Good heavens!' he cried, 'no man should dare to give an opinion on any work of art unless he has seen it every day for six months;' adding, after a pause, 'and even then he should hold his tongue if he has used his eyes as you seem to have used them.' Forthwith he dragged me out to the National Gallery, and compelled me to give an opinion off-hand on every picture I saw. I confess I felt proud of that quarto, and I think for some time I expected every great man I met to assail me with a handy weapon, only hoping use would not be made of any of the family china, of which we were rather proud! The sequel to this story is of interest. Some time afterwards I heard Ruskin arguing the matter from the very opposite standpoint, and depreciating the 'Moses.' Being very young and ingenuous, and not trained in diplomacy, I reminded him of this discrepancy in his consistency, and was told that the fault lay not in the point of view, but in the age of the person who possessed it. Which, after all, is not an uncommon method of criticism; for to what man of authority is not youth an unforgivable sin?—unless indeed it be given to appreciation and adulation, which latter practices, it must be admitted, are not to be despised even in the aged, and even although they lead to the perpetuity of error and to swollen heads, for it is better to go astray in admiration than in depreciation.

I remember at another time Mr Ruskin came into my room and looked at a small—and to me insignificant—drawing of flowers by a friend in Edinburgh. That very morning we had been together to the Scottish National Gallery, and this fact served to emphasise the sweeping nature of his criticism. He looked at the trifle for a moment—it was a study in autumn leaves, carried out with that faithfulness to detail which pleased him so much—and then said, 'That is the finest picture in Edinburgh.' It was a typical piece of Ruskinian estimation. On another occasion I was reading Sir John Lubbock's pamphlet on *The Best Hundred Books.* He took it out of my hand, and cried in a tone of fiery indignation, '*The Best Hundred Books!* Was such nonsense ever

uttered since men were born on earth? Have you ever read one good book thoroughly?' I remember I was rash enough to admit that I had. 'How often have you read it?' he asked. 'Oh, two or three times,' I answered. 'You can never know a book until you have read it at least twenty times,' was his final dictum.

The last time I saw Ruskin I showed him a photograph of himself which I had bought, and asked him if he would be so good as to write his name upon it. He looked at the picture for a moment, and then, without hesitation, tore it up and threw it into the fire. 'It does not do me justice,' he said. 'It does not show the good that is in me—I mean, the capacity I possess for the work that I do. I shall send you another one.' This valued picture, though not so pleasing as the one that had inspired my purchase, vividly recalls the rugged yet sensitive face of the æsthetico-ethical philosopher, who saw little good in the academic philosophies; who declared that any bank-clerk could have written Grote's *History of Greece*, and that no one should read Darwin's *Origin of Species*, for the simple reason that it is man's duty to know what he is, not what he was; and who held that it was a crime to read Gibbon, as no one should be concerned with the decline and fall of anything, but about its birth and renaissance. As I have said, he seemed to me altogether a splendid rouser if an impossible guide.

Another man given to what appeared to me at the time as rash generalisations was William Morris, a poet who was one of my earliest stimulators in the region of the decorative arts. I have in my possession a letter he wrote to me in the summer of 1886. I was writing at the time an essay on eighteenth-century literature for one of the University societies, and having talked with the poet on the subject of Sterne and Steele, I wrote to him in regard to certain criticisms which he had made in my hearing. Part of this letter is worthy of quotation: 'Macaulay I conclude to be a big-wig merely. Johnson as a literary man is not worth a moment's consideration. Burke I have not even looked at. Boswell I look on with some respect, but to class him with serious authors would be absurd. In short, except for Defoe, the eighteenth century is absolutely devoid of works of art, and it is only from that point of view that I care to look on the subject.'

In contrast to this criticism on the author of *Rasselas* I must place a letter I received from Wilkie Collins, that genial-souled, clear-visioned novelist, who at one time commanded a position in literature that would startle a generation that has almost forgotten the author of *The Woman in White*. Mr Collins was very kind and courteous to me when I visited him, and my anxiety to see more of him was turned to the deepest regret by his death. 'I am very much pleased,' he said, 'to hear that you like what I wrote to *The Pall Mall Gazette* about books. There appeared to me to be such a large infusion of cant, conceit, and claptrap in many of the letters offering advice to readers that I wrote rather to protest good-humouredly than to offer a formal list of books of my own devising. If, however, it had been within the scope of my design to do this, my unfeigned admiration and respect for Johnson, both as a man and a writer, would have put him in a foremost place. I should specially have ventured to recommend the noble poem called *The Vanity of Human Wishes*, and that masterpiece of profound criticism and vigorous English style, *The Lives of the Poets*.'

I remember very distinctly the day, when travelling from Birkenhead to London, the train stopped at some wayside station—I cannot remember which—and an alert, soldier-looking figure entered, whose vigorous movements immediately attracted my attention. A few moments after the train had resumed its progress south he spoke to me, and the frankness of his speech, the general commonsense of his observations, and the straightness of his critical blows gave me more the impression of a clear-sighted, tolerant man of the world than that of the poet who wrote *Sordello* and *Sludge the Medium*. At the time I had no idea that I was talking to Browning; it may be of interest to observe that not once during the journey was literature mentioned. He treated all my immature opinions on affairs with a splendid patience and a kindly sympathy, although he was not averse to some splendid strokes straight from the shoulder at certain contemporary characters that need not be mentioned. He struck me as remarkably level-headed, free from cant, humbug, and tittle-tattle. He gave me the impression of something very virile and very sane, a man who 'saw life steadily and saw it whole,' one who, as George Meredith in a letter to me said of John Stuart Blackie, 'took the healthy view of life.' Somehow I am rather glad that I did not know that I was speaking to Browning; the fact would have inspired so great an awe—for there is no snobbery so powerful as intellectual snobbery—that I should have been paralysed with fear and respect, and that would have lamed our free and frank intercourse. Of one thing I am certain—of all railway journeys that one seemed the shortest and the most full of human sunshine. I lived for a few hours basking in the blaze of a splendid optimism—a hatred of cant, of pose, of literary and intellectual affectation. In recalling our conversation I contrast the simplicity of Browning's speech and outlook on life with the intellectual and literary complexities of his art. The man and his 'shop' were two different things, except in so far that he conveyed in his conversation the 'All's well' doctrine of his poesy. Before we parted he asked for my name and address. The diffidence of youth prevented me from returning the compliment, so when we parted I was left in ignorance as to the personality that had so fascinated me. A few days afterwards, however,

the secret was revealed, for the post brought me a photograph of Robert Browning, the poet, enclosed in a sheet of paper on which was written the following extract from *In a Balcony:*

> I count life just a stuff
> To try the soul's strength on, educe the man
> Who keeps one end in view, makes all things serve.

As Browning was an intimate friend of the family, I had hopes that I might be privileged to meet the poet again; but shortly afterwards death intervened to make impossible what was not, I hope, mere idle curiosity.

Browning's great contemporary, Tennyson, I was not privileged to meet; but I remember well passing him in a lane near to Farringford, and it struck me how much he resembled a woman of the harem as he turned his head away and drew his cloak closer about him, as if only too conscious that I was about to observe him minutely, for in his later days he grew curiously morbid in his distaste of being scrutinised by an admiring world, and took every precaution to protect himself against such observation.

Matthew Arnold was unknown to me except through correspondence, but it is pleasant for me to recall that he went out of his way more than once to advise me on matters pertaining to research on educational matters. All his recommendations were to the point and of great value, and all he did was done with a rare grace and, I could not doubt, at considerable pains to himself; he was generous enough not only to point out authorities but to forward copies of his educational reports to assist me in the work I had on hand.

(To be continued.)

THE HOUSE OF WHISPERS.

CHAPTER IV.—SOMETHING CONCERNING JAMES FLOCKART.

IN the spreading dawn the house-party had returned from Connachan and had ascended to their rooms, weary with the night's revelry, the men with shirt-fronts crumpled and ties awry, the women with hair disordered, and in some cases with flimsy skirts torn in the mazes of the dance. Yet all were merry and full of satisfaction at what one young man from town had declared to be 'an awfully ripping evening.' All retired at once—all save the hostess and one of her male guests, the man who had entered the library by stealth earlier in the evening and had called Gabrielle outside.

Lady Heyburn and her visitor, James Flockart, had managed to slip away from the others, and now stood together in the library, into which the gray light of dawn was at that moment slowly creeping.

He drew up one of the blinds to admit the light; and there, away over the hills beyond, the glen showed the red flush that heralded the sun's coming. Then, returning to where stood the young and attractive woman in pale-pink chiffon, with diamonds on her neck and a star in her fair hair, he looked her straight in the face and asked, 'Well, and what have you decided?'

She raised her eyes to his, but made no reply. She was hesitating.

The gems upon her were heirlooms of the Heyburn family, and in that gray light looked cold and glassy. The powder and the slight touch of carmine upon her cheeks, which at night had served to heighten her beauty, now gave her an appearance of painted artificiality. She was undeniably a pretty woman, and surely required no artificial aids to beauty. About thirty-three, yet she looked five years younger; while her husband was twenty years senior to herself. She still retained a figure so girlish that most people took her for Gabrielle's elder sister, while in the matter of dress she was admitted in society to be one of the leaders of fashion. Her hair was of that rare copper-gold tint, her features regular, with a slightly protruding chin, soft eyes, and cheeks perfect in their contour. Society knew her as a gay, reckless, giddy woman, who, regardless of the terrible affliction which had fallen upon the brilliant man who was her husband, surrounded herself with a circle of friends of the same type as herself, and who thoroughly enjoyed her life regardless of any gossip or of the malignant statements by women who envied her.

Men were fond of 'Winnie Heyburn,' as they called her, and always voted her 'good fun.' They pitied poor Sir Henry; but, after all, he was blind, and preferred his hobbies of collecting old seals and dusty parchment manuscripts to dances, bridge-parties, theatres, aero shows at Ranelagh, and suppers at the Carlton or Savoy.

Like most wealthy women of her type, she had a wide circle of male friends. Younger men declared her to be 'a real pal,' and with some of the older beaux she would flirt and be amused by their flattering speeches.

Gabrielle's mother, the second daughter of Lord Buckhurst, had been dead several years when the brilliant politician met his second wife at a garden-party at Dollis Hill. She was daughter of a man named Lambert, a paper manufacturer, who acted as political agent in the town of Bedford; and she was, therefore, essentially a country cousin. Her beauty was, however, remarked everywhere. The Baronet was struck by her, and within three months they were married at St George's, Hanover Square, the world congratulating her upon a very

excellent match. From the very first, however, the difference in the ages of husband and wife proved a barrier. Ere the honeymoon was over she found that her husband, tied by his political engagements and by his eternal duties at the House, was unable to accompany her out of an evening; hence from the very first they had drifted apart, until, eight months later, the terrible affliction of blindness fell upon him.

For a time this drew her back to him. She was his constant and dutiful companion everywhere, leading him hither and thither, and attending to his wants; but very soon the tie bored her, and the attractions of society once again proved too great. Hence for the past nine years—Gabrielle being at school, first at Eastbourne and afterwards at Amiens—she had amused herself and left her husband to his dry-as-dust hobbies and the loneliness of his black and sunless world.

The man who had just put that curious question to her was perhaps her closest friend. To her he owed everything, though the world was in ignorance of the fact. That they were friends everybody knew. Indeed, they had been friends years ago in Bedford, before her marriage, for James was the only son of the Reverend Henry Flockart, vicar of one of the parishes in the town. People living in Bedford recollected that the parson's son had turned out rather badly, and had gone to America. But a year or two after that the quiet-mannered old clergyman had died, the living had been given to a successor, and Bedford knew the name of Flockart no more. After Winifred's marriage, however, London society—or rather a gay section of it—became acquainted with James Flockart, who lived at ease in his pretty bachelor-rooms in Half-Moon Street, and who soon gathered about him a large circle of male acquaintances. Sir Henry knew him, and raised no objection to his wife's friendship towards him. They had been boy and girl together; therefore what more natural than that they should be friends in later life?

In her schooldays Gabrielle knew practically nothing of this man; but now she had returned to be her father's companion she had met him, and had bitter cause to hate both him and Lady Heyburn. It was her own secret. She kept it to herself. She hid the truth from her father—from every one. She watched closely and in patience. One day she would speak and tell the truth. Until then, she resolved to keep to herself all that she knew.

'Well?' asked the man with the soft-pleated shirt-front and white waistcoat smeared with cigarette-ash. 'What have you decided?' he asked again.

'I've decided nothing,' was her blank answer.

'But you must. Don't be a silly fool,' he urged. 'You've surely had time to think over it?'

'No, I haven't.'

'The girl knows nothing. So what have you to fear?' he endeavoured to assure her.

Lady Heyburn shrugged her shoulders. 'How can you prove that she knows nothing?'

'Oh, she has eyes for nobody but the old man,' he laughed. 'To-night is an example. Why, she wouldn't come to Connachan, even though she knew that Walter was there. She preferred to spend the evening here with her father.'

'She's a little fool, of course, Jimmy,' replied the woman in pink; 'but perhaps it was as well that she didn't come. I hate to have to chaperon the chit. It makes me look so horribly old.'

'I wish to goodness the girl was out of the way!' he declared. 'She's sharper than we think, and, by Jove! if ever she did know what was in progress it would be all up for both of us—wouldn't it? Phew! think of it!'

'If I thought she had the slightest suspicion,' declared her ladyship with a sudden hardness of her lips, 'I'd—I'd close her mouth very quickly.'

'And for ever, eh?' he asked meaningly.

'Yes, for ever.'

'Bah!' he laughed. 'You'd be afraid to do that, my dear Winnie,' added the man, lowering his voice. 'Your husband is blind, it's true; but there are other people in the world who are not. Recollect, Gabrielle is now nineteen, and she has her eyes open. She's the eyes and ears of Sir Henry. Not the slightest thing occurs in this household but it is told to him at once. His indifference to all is only a clever pretence.'

'What!' she gasped quickly; 'do you think he suspects?'

'Pray, what can he suspect?' asked the man very calmly, both hands in his trouser-pockets, as he leaned back against the table in front of her.

'He can only suspect things which his daughter knows,' she said.

'But what does she know? What can she know?' he asked.

'How can we tell? I have watched, but can detect nothing. I am, however, suspicious, because she did not come to Connachan with us to-night.'

'Why?'

'Walter Murie may know something, and may have told her.'

'If so, then to close her lips would be useless. It would only bring a heavier responsibility upon us—and'—— But he hesitated, without finishing his sentence. His meaning was apparent from the wry face she pulled at his remark. He did not tell her how he had, while she had been dancing and flirting that night, made his way back to the castle, or how he had compelled Gabrielle to go forth and speak with him. His action had been a bold one, yet its result had confirmed certain vague suspicions he had held.

Well he knew that the girl hated him heartily, and that she was in possession of a certain secret of his—one which might easily result in his downfall. He feared to tell the truth to this woman before

him, for if he did so she would certainly withdraw from all association with him in order to save herself.

The key to the whole situation was held by that slim, sweet-faced girl, so devoted to her afflicted father. He was not quite certain as to the actual extent of her knowledge, and was as yet undecided as to what attitude he should adopt towards her. He stood between the Baronet's wife and his daughter, and hesitated in which direction to follow.

What did she really know? he wondered. Had she overheard any of that serious conversation between Lady Heyburn and himself while they walked together in the glen on the previous evening? Such a contretemps was surely impossible, for he remembered they had taken every precaution lest even Stewart, the head gamekeeper, might be about in order to stop trespassers, who, attracted by the beauties of Glencardine, tried to penetrate and explore them, and by so doing disturbed the game.

'And if the girl really knows?' he asked of the woman who stood there motionless, gazing out across the lawn fixedly towards the dawn.

'If she knows, James,' she said in a hard, decisive tone, 'then we must act together, quickly and fearlessly. We must carry out that—that plan you proposed a year ago!'

'You are quite fearless, then?' he asked, looking straight into her fine eyes.

'Fearless? Of course I am,' she answered unflinchingly. 'We must get rid of her.'

'Providing we can do so without any suspicion falling upon us.'

'You seem to have become quite white-livered,' she exclaimed to him with a harsh, derisive laugh. 'You were not so a year ago—in the other affair.'

His brows contracted as he reflected upon all it meant to him. The girl knew something; therefore, to seal her lips was imperative for their own safety. She was their enemy.

'You are mistaken,' he answered in a low, calm voice. 'I am just as determined—just as fearless—as I was then.'

'And you will do it?' she asked.

'If it is your wish,' he replied simply.

'Good! Give me your hand. We are agreed. It shall be done.'

And the man took the slim white hand the woman held out to him, and a moment later they ascended the great oak staircase to their respective rooms.

The pair were in accord. The future contained for Gabrielle Heyburn—asleep and all unconscious of the dastardly conspiracy—only that which must be hideous, tragic, fatal.

(To be continued.)

THE EMERALD-MINES OF COLOMBIA.

By Miss M. Watson.

THE emerald is a stone justly prized for its beauty and durability, and on account of its rarity it is to-day one of the most valuable, if not the most valuable, of the precious stones. The attempt to make emeralds by artificial means has hitherto been a failure, for in all the experiments the green colour has been lost at a certain temperature.

The emerald is a six-sided prism, with basal planes; it is found in all shades, from a very pale to an almost black-green. Emeralds are classified according to their colour; their value depends upon their colour, size, freedom from flaws, transparency, spark, and general lustre. First-class stones seldom exceed one hundred carats in weight, but much larger stones have been found which were of great value although not of the very first quality. Some twenty years ago a valuable stone was discovered weighing two thousand five hundred carats (one pound of sixteen ounces), and again eight years ago another of similar weight was found; but as a rule these stones are not of good quality.

Emeralds are found in horizontal veins running through the rocks and conforming to no known law or order. Miners come suddenly upon a nest or pocket of stones embedded in calcite veins, but they are quite unable to locate their position beforehand. No other precious stone is found with them. But in one mine, at Muzo, a very rare crystal of amber tint has been discovered, very brittle and of little value as a cut stone, but praised by mineralogists; it is seldom larger than a filbert, and has been named parisite, after its discoverer, Señor Paris.

Aquamarines, so called from their resemblance in colour to sea-water, are of the same composition as emeralds, and hence has arisen a common belief that emeralds are extracted from the bottom of the sea. A certain mystery may have surrounded their origin, because they are only found in two or three places in the world, and their occurrence is so capricious. A mine may be worked in vain for years, and then, with no change in the surrounding strata, the miners may come all at once on a rich pocket containing precious stones enough to repay many times the wasted time and labour.

The first emeralds of which we have any account came from mines known to have existed in Egypt and the borders of the Sudan; but about these stones there has been some controversy; and it has been asserted that they were not true emeralds, but green sapphires. Be that as it may, beautiful emeralds from South America were first introduced into Europe at the end of the sixteenth century, and

from this period up to the year 1830 all the emeralds which came into the market were brought from Colombia, then called Nueva Granada, and from 1830 to the present day 90 per cent. still come from that country, the remaining 10 per cent. being obtained from mines in the Ural Mountains and from Norway.

What a marvellous, fabulous, magnificent tale is that of the conquest of South America by the Spaniards, when they swooped down on the treasure-house of gold and silver and precious stones, and loaded their galleons with them! The demon of greed must have had a merry time. But, after all, the danger and the adventure, the risk of life and limb, nourished a less ignoble demon than is his modern representative, who concerns himself in peaceful England with the rise and fall in the price of shares in those mines whose wealth was fought over more than three hundred years ago by Englishmen and Spaniards in hand-to-hand mortal combat. Emeralds from these very Colombian mines may have been in the laden treasure-ships so triumphantly towed into Plymouth harbour by Drake, and he may have presented them to his royal mistress to cool the fear-inspired anger with which she was prepared to receive him after his bold defiance of the king of Spain.

There are no known emerald-mines in Peru or Mexico, but at the time of the Spanish conquest many large and beautiful emeralds were found in the possession of the natives of those countries. These probably came from Colombia, where the rich mines from which the natives obtained the rough stones were easily discovered. The name 'Peruvian emerald' came into general use, but it is inaccurate.

The Spaniards first learnt of the existence of Colombian emeralds on 3rd March 1537, through a gift of emeralds which was offered to the Spanish conquerors by the Indians, who at the same time pointed out the source from whence the stones were derived. This spot, known as Somondoco, lies about one hundred and twenty-five miles distant from Bogotá, the capital of the country, on the eastern slopes of the eastern range of the Andes mountains, and from the heights of the mines can be seen the vast plains which stretch clear to the Atlantic, threaded through by the river Upia, a tributary of the great Orinoco River, which winds its way, shining like a silver ribbon in the sunlight, across the tremendous expanse. Here the Indians brought their conquerors, and they had that reward which a weak man reaps when he reveals his treasures to one stronger than himself.

Old records describe minutely the journey of Captain Pedro Fernandez de Valenzuela to the mines of Somondoco: how he was carried on the backs of Indians all the way, and how he and his soldiers extracted emeralds from the veins running through the rocks. We can see to-day the very workings where the first white men sought for the precious jewels, for the mine has been recently rediscovered by a Colombian explorer; the quarries and the reservoirs cut in the rock for holding up the water-supply are in excellent preservation, large sections of a very long ditch are still standing after being abandoned for nearly two hundred years, and it is generally believed that these mines, when properly reopened and worked, will produce large quantities of stones.

There is another deposit about two miles distant on the western slope of the same eastern range, situated in the country of the wild Muzo Indians. These Indians for a long time resisted successfully the Spanish attempts at conquest. They were partially subdued in 1555 by the Spanish under Louis Lancheso, who founded the present Muzo village. In spite of the continued hostility of the Indians, the mining of emeralds was commenced in 1558 at an old mine in the mountains of Itoco, of which all trace is at present lost.

The Spaniards were not content with taking the accumulated treasure of the Indians, with stretching greedy hands over their mines, but they enslaved the Indians themselves, and made them work by forced labour under cruel treatment to extract the wealth of which Spain could never have enough—wealth which she squandered in vain attempts to establish a religious despotism in Christendom. Service in the mines was made compulsory for the neighbouring Indians, and one of the methods employed in order to prevent them from running away from the mines was to make them dig a deep pit at the mouth of each tunnel too wide for any one to jump across. Four Indians were placed in each of these self-made prisons and forced to tunnel deeper into the rock in search of emeralds. Food was handed in to them across the pit, and they handed emeralds out in the same way. By this method one Spanish sentinel could patrol a great number of Indians; this was most important, as the Spanish soldiers were always insufficient in numbers to subdue the neighbouring tribes and guard the mines at the same time in those early and strenuous days.

The Indians were quite unaccustomed to this hard, continuous work. They had mined for themselves at their own sweet will; they found it a very different matter to serve the Spanish taskmaster, and whenever they could they moved out of the Spanish sphere of influence. This resulted in so serious a depopulation of the country that the priests, who had begun the work of Christianising the Indians, sent up a memorial to the king of Spain representing the cruelties to which the Indians were subjected, and the hardship it was on a free people to drive them to forced labour to which they had never been accustomed. The king listened, since it was priests who spoke—in a good cause this time. He gave his royal approval to the memorial, the Indians were set at liberty, and the mines abandoned—so wholly abandoned that they were lost sight of till 1825, when they were rediscovered by Señor Paris, who held a lease of them for many years

under the first President, General Simon Bolivar, at the termination of the War of Independence.

Until two years ago the Government had not given much support to the mine-owners. For instance, the selling and purchasing of stolen emeralds was not a criminal offence, and this being so, it was considered quite the right thing to do to buy as many stolen stones as possible—that is to say, public opinion had no condemnation for men who made profit out of the thefts of the miners. However, during the last two years the Government has changed its policy and supported the present lessees in many ways, and the buying and selling of stolen emeralds is now a punishable offence. And so the old mines are once more busy with thronging workers as in the days when the Spanish first took possession of that treasure-house of gold and jewels; and lovely emeralds, holding in their hearts a lustre and brilliancy unsurpassed by the emeralds of the days of Philip II., still stir the pulse of the seeker.

The method of emerald-mining was unchanged from the early days of the Spaniards until recent years. The mines were exploited by means of tunnels and galleries; but now open workings have been adopted in order to render possible a stricter supervision of the works and to avoid loss from thieving, and it has proved also a more remunerative process. It is rather similar to quarrying. The walls of the mine are very steeply inclined; the rock in which the emeralds are found is loosened from the wall of the mine, and allowed to fall to the bottom, where it is smashed by the force of the impact. It is then washed away through a canal by a sudden discharge of water from the reservoirs above the mine. Great care is exercised not to bar away the calcite veins until the emeralds have been taken from them. The rock in which the excavations are made is a dark, bituminous limestone; this rests on clay slates, and contains ammonites, showing it to be of Lower Cretaceous age.

The miners are of the same race as those who were so cruelly driven to work by their conquerors in the sixteenth century, but they have come back to the long-disused mines under very different conditions. They are Indians, only half-civilised according to our ideas, but excellent fellows in many respects. They have been Christianised by the Roman Catholic priests, who have a great influence over them for good. The Indians hold the priest in great respect at all times and in all places. The arrival of '*el Señor Cura*' at a mine on the occasion of a special feast or to bless the works at the mine is an affair of considerable importance. His intended visit is announced a day or two ahead, and certain preparations are made. The road or bridle-path is cleared of vegetable growth on either side, fallen trees are removed, and frequently the best horse or saddle-mule is sent and placed at the priest's disposal—a big white mule or horse is most appreciated—and a large white umbrella is procured for his use. The priest is almost always accompanied by some notable civil servant, and Indian runners go ahead to announce his approach. The blessing of a mine is an extremely solemn affair, and not a word or a sound is heard among the audience even when as many as five hundred workers are on the ledges of the mine which is receiving the blessing.

The Indians mingle a considerable amount of superstition with their faith, and have not yet grasped the why and wherefore of modern inventions. They still look with terror on the telephone, and associate the electric sparks which may be seen proceeding from it in a dark room with the devil. Work in the mines commences at five-thirty A.M. and terminates at five-thirty P.M. There is one hour for breakfast, nine to ten A.M.; another for drinking, from one to two P.M. Every Indian is allowed to eat and drink as much as he sees fit, but only in these hours; and a fine is imposed if any Indian is found carrying drink to his work. Their beverage consists of fermented black sugar and water, and sometimes a little ground maize-meal mixed into it. It is not injurious if drunk at a proper stage of fermentation, and the brewer in charge is responsible for it. The food allowance is two pounds of beef and soup made of ground maize-corn and the beef-broth. There is very seldom any change from week to week. Vegetables consist of the cassava and banana. A steer is consumed at the breakfast meal, and another at the five o'clock dinner.

The Indians have very strong objections to working on a feast-day, and many superstitions prohibit their doing so; these feast-days are rather too numerous to suit serious undertakings, but they have to be observed. June is the month most fruitful in days of festivity, and about eight days are lost to work. The feast consists of drinking *ad libitum*, some chanting of songs, and some monotonous chords on a sort of mandoline.

No women are allowed in the mines, and the parting of the Indian from his squaw takes place at the gates. The term of service is three months, at the end of which time he can ask for all his earnings and go to the mountains to his mud-walled hut and acre of land, which his squaw has tilled and planted to the very last foot of ground with every sort of grain, vegetable, and herb, whilst pining for the return of her mate. There are some forty or fifty going, and about the same number returning, every month from the Royal Mines. This title of 'Royal' has been preserved from the time when these mines were worked for the benefit of the Spanish Crown. It is considered a great privilege to be a miner at the Royal Mines.

So the days are gone of wild romance, of Spanish conquest, and the rivalry of England, of the exploits of Drake and Hawkins and Raleigh, and the treasure-ships laden with untold gold and jewels; and still there is treasure hidden in those rugged mountains, and still men's lives are spent in the seeking of it. If the glamour of romance is colder than it was, if trade and trade principles have taken the place of

the high-handed methods of the sixteenth century, these days are yet not without the thrilling excitement of the moment when the pick breaks into a pocket of precious stones, and the old English qualities of pluck and resource and endurance are still called into play before these stones are all secured and conveyed safely to the coast and shipped for Europe.

THE INVISIBLE MARQUIS OF GALLANTREVE.

CHAPTER III.

THE solicitors demurred a good deal when Maurice Armelin announced to them that he intended to present the case to the judge, and, if he failed there, also to address the jury. This, they held, was contrary to the advice of the old solicitor who had been so familiar with the estate, and who had made so close a study of the facts; but Maurice pointed out to them that the ultimate opinion of this learned man was that the Court of Appeal must decide, therefore he could lose the case in the lower court as well as any, and he was determined to take his chance, showing them a letter from the Marquis of Gallantreve expressing a wish to this effect; so they gave way, reluctant and unconvinced, to this determined youth who proved so immovable when once he had made up his mind.

The Paris papers made much of the coming lawsuit, not only because of the vast interests involved, but also on account of the mystery surrounding the eleventh Marquis of Gallantreve. He was said to be residing in Italy; but no one knew where, and the most enterprising of the journals failed to find a trace of him. He had completely disappeared, and nobody in Paris had ever seen him, nor could anything be learned of him since he was a lad. It was said that the young *avocat* who would plead his case was a cousin; but even of him very little was known, except that he had entered the law-schools of Paris, had made no brilliant mark there, but, on the other hand, had led a blameless, studious existence until now, through favour of his aristocratic relative, this great opportunity had been given him, and public curiosity was aroused to know what he would do with his chance.

Maurice Armelin greatly pleased the lawyers, but disappointed the public in his address to the presiding judge. The readers of the newspapers considered his discourse dry and uninteresting; but lawyers saw he had suppressed all rhetoric, if he were gifted in that way, and knew that very few men could have explained so intricate a subject with equally close reasoning, placing the facts in such an irresistible array that for the moment they thought he must be victorious. He claimed judgment for the plaintiff, but did not receive it. The judge wavered, and, having the right of leaving decision to the jury, evaded responsibility, saying the case must go on.

Although at first the Maurice Armelin who addressed the jury was the same as the Maurice Armelin who had presented the points of law to the judge, he perceptibly changed as he went on with his speech after setting out with great plainness the illegal devices by which Gastyn Maillot came into possession of the property at a tithe of its value. The jury seemed rather sleepy and absent-minded up to this point, but by-and-by they woke up. He pictured this young Frenchman in exile, cheated through no fault of his own of everything he should have possessed. He dwelt with tender pathos on Henri Francet's love for the place where he was born, by whose streams he had wandered as a child, through whose forests he had rambled as a lad. He touched the sentiment that lurks in the heart of every Frenchman—the love of the land. He played on this as a skilled artist plays on a harp; he gave them a living picture of the rivulets, the woods, the streams, the meadows, the little lakes, until all within sound of his voice wished they were out of the stifling room and wandering in the delightful region he described; and it was not a young nobleman for whose rights he pleaded, but a friendless, penniless lad, who dared not set foot on the ground his forefathers had owned. Some women sobbed, and the applause of the men was sternly suppressed by the officers of the court. It was expected that he would draw a vivid, personal sketch of the grim ironmaster, a millionaire over and over again, a raiser of rents, a grinder of the faces of the poor, for at his works some years before a bitter strike, still unforgotten, had been suppressed by the military, and all readers of newspapers knew the determined character of Gastyn Maillot. But the young *avocat* never mentioned him, and he seemed to know instinctively the right moment to stop.

'Gentlemen,' he concluded, 'this is a case where law and justice coincide,' and so sat down.

And now the courtroom rang with cheers that could not be suppressed. The crowd was not thinking of the absent Marquis of Gallantreve, but of the young *avocat* who in a week had leaped from the unknown into fame.

'He'll never need starve for lack of cases,' was the general opinion of the men in the street. The jury brought in a verdict for the plaintiff on all counts, and judgment was given accordingly.

It was not as a dust-covered tramp that Maurice Armelin appeared the second time before the ancient gatehouse, but in the newest creation of a Parisian automobile factory; the machine driven by a smart chauffeur, attired in the Gallantreve livery. The

wrought-iron gates were thrown open, and the noiseless autocar glided up the avenue, and swung round to a precise stop in front of the château steps. Armelin presented his card to the footman, and asked audience with Monsieur Maillot.

'Monsieur Maillot,' said the menial, with polite surprise, 'has been dead this year and a half.'

'Dead!' echoed his astonished enemy. 'I did not know that. Who, then, fought the action in Paris?'

'It was his daughter, Mademoiselle Maillot. But we think little of the action in Paris, monsieur,' said the servant, with quite superior scorn. 'Mademoiselle agrees with the verdict, but she will buy the estate from the Marquis de Gallantreve.'

'Oh, indeed! Well, as I represent the Marquis de Gallantreve, perhaps mademoiselle would be good enough to receive me.'

Maurice Armelin was shown into a drawing-room, and, being left alone there, smiled to think what sublime confidence rich people showed in the ability of unlimited wealth to accomplish whatever they wished. Buy the estate! She might as well speak of buying her way into heaven. He would not sell a foot of the land for all the wealth of all the ironmasters in Christendom. Josslyn's farm he would give to Josslyn and to Marie Angelique; but love, not wealth, would accomplish that transfer. He pictured to himself the purse-proud old maid, hard daughter of a hard father, who boasted she would buy the estate; and yet that did not coincide with what the lady had said about the verdict. Agreed with it, did she? Well, that was rather a unique attitude for a defeated suitor.

And now there entered to him, with a certain impulsiveness of graceful action, a beautiful girl of eighteen, who advanced swiftly towards him, holding out her hand.

'Ah, monsieur, you are the young and clever *avocat* who represents Monsieur le Marquis? Monsieur, I am pleased to greet you.'

He took the small hand.

'Mademoiselle,' he said, 'I accept the word "young," but disclaim the other adjective. I tried to do my best for my client.'

'And you did! and you did! I heard your address to the jury, and it made me weep. You did not know it, but you appeared for both plaintiff and defendant, monsieur. All you said of that poor, wandering young man's love for this place I myself have felt. I love every foot of this ground. I thought sometimes you were talking for me, instead of against me.'

'Ah, mademoiselle, I had not met you then.'

'No,' she replied brightly; 'and that is what makes it so strange that you should have described my thoughts just as if I had confided in you. There—in noisy, terrible Paris, which frightens me—I closed my eyes while you were speaking, and saw instead the lovely river Rille, so quiet and peaceful. I suppose the Marquis himself told you all about it.'

'Yes, mademoiselle.'

'Have you known him all your life?'

'We were boys together.'

'Ah, he chose a good interpreter! We thought, with all our array of great men, that we would sweep you into oblivion, but it was David and Goliath over again, wasn't it?'

Maurice laughed a little.

'Mademoiselle, you cover me with confusion.'

'Oh no, I do you but justice! I am your most enthusiastic admirer, and I assure you if I had known what was to be brought out in court—if I had heard your side of the question—I never would have permitted the case to be defended, and I am sure my father would have come to the same conclusion had he been alive.'

The young man bowed. He was not quite so confident of the ironmaster's sense of fairness, but he said nothing.

'Has the Marquis returned to Paris?'

'Yes; I am here in his automobile.'

'Why did he not come himself?'

'I suppose, mademoiselle, he thought it better to wait until all preliminaries were arranged by me.'

'Ah yes, I see; until I was turned out,' said the girl, resting her elbow on the table and her dimpled chin in her open palm. Her clear, innocent, intense gaze the young man found somewhat disconcerting. He had had no experience with women, except so far as Marie Angelique was concerned.

'Then let us talk business,' said the girl with a sigh. 'As I suppose you know, I am very rich; and, as I told you, I love this old château and all that belongs to it. I beg you to make Monsieur le Marquis an offer for the domain. I will pay whatever value he sets upon it.'

'Mademoiselle, I should be sorry to leave you under any illusion in this matter. The Marquis will not part with the property.'

'Not for any price?'

'Not for any price, mademoiselle.'

Mademoiselle bent her eyes in silence on the carpet; her bosom rose and fell with an emotion she strove to conceal. Disappointment brought her to the verge of tears.

Maurice Armelin clenched his hands nervously together as he looked at her—they two, as it were, alone in the world.

At last she glanced up again, having resumed control of her feelings. She smiled rather waveringly, and said, 'Does Monsieur le Marquis not recognise that I have some claim to the Château de Gallantreve?'

'Your claim, mademoiselle, was settled in the Paris courts.'

'Ah, I do not mean that. You may not know, of course; but my mother, whom I am proud to say I resemble very much, was a distant relative of the Gallantreve family. In this château she first met my father. They loved each other, and married. The House of Gallantreve never recognised her again. She was, according to them, an

outcast. Their action, I think, was cruel. My father it embittered, all because of his love for my mother; but she—she never cared. I remember her very well—I was fourteen when she died. Always a serene, gentle lady, completely happy in her marriage, not once regretting it, for my father, counted harsh by many, never said anything but kind words to her. 'Oh dear!' cried the girl, springing impulsively to her feet, 'I must not talk of this. Come with me, monsieur, I beg of you. I shall show you something.'

(To be continued.)

THE KING'S FOREIGN SERVICE MESSENGER.

ALTHOUGH the emoluments are not great, and the duties are fatiguing, while the latter grow after a period somewhat monotonous as well, the post of King's Foreign Service Messenger is highly prized. There are two branches of the King's Messenger Service—namely, home and foreign. The duties of the former being merely to convey despatch-boxes and letters to and from the Palace and from house to house of various officials, they are naturally on an entirely different footing from the Foreign Service Messengers, who are entrusted with the conveyance of despatches to and from His Majesty's embassies and legations in certain capitals and the Foreign Office. Nominations to these latter appointments rest with the Secretary of State for Foreign Affairs, subject to a qualifying examination in a foreign language (either French, German, or Italian), arithmetic, horsemanship, and bodily health. Candidates, who must be between the ages of twenty-five and thirty-five, are invariably gentlemen of good social position and standing, but it was not ever thus. The service was anciently performed by officers of the College of Arms, from whose hands it drifted into those of nominees of the nobility—their valets, butlers, or sons of such domestics. When Canning assumed the premiership in 1827 he very properly put a stop to this latter practice, which had been attended by some shameful breaches of trust. In consideration of the confidential relations necessarily existing between the King's messengers and the members of the diplomatic service abroad, and of the fact that the bearers of important despatches are of necessity admitted to the presence of the highest personages in their own and other countries, he took every opportunity of filling up the vacancies as they occurred with a very superior class of young and intelligent men—proficient linguists, accustomed to good society, and capable of acting in any emergency with the spirit and discretion that usually accompany such advantages. It is, indeed, strictly necessary that they should be gentlemen of whom something is known, and not the chance winners of an open competition.

The number of King's Foreign Service Messengers has varied from time to time, from sixteen towards the close of the eighteenth century to eighteen during the period of international difficulties culminating in the Crimean war. Since then the number has been gradually reduced to seven, which is the present strength of the corps. It was eight prior to the death of a messenger in the recent wreck of the *Berlin*, after which it was announced that the vacancy thus created would not be filled up, and that, owing to the ever-increasing facilities of communication, the staff might undergo still further reduction as posts fell vacant in the future. The movement towards effecting economies in all Government departments, and particularly in those which enjoy a certain amount of social prestige, has also been largely responsible for the dwindling strength of the corps. Where our embassies and legations are located in foreign cities accessible by sea, it is now customary to consign the despatch-bags, provided that they do not contain missives of urgent importance, by His Majesty's warships. Consequently capitals like Lisbon and Constantinople have been almost completely struck off the fixed routine of the Foreign Messenger Service. Then, for the same reason, the pay is not as good as it was. Formerly the messengers enjoyed salaries of from four hundred pounds to six hundred pounds per annum; to-day only the head-messenger receives as much as four hundred pounds, the remaining six two hundred and fifty pounds apiece. However, there is an allowance of one pound per diem for subsistence whilst they are on active duty, all travelling expenses being, of course, defrayed by the Government. A messenger is rarely in active employment for more than one hundred and fifty days in the year; hence the average sum-total of the emoluments of office may be set down as four hundred pounds per annum.

The regulations enjoin a special uniform—namely, 'dark-blue cloth double-breasted frock-coat, with turn-down collar; blue single-breasted waistcoat, buttoned up to the throat, with edging of gold lace; trousers of Oxford mixture, with a scarlet cord down the side-seams; gilt buttons, embossed with the royal cipher, encircled by crown and garter, and having a greyhound pendant; blue cloth cap with leather peak, and band of black braid, and royal cipher and crown in front.' Nevertheless, a long period has elapsed since last a King's Foreign Service Messenger went forth on his travels attired in this kit—a glorified postman. But if the uniform is honoured in the breach, the regulation as to the wearing of the badge of office, a silver greyhound, suspended from the neck by a dark-blue ribbon, is religiously observed, albeit the insignia is tucked away under the coat; for this

badge proclaims the King's messenger as the servant of the Ambassador, for the time being clothed with his master's diplomatic immunity. It is the magic passport which renders him exempt from every species of visitation and search in passing through foreign territories; holds him inviolable from all actions, suits, writs, and processes; and ensures his person and despatches being considered sacred. The badge must always be worn by messengers when travelling, but not at any other time, not even at levees or State entertainments.

It is wrong to suppose that a King's messenger is liable to be packed off at a moment's notice to any spot on the face of the earth. He is now only called upon to perform journeys on a fixed routine, recurring at regular intervals, and to certain capitals only, principally Paris, Berlin, Vienna, and St Petersburg. When he returns to London from foreign service he is placed at the bottom of the list of those at home available for duty. He must not, however, count upon any precise period of leisure with too much certainty, as some foreign crisis may suddenly arise to denude the roster. A story is told of a messenger who, having according to schedule a clear fortnight of leisure, decided to spend it on the Riviera. Hardly had he arrived there when he was astonished by receiving the following cryptic telegram from the chief clerk of the Foreign Office: 'You are fast and dirty. Return at once.' He promptly obeyed the instruction, and found that sudden and unexpected pressure of affairs of State had brought his name to the top of the roll of messengers in waiting. The telegram had been mauled by foreign telegraph-clerks in transit; it should have read, 'You are first on duty,' and not the opprobrious epithets which prefixed the summons as it reached him.

Before the advent of the railway system on the Continent the life of the King's messenger was one of real adventure, and many are the tales of hardship and peril which have been told of the journeys in those days when lengthy and adventurous rides on horseback were common incidents. In 1850 Colonel Townley rode from Belgrade to Constantinople, through a country teeming with brigands, during which he was for three consecutive days and nights in the saddle without quitting it. Sir Henry Layard performed the same journey a few years later, when the country was in a hardly less unsafe condition, galloping day and night without stopping in relays of post-chaises. Except in times of war, the King's messenger's adventures are now reduced to the possible chance of a railway smash or shipwreck.

The *Berlin* disaster was accompanied by the loss of a junior member of the distinguished corps, Mr Arthur Herbert, and it may be noted that the only prior case of a fatality on active service occurred a century previously. This latter, however, forms one of the great unsolved mysteries of modern times. The victim was Mr Benjamin Bathurst, who was carrying His Majesty's despatches from the Court of Vienna. On November 25, 1809, he arrived at Perleberg, a small German town, at midday, and halted at the post-office for refreshments and fresh horses. In the evening he ordered the horses to be ready for the next stage to Leuzen, *en route* for Hamburg. He stood outside the inn watching his luggage being placed on the carriage, stepped round to the heads of the horses, and was never seen again. Every effort was made by the civil and military authorities to trace Bathurst. Bloodhounds were employed to track the lost man, but in vain. Every well was explored and river dragged, every suspicious house in Perleberg was examined from attic to cellar, woods were searched and gardens turned up, but all to no purpose. A month later two poor women found on the road to Quitzow a pair of gray trousers with two bullet-holes in them, but no traces of blood. In the pocket was a half-finished letter from Bathurst to his wife, stating that he was afraid he would never reach England, and that his ruin would be the work of French spies. Mrs Bathurst went to Paris and obtained an interview with Napoleon, who laid his hand on his heart and gave her his word of honour as an Emperor that he knew nothing of her husband's fate. So rests the disappearance of Mr Bathurst, King's messenger, an unsolved mystery.

Two curious stories are told of attempts to kidnap messengers with their despatches. A messenger was proceeding to Athens by steamer. When the vessel was on the point of entering the harbour of Piræus, a British man-of-war's boat was observed pulling towards the steamer and hailing her to stop. The messenger concluded that the boat was sent to convey him ashore, and requested the captain to heave to. Suddenly another British man-of-war's boat appeared from the opposite quarter, the crew of which were signalling violently, whereupon the first boat turned and rowed away rapidly. On the arrival of the second boat it transpired that the former was a plant, engineered, it was supposed, by Russian emissaries. She was a bogus man-of-war's craft, manned by men masquerading in British uniform and flying the British flag.

Some years ago a King's messenger found himself benighted at a hospice on one of the Alpine passes, owing to the somewhat mysterious breakdown of the sleigh by which he was travelling. In the course of the evening a stranger halted at the hospice for refreshment, and hearing of the messenger's anxiety to proceed, offered him a seat in his sleigh. The messenger eagerly accepted the invitation, and the pair set off. They had not gone far when a figure jumped out from behind a rock, the horses shied across the road, the sleigh was tilted over, and the messenger was flung out on to a snowdrift. Picking himself up and collecting his scattered senses, he saw, greatly to his amazement, the sleigh tearing back the way it had come, the driver flogging the horses. His despatches were in the sleigh. The messenger plodded back to the hospice, and there ascertained that the sleigh had stopped

for a few seconds, the owner explaining that he had met with a slight accident, and had transferred his companion to an overtaking vehicle. The despatches were never recovered.

And what are the despatches which the King's Foreign Service Messengers are entrusted to convey 'safely and expeditiously by whatever means they may have occasion to travel'? The major portion of them consists of 'private letters,' so called, passing between the Secretary of State on the one hand and our Ambassadors and Ministers abroad on the other. In the ordinary sense, these missives are not private letters at all; they relate to public affairs. Yet they are private property, and not State papers. They are the outcome of the system by virtue of which public correspondence may be called for by Parliament. They contain matters which could not appear in the Blue Books. These 'private letters' play a most important rôle in the working of our diplomacy; they are the real source of the information which our Government possesses as to the secret doings and intentions of another. And among the 'private letters' there are always a few which relate to such momentous secrets that they dare not be entrusted to the sealed despatch-bags. The messenger must never lose sight of the latter, though owing to their bulk and weight they may be handled by porters. The 'very private letters of very private letters' he, however, carries on his person, and his instructions are to destroy them immediately in the event of his personal safety being endangered.

Thirty or forty years ago, perhaps even more than now, the King's Foreign Service Messenger was a personage of the first importance on the road. He was known and bowed down to by all as the bearer of His Majesty's despatches. In the present day, however, travelling, as he does, always in civilian attire by train or steamboat amongst the ever-increasing crowd of tourists, some of the comfort and more of the prestige of a journey with despatches have waned. Nevertheless, the King's messenger still claims the earliest attention from guards and porters, civility and expedition at the Customs-frontier, and the best places in the train and steamboat, where a strictly reserved compartment and private cabin respectively are placed at his disposal.

THE GUARDING OF A GOD.

By Brew Molohan.

IN TWO PARTS.—PART I.

THE Resident moodily pulled at his cheroot. 'Personally, of course, I am very glad to see you, Butler,' he remarked; 'but I must tell you candidly that I have no use for special correspondents in Guzampore just now.'

The man addressed elevated his eyebrows quizzically, his lean brown face showing just the slightest trace of amusement. 'I guessed there was something in the air,' he replied; 'old Wetherall doesn't usually pay a special correspondent for merely descriptive matter. But I did not know that it was so serious. Anyway, Fletcher, you can comfort yourself with the knowledge that I know to a nicety what is good for the readers of *The Eastern Age* and what is not.—You will vouch for me, Carleton, will you not?' turning to a military-looking man who was perusing a long official document.

The latter looked up and laughed. 'Well,' he said, 'I really can't go as far as that; but I might warn you, Fletcher, that if there is anything you particularly wish to keep dark, Butler will find it out.'

'And in such a case,' supplemented the correspondent, 'I might think it my duty to the paper and the public to let the light of day shine on it.'

The Resident took a few turns round the room before resuming his seat. 'Your editor,' he said, 'may or may not have been right in supposing that the condition of affairs in Guzampore warrants the expense of a special correspondent; but what I am about to tell you must never figure in the columns of a newspaper. I am afraid that events are shaping themselves which may make the province a magnet for the public eye in the near future; but, until then, you will be conferring a great favour on me if you will regard the following information as confidential. I have your promise?' he asked.

The other nodded; and Carleton, laying down the report, looked at the speaker with interested eyes.

'On that map,' resumed the Resident, pointing to the wall, 'you will see that Guzampore is the most northerly of the semi-independent states lying along the border; and, from its position, you will understand that it is impossible for us to allow it to be governed by anybody not in sympathy with British rule. For some time now I have had suspicions that Ramzhan ed Din has been truckling to the emissaries of that Power which is ever a menace to the frontier; and when the papers announced that His Highness had sent the Viceroy a courteous invitation to be allowed the privilege of entertaining Her Majesty's Sixty-first Regiment for a month, I hoped that nobody outside the official circle would guess that this mark of loyalty was only brought about after much persuasive persistence. I seem to have been mistaken, however,' he added meaningly.

Carleton laughed outright. '*The Eastern Age* must be a particularly well-informed journal,' he observed. 'The first intimation that I was detailed to come along in advance to prepare for the troops came from Butler, with an offer of his society on the way up.'

'Having obtained the invitation,' continued the Resident, 'I hoped that the Rajah would also grant a seemingly unimportant concession. In this I was mistaken, however, and I greatly fear that this visit of our troops, which was intended to impress Ramzhan with a diplomatic show of force, will result in a serious blow to British prestige and a positive danger to the welfare of the men.'

Carleton started. Then a picture of the Sixty-first, now only half-a-dozen marches away, flashed to his brain, and he replied with a half-smile, 'I think, Fletcher, that a regiment of British soldiers has not much to fear from any force the Rajah of Guzampore can put in the field; and, as we shall be encamped a mile from the walls, you may take it from me that there will be no danger of a surprise.'

The Resident laughed bitterly. 'You mistake my meaning, Carleton,' he said. 'See that temple over there?' and he pointed to a graceful dome standing clear against the cloudless sky. 'Well, that is the danger you have to guard against.'

The soldier gazed at him blankly. 'What do you mean?' he asked.

'That temple,' replied the Resident, 'contains a sacred statue of Siva, and set in the forehead of the god is the most wonderful ruby the world has ever seen. What I fear is that some of the men will meet their death trying to steal that jewel. No, no! I'm not jesting,' he explained, noting the soldier's impatient movement; 'but I have sufficient acquaintance with Tommy Atkins to know that if a bait—and such a bait—is dangled before his eyes, with the invitation, "Take it if you dare," he is not slow in *daring*. Let me explain.

'A detachment of the Rajah's bodyguard is under arms in the compound during the day, but at night it is withdrawn and the temple left unguarded. When you consider how close we are to the wild hill-tribes you will see that there must be some reason that the jewel has never been stolen. That idol, Carleton, is possessed of some terrible power which instantly avenges every attempt at sacrilege, and so widely known is its reputation that there have been comparatively few attempts at robbery.'

'There have been attempts, then?' interjected Butler quickly.

'Only one in my time, by a gang of Dacoits. One night a band of these fierce spirits, maddened probably with *bhang*, raided the temple. When the Brahmans went in at sunrise to bathe the idol with the scented waters, they found no less than six bodies stretched on the platform in front of the god. Being sceptical of the supernatural powers attributed to the statue, I obtained permission to examine the bodies; but in no case could I ascertain the cause of death. There was not the slightest trace of a wound, and the features were as composed as if they were asleep.

'I am afraid,' he continued, 'that the men may try to steal the ruby out of pure dare-devilry. Strolling in the bazars, they will be told of the jewel by the Rajah's emissaries, and will be gulled with stories of its unguarded condition. It will be a constant temptation, and if they enter the temple at night their fate is sealed. I need hardly tell you what incalculable harm it would do us if any of the soldiers were to fall a victim to the god.'

Carleton nodded gravely. His ten years in the country had taught him that in out-of-the-way provinces the lesson of the great Mutiny is but a memory, and that the native mind at times needs but the slightest spark to set it aflame.

'I suppose,' he said, 'we couldn't place a guard round the temple at night?'

'No; it would cause an outbreak immediately; and, besides, it would give the Rajah grounds for complaint that we were interfering with the religious susceptibilities of his subjects.'

There was a long silence, broken at last by Butler. 'Is there a legend in connection with the ruby?' he asked.

'Yes; I had it from the Rajah himself. Many years ago the founder of the temple was prostrated in devout adoration before the god, when he was attacked by an evil spirit in the form of a lizard, and bitten in the left heel. Rather than be disturbed in his meditations, however, the holy man endured the wound in silence, until, exhausted by the loss of blood, he sank in a dead faint in front of the idol. Siva, in recognition of the fortitude displayed by his servant, caused the red drops to run together, and transformed them into the wonderful jewel which ever since has adorned the forehead of the statue. Whatever its origin may be, Butler, that stone is without a peer in the world, and holds the eye like a veritable ball of fiery radiance. When you look at it you realise the significance of its name: "The Life of the God."'

'And is it only at night that it is dangerous to enter the temple?'

'Apparently so. At sunset the worshippers leave, and a Brahman climbs to a platform on the great gateway, and, after reciting a prayer of adoration, calls: "Oh ye Faithful! enter ye not the Presence during the hours of darkness, or ye shall incur the anger of the God." At sunrise,' he continued, 'the Brahman again climbs to the platform to announce that the people may now enter the temple; and, as the idol has more than a local reputation, the place is crowded during the daytime.'

'I suppose,' remarked Butler, 'the Brahmans would not object to my entering the temple. I must do something for the paper, you know.'

'Oh no. I have been in there on several occasions. The best time is in the morning, just after sunrise, because there won't be many worshippers about. Sorry I can't accompany you, but

I have to point out the site of the camp to Carleton.'

. . . . . .

The sun was just making his appearance over the horizon on the following morning as Butler approached the great gate that opened into the compound. He was gazing curiously at the magnificent carving, when suddenly a shrill voice overhead burst into a long prayer of glorification, concluding with the summons: 'Lo, ye Faithful! the hours of danger are past, and Siva, the God of Gods, awaits your adoration.'

Four times the call was repeated as the white-robed priest turned to each point of the compass; and, as the summons died away, a body of native soldiery, about fifty strong, debouched from a side street and stationed themselves in various parts of the compound.

Arrived at the entrance to the temple itself, the correspondent was almost overcome by a wave of penetrating incense from the censers swung by the white-robed priests as they passed and repassed through the columns of pillars; and now and again, through the heavy blue smoke, came a faint, subtle aroma, awaking some half-forgotten memory as his eye followed the flitting figures.

The block for the offerings of the faithful was placed beside a pillar near the door; and, taking a couple of rupees from his pocket, he was placing them in the dish, when they clumsily slipped through his fingers just as a priest, droning an invocation to the god, was passing by. The Brahman involuntarily paused as the money clattered at his feet; and Butler, stooping to pick it up, shot a glance of apology at the grave, ascetic face bent upon him.

The altar was situated on a platform approached by a flight of wide steps; and, as he drew near, his eyes were caught and held by the monster ruby, glowing like a live coal in the forehead of the idol. For the moment it seemed an enormous eye, the scintillating flame of the solitary lamp which burned in front of the shrine imparting to it a curiously life-like effect.

The idol was squatting in the usual position, and over it a canopy, supported on four grotesquely carved figures, ran up to and through the low roof. As if the idol were secure in the knowledge of its power, the shrine was absolutely unenclosed; and Butler realised how terribly deadly that power must be to prevent the priceless jewel from being stolen.

Turning to the body of the temple, he examined the arrangement of the pillars, noting that the censer-bearers had disappeared and the blue smoke had almost cleared away. For a few moments he gazed casually round, and then quietly left the building, his mind busily revolving an idea as he strolled through the narrow streets towards the Residency.

'Well, what do you think of the ruby?' asked Fletcher.

'I could not have believed that there was such a stone in existence,' he replied; 'it ought to be worth a couple of columns in *The Eastern Age*. I can quite appreciate the temptation it will be to the troops.'

The Resident groaned.

(*To be continued.*)

IN POISON-LAND.

AWAY among the deep forests in the heart of the Malay Peninsula there dwell a singular people whose curious habits are only partially understood. An Italian explorer found them so interesting that he spent fifteen years in studying their habits and customs, and has some wonderful stories to relate about the Sacai. They live in a barbarous state, spending most of their time in gathering poisons from plants, which they prepare according to secrets known only to themselves, for protection against their enemies and for bringing down their quarry in the chase. Instead of living in villages, they build huts at a distance of several hundred yards from each other. As a result of this they are scattered throughout the country, yet they have a perfect system of communication by means of which they can assemble within a very short time to meet a common foe. They have everything in common, like one large family, and live so freely together that they come and go in each other's huts uninvited, eating and drinking and accepting hospitality for which they neither think of offering thanks nor are expected to do so.

Until he has won their confidence, the stranger who ventures among them is not permitted to share in this good-fellowship. On the contrary, unless he goes through various formalities, proving to the Sacai his friendly intentions, they greet him with a poisoned arrow, the effect of which is certain death. His surest passports are presents of tobacco, rice, and beads. With a sufficient supply of these, the traveller may wander at will, and if his quest be orchids he is sure to find sufficient rare varieties in those dark woods to repay the small outlay.

So accustomed are the Sacai to the life in the woods that the few who have been at various times induced to go down to the coast have almost invariably returned to their native wilds on the first favourable occasion. There they hunt game and birds and gather the fruits on which they subsist. Though life has its dangers, it has also its compensations. Nature is particularly rich in her bounty, and abundance of berries and food-stuffs is found on the bushes and giant trees, among which fly birds

of rare and gorgeous plumage. But what proves most attractive to the natives is the great variety of poisonous plants. They speak about the different poisons as familiarly and as often as we speak about the weather, and the discovery of a new kind or combination is hailed as an event of the greatest importance. The reason for this is because the poison is used in killing game and catching fish, and for the preservation of their independence; the various concoctions being mixed according to the resisting power of the object for which they are intended. Thus, for instance, the hunter would never think of wasting a strong poison on a small animal he considered unworthy of such an honourable distinction. Besides, he must study to bring down such game as he afterwards uses for food with poisons which will in no way affect him.

Poisons are not difficult to find. Growing among the rank grasses and on the trunks of trees, and mingling with creeping flowers, are so many poisonous plants that the traveller must be constantly on the lookout to avoid them. Some are so deadly that even the odour arising from them is overpowering, causing serious illness; others cause skin diseases and painful swellings of the body if their leaves chance to touch ever so lightly the hands or other exposed parts. For this reason the orchid-hunter cannot be too careful, since it is usually where these dreaded plants flourish most abundantly that the alluring white, red, purple, blue, and many-coloured orchids are found to thrive most luxuriantly.

In spite of his extraordinary passion for concocting poisons, the Sacai is a thorough gentleman in the chase and a worthy foeman to meet. He is a big-hearted fellow, having none of the barbarous methods of other inhabitants of the Malay Peninsula, whose greatest pleasure is to torture a fallen foe. When he poisons an arrow his object is to cause death as quickly and as painlessly as possible. For this reason the Malays respect and fear him, and tell harrowing stories about his conduct in the constant skirmishes between these two irreconcilable peoples. Yet to the credit of the Sacai be it said that he scorns to send his poisoned arrow after a flying foe.

One curious feature of the Sacai—who, by the way, resent this designation, preferring to be called Mai Dazat—is that they have no form of government and no chiefs. The nearest approach to government is the respect they sometimes show to the old men in the districts, whose advice they seek on occasion, but do not always follow. There are instances, however, where the old men have formed themselves into a council and manage to exercise a certain influence over their immediate family connections. But that is merely local, for the race as a whole hates any form of ordered government as thoroughly as it dislikes all kinds of regular or hard work. They are primarily huntsmen, recognising no laws save those which Nature herself forces them to obey.

As might be expected, the Sacai's views of life are as simple as are his requirements. He seems to be particularly happy in his domestic affairs. Husband and wife live happily together, and quarrelling or ill-treatment is practically unknown among them. In the event of a mother-in-law upsetting the peace of the home by interfering with its arrangements, the young couple adopt the wise plan of pulling down their hut and building a new one at a respectable distance from the cause of disturbance. The children show much love and respect for their parents, who allow them unlimited freedom to amuse themselves and follow their own pursuits. Other admirable traits of this strange people are their care for the sick, their readiness to help their comrades in need, and their extraordinary love for all kinds of animals.

THE UNKNOWN LOVE.

When the evening sun is slanting,
When the crickets raise their chanting,
And the dewdrops lie a-twinkling on the grass,
As I climb the pathway slowly,
With a mien half proud, half lowly,
O'er the ground your feet have trod I gently pass.

Round the empty house I wander,
Where the ivy now is fonder
Of your memory than those long gone away;
And I feel a sweet affection
For the plant that lends protection
To the window whence you looked on me that day.

Was it love or recognition,
When you stormed my weak position
And made prisoner my heart for evermore?
For I felt I long had known you,
That I'd knelt before the throne you
Graced in Pharaoh's days or centuries before.

Though your face from me was hidden,
Yet the balm was not forbidden
On your coffin just to see the wreath I sent.
Though no word had passed between us,
Yet I felt that God had seen us
And had joined your heart to mine e'en as you went.

Let them talk of love and marriage,
Honeymoon and bridal carriage,
And the glitter of a wedding *à la mode!*
Could they understand the union
Of two hearts in dear communion
Who were strangers in the world of flesh and blood?

In my eyes the tears are welling
As I stand before your dwelling,
In my pilgrimage to where you lived, my fair.
And ere I return to duty
In this world of weary beauty,
To the stillness of the night I breathe my prayer:

When the last great trump has sounded,
When life's barque the point has rounded,
When the wheel of human progress is at rest,
My belovèd, may I meet you,
With a lover's kiss to greet you,
Where you wait me in the gardens of the blest!

THE HEART OF THINGS.

By Henry Leach.

LONDON, *Yesterday.*

ON the morning of New Year's Day, in offices and elsewhere, the covering page is torn off the block calendars that are to serve for the following twelve months, and the spectators feel not uncommonly some little thrill as the great time-marking sign-of-one is exposed: 'Friday, January 1, 1909.' People need to be of dull temperaments to be wholly indifferent to this occasion, even though it be so ancient and so regular of recurrence as are no others that do not belong to this same process of the passing of time, governed, not by man or machinery, but by the laws of the universe. If there is the leisure for it in the morning, and, if not, then at the lunch or dinner table later in the day, it happens frequently that, minds being turned naturally towards the contemplation of dates and calendars, the question is brought forward of the imperfection of our calendar system. Certainly it is imperfect, although those who have not given any attention to the matter may not have realised or understood to what extent they are constantly the sufferers in inconvenience by the circumstance. Much time that is spent in the searching for dates, many doubts that are dispelled, many mistakes that are expensive, and numerous irritations would be spared to a majority of the civilised population of the world if we had a calendar that was always even, exact, and regular. It has, indeed, been changed on a few occasions, but not for the better. There were the ten days which Pope Gregory cut out of the year 1582. Then Augustus Cæsar abolished Leap Year for twelve years. Before him, Numa Pompilius had tried the experiment of clapping two months on to the year. Even in recent times we have had some meddling with the arrangement of time, though only on a small scale. Thus, twice in the last twenty years has Capetown time been altered, once to the extent of sixteen minutes, and once to thirty. These latter were mere details of adjustment; as for larger schemes, they have mostly failed because of their own too obvious faults, and it does appear to many people that it is not until just lately that any sound sense has been brought to bear upon the question of reformation of the calendar. One of the best ideas in this respect that we have encountered was that suggested by Mr Alexander Philip, which received good commendation from Lord Avebury, Sir Oliver Lodge, Sir William Ramsay, and other eminent persons whose opinion in such matters may be regarded as of special value. One of the greatest difficulties of the would-be reformer is that the year consists of three hundred and sixty-five days, and that this number cannot be divided into twelve equal months, or into any number of complete weeks of seven days. This trouble is accentuated by the system of adding an extra day to each fourth year. From these circumstances of the three hundred and sixty-five days and the odd one every fourth year all our troubles of the calendar spring. From year to year the days of the week and of the month in their relation to each other are jumbled up and changed as in a kaleidoscope, and anything in the nature of settled order is impossible. One of the features of the perfect calendar must be equality in divisions so far as it is possible to secure it; and the second feature, equally important, if not more so, is that the same day of the week should always fall upon the same day of the month—thus, if January 5 falls on a Tuesday in one year it should fall on a Tuesday always. The gain from the establishment of such a system as this, particularly in the matter of making forward arrangements, is seen on reflection to be far greater than at the first thought had been imagined. The first consideration, as it seemed to the reformer of whom we have spoken, was to get rid of one day from the annual reckoning, so as to bring the total down to three hundred and sixty-four, which is divisible by seven. This is done ingeniously by regarding the first day of the year as a day apart, and not counting it at all, giving it a special distinction in the calendar as thus: 'I. 1909.' It is not counted as a day of the week or as belonging to any of the twelve months,

[*All Rights Reserved.*]

and this change, according to the reformer, is a matter of less consequence than might be thought, because in most places, other than England, New Year's Day is already regarded as a holiday and is of little account in the general transactions of the world. Leap Year Day, on its occurrence, is to be extinguished in the same way. It is to come between the end of June and the beginning of July, and being observed as a quadrennial midsummer holiday, is to be distinguished as 'L. 1908' or 'L. 1912.' Thus we have the even three hundred and sixty-four days left for each year, with no small margin to upset the system every four years. Although the number will divide by seven it will not by twelve; but the three hundred and sixty-four days may be arranged into two even half-years of one hundred and eighty-two days each, and four quarters of ninety-one days each. Of course the day following New Year's Day would be January 1; and now, by taking one day from our present July and another from October, and giving them both to February, we raise that month to the full size of thirty days, and, moreover, have now in each quarter two months of thirty days and one of thirty-one. Finally, take a day each from May and August and add them to June and September, and we have the even and admirable arrangement of an equal number of days in each quarter, and of the two first months in each having thirty days and the third month thirty-one. So would time be much simplified. The scheme which Mr Robert Pearce, M.P., brought before Parliament about a year ago, so far as we can discover, is identical with this one. Perhaps nobody would deny that such a system is simpler and better in every way than the one we have, and an agreement among nations would bring about its adoption with very small trouble. But in all such matters as this the people are very conservative and very fearful lest for a day they should have some extra thinking imposed upon them. They prefer to bear with their inconveniences for all time rather than add one more to them for a brief space, with the full assurance that thereafter there would be an end of all trouble. It is the same in the matter of weights and measures.

* * *

There are some who have lately been saying that London is dull. They are Americans, who have just returned to Chicago, Boston, and other places after visiting the 'White City,' and having, as some of them put it, a good run round Europe. Then some Londoners have troubled to resent the imputation, and offered a thousand reasons why the great Metropolis is not and never can be in the least dull. But they should not have done that, for in such action they betray a hypersensitiveness which is sometimes taken as a token of fear for the good of their case. Let the Americans, if it please them, say that London is a dull city, and that we are a dull folk who live in it. The American temperament is necessarily considerably different from our own. The things that have happened since the *Mayflower* sailed across the Atlantic have inevitably created wide differences in the natural tastes of the people. They are the differences of the old and the new, and they are irreconcilable. The Americans, though they often display a taste which sometimes seems exaggerated for the things that the people of old countries like best, are for the most part worshippers of the new, and the newer the better, and so we come to freakish tendencies. Here we are not so fond of the new, but more so than ever of the old. Socialism may be rampant among the lower classes, motor-cars may be running us down, flying machines may be in the air, there are many things we cannot help; but still in the matter of our innate taste our cultivated people are more conservative than ever. Therefore, those who can best appreciate our London are ourselves, and those who are like us in most matters of taste—we might say the people of Paris, of Berlin, of Vienna, who do not complain that London is dull. Now and then you may find an Englishman who is weary to the point of yawning and retiring to his rest at nine when in London town; but it is the weariness born of imperfection of knowledge and of strangeness to the capital.

A large proportion of the people prefer the open, pure, and restful life of the country, with all its delightful natural pursuits. That is a matter of temperament; but even these people, if they know London at all, do not find it too dull but rather too quick for them, and they like to visit it for a spell in each season. It seems London is essentially the one place in the whole world which is supreme for intellectual quickness. There is nothing like it, and, comparing it now with the many records that have been handed down to us of the brilliant times that were spent in London in past generations, and also receiving the testimony of the personal experience of many of the oldest townsmen who move about in the heart of the things of London, we are brought steadily and certainly to the conclusion that London is now, in the sense of its quickness and absence of dullness, better than ever it has been before. For in London there is everything. It is not one London, but a dozen, a score, yea a thousand Londons that we have in this space, and the man chooses that of them all which comes most exactly to his fancy. He fits his taste in all its complexity with the utmost precision; and, having what he needs, and being able to command that which satisfies every passing mood, how can there be dullness? It is just as Johnson said to Boswell, 'When a man is tired of London he is tired of life; for there is in London all that life can afford.' And Hazlitt was just in the sense of our own remarks when he declared that there was nothing deserving the name of society to be found out of London, and that you can pick your society nowhere but in London. It is the testimony of old Londoners like these, who were part of London itself, who loved it fiercely and resented the smallest aspersion upon it, that is the best worth taking.

We have them still. But Dr Johnson and Cyrus K. Higgins of Boston would have been poor company for each other. The one was and the other is a most excellent man, but they have been bred with different tastes and their view-points are not the same.

* * *

It is not often that a book of personal reminiscence, or indeed any other kind of book, reaches the reading public in the way that Lady Priestley's *Story of a Lifetime* has done, and still fewer are the times when the public is so fortunate as in this case. Lady Priestley was a daughter of Robert Chambers the elder, one of the founders of this *Journal*, and, among many other circumstances and accomplishments, the friend and biographer of Sir Walter Scott. At an early age she married a young doctor, who, as Sir William Priestley, achieved the utmost distinction in his profession before he died, a little more than eight years ago. During her very active and always very thoughtful lifetime, and particularly during the middle period of it when her husband had established his success, she was brought into contact with many of the most interesting people of the day, and we have anecdotes of them all the way through this book. Naturally, a large proportion of the people who are brought thus into our view belonged to her husband's profession, and such a bookful of rich doctors' anecdote we have not encountered before. The reader, in a retrospective mood, feels at the end of the book that, despite his entertainment, he has some cause for reproach against Lady Priestley in that virtually she only gave him this work under compulsion. The circumstances of its being written and published were, as she explains, simply these: that some five years ago it was written at the express desire of her children, and was put into print for them alone. The first small family edition soon ran out, and a few copies were reprinted for friends, and it so happened that this edition 'gradually spread into the borderlands of the unknown public,' and forthwith there were applications for it at the libraries, printers', and elsewhere. Journalists wrote to Lady Priestley asking for permission to review it. She resisted all importunities for some time; but at last, and with some misgivings and alarm, she has consented to the book being issued to the public in the ordinary way, as it has been, through Kegan, Paul, & Co. In the course of the small space that is available here it is not possible to do more than suggest by occasional pickings here and there the richness and variety of the contents. Of Lady Priestley's earliest recollections there are several that concern Sir Walter Scott. 'On one occasion,' she tells us, 'when my father was helping Sir Walter in his library at Abbotsford to arrange some papers and bills, Sir Walter was not satisfied with the method adopted for folding the bills. He therefore instructed the youth how to do it in a systematic way. In the course of a certain number of years I was helping my mother in a similar bit of work, and was in all probability folding the bills as my father had once done, when all of a sudden that dear parent pounced down upon me to show me how they ought to be done according to Sir Walter Scott. I have followed the plan ever since, history thus repeating itself in a curious way.' As all know, Robert Chambers anticipated the theories and methods of Darwin in his *Vestiges of the Natural History of Creation*, published anonymously; but, though strongly suspected of the authorship in some quarters, even by Darwin himself, he kept the secret until his death. Upon his decease, but before the secret was broken, Darwin wrote to Lady Priestley's sister: 'Several years ago I perceived that I had not done full justice to a scientific work which I believed and still believe he [Dr Chambers] was intimately connected with, and few things have struck me with more admiration than the perfect temper and liberality with which he treated my conduct.' The anonymity, it should be mentioned, was necessary, owing to the state of religious feeling in Scotland at that time. The ideas presented would not have been tolerated, or at all events it would have gone hard with the man who presented them. To this Dr Chambers, in his capacity as editor, we have Thomas De Quincey writing a timid, hesitating letter, in which he expresses his desire, if (this with much emphasis) it is quite agreeable to the editor, to write a series of essays for the *Journal*, beginning with one on 'Conversation as an Art.' He had heard that the editor had been worried with the labour connected with essays written for the paper. 'Nobody,' he said, 'could have the presumption to press his aid upon so eminent a public instructor as yourself in any other character than that of one who happened to have disposable leisure, offering to relieve another who had too little. If, upon that footing, you really have any wish for aid'—— Times have changed since those methods of exaggerated urbanity availed De Quincey. At the end of his letter he said: 'I am at present, and for three or four months to come, condemned to fight off creditors with one hand, whilst with the other I furnish support to nine persons daily.' And then he again apologised for his intrusion.

In a later period of the book, when there are Dickens and Thackeray on the scene, there are many interesting tales about them, and Lady Priestley relates, on the authority and in the words of Sir Theodore Martin, the story of the reconciliation of those two. Thackeray and Sir Theodore (then Mr) were talking together in the hall of the Athenæum Club when Dickens passed on his way to the staircase and the library. 'Suddenly Thackeray broke away from me, and overtook Dickens just as he had reached the foot of the staircase. Dickens turned to him, and I saw Thackeray speak, and presently hold out his hand

to Dickens. They shook hands, a few words were exchanged, and immediately Thackeray returned to me, saying, "I am glad I have done this. I said," he continued, "'It is time this foolish estrangement should cease, and that we should be to each other as we used to be. Come, shake hands.'" Dickens, he said, seemed at first rather taken aback, but he held out his hand, and some friendly words were exchanged. "I loved the man," said Thackeray, "and could not resist the impulse." It was like his tender nature, to which the rupture of a once-cherished friendship was an unforgettable pain. A few weeks after, I was reminded of the incident by seeing Dickens standing by the open grave into which Thackeray had just been lowered, and looking down into it with a look of earnest sadness.' And Lady Priestley continues a sad sequence by relating that on Christmas Eve of that same year she went to join a family dinner-party in Kensington at which Thackeray was expected to be present. His place at the table had been laid, but only an hour before the news of his death had reached the house.

In their early days in London the young Doctor and Mrs Priestley had close association with that Dr Simpson who was afterwards Sir James, and who performed such a high service to humanity by his introduction, against great prejudice, of the use of anæsthetics. While canvassing for a certain professorial chair he found that his then single blessedness was against him, and on the question that he put to many hesitating voters as to whether they would vote for him if he were married being answered in the affirmative, he went off post-haste that night for Liverpool, plunged headlong into a peaceful abode of cousins, carried off his wife by capture the next day, and then proceeded to gather up the threatened votes. One time many years later, when he was in the depths of his interest in the powers and possibilities of chloroform, Lady Priestley says that she 'had the doubtful pleasure of crossing the Channel with him on a boisterous day *en route* to Paris, whither on hospital inquiry he was bent, and where he intended to join his friend, Mr Pender (later Sir John, M.P.), at the Hotel du Louvre. In a letter to my husband at the time,' she says, 'I see that I suffered considerably from his devoted attentions on board. When he saw me growing pale he took a box of chloroform-pills from his pocket, and, longing for a chance of trying an experiment, he said, "Take a pill, darling." As I could not swallow it without water, he sent his son Magnus downstairs to fetch some; then through the winds and the waves came the voice of the charmer, "Swallow one now, dear," and down it went. Alas, that terrible pill!' In another place it is said: 'The Professor used to try his experiments with chloroform on the girls. He was then just introducing it, and with some of the liquid simply poured on a handkerchief would have half-a-dozen of us lying about in various stages of sleep. Our mother feared nothing, and was only too delighted to sacrifice, if unavoidable, a daughter or two to science.' There is a pretty tale of Wilkie Collins, who was a friend of the family. Lady Priestley's twin-sister had written to him at the time that *The Woman in White* was appearing in parts, declaring her inability to wait any longer in anxiety about the fate of certain of the characters, and calling for a special divulgence of the same. The author wrote back: 'I beg to assure Miss Chambers, solemnly, that nobody about whom she is interested, and over whom the undersigned can exercise benevolent control, shall come to any harm. If she will look at the number published to-morrow she will see that Laura is *not* murdered, and in another week she will know that Anne Catherick *is* caught. In the same two numbers Miss Halcombe's whereabouts is satisfactorily ascertained, and Miss Halcombe's recovery positively asserted.'

Another good doctor-story is of the period when Sir William Priestley was rising on the flood-tide of his success. Sir Charles Locock one night gave a 'medical dinner,' to which he and other distinguished physicians and surgeons were invited. Sir William—he was not knighted at that time, but, for convenience, we are using the title throughout—riveted the attention of the company by giving them the riddle of the three-pint can to solve thus: A girl is sent to the well with a three-pint can and a five-pint can, and is told to bring four pints of water. How is it done? We are told that soon the leading physicians of London were lost in thought over the profound problem. Some were at work with pencils on their linen cuffs, others were elaborating on the back of their menus, when it dawned on the propounder that he had forgotten the answer! 'He felt there was no time to be lost—matters were getting serious; there was nothing for it but to send over to me for the answer. Accordingly, somewhere towards midnight I was aroused out of my first sleep to take in a letter marked "urgent." Messages coming to our house at all hours of the night caused no surprise; the house was accustomed to them; but on this occasion it was not a patient who was ill, but an assembly of doctors who were destined to spend the night, if necessary, at the other end of the street, in trying to find out how that girl contrived to get four pints of water out of the three-pint can and the five-pint can. I recognised at once the urgency of the case, but it took me some precious moments to clear my brain of sleep before I could send the answer. Mercifully, it arrived in time to save the situation and my husband's reputation among his brethren.' Sir William eventually came into the most intimate association with Pasteur, and many of the most interesting pages of the book concern him. Lady Priestley knew him well, and when he died she and her daughter were the only ladies outside the family who were bidden to the funeral. 'He was always exact,' she says. 'Discussing the religious opposition to science, he said very quietly, "Well, I always see God through science." He further remarked during

this conversation, "I could never work for money, but I could always work for science." This from a man who could have been the richest the world had ever known had he chosen to keep his secrets to himself!' Of how, with the perfection of tact, Lady Priestley after a dinner-party at her house once paid Pasteur a splendid compliment which caused various French Academicians who were present to go forward to thank her 'for the honour she had done France;' of numberless anecdotes concerning other celebrities, some still living; of some delightful travellers' stories about things seen and people met in different parts of Europe and America, the book must be left to tell its own tale. Knowing the circumstances under which the book was written, and for whom it was written, one is not quite sure how far it is proper to quote from certain parts of the narrative which are of an intimate domestic character; but as they are published we may take the risk. Miss Chambers was seventeen and young Priestley, hopeful for his career but only a beginner and exceeding poor, was twenty-five when they were betrothed. They waited two years before they were married. 'Looking back across the years that have since intervened,' she writes, 'I can see myself at that period anxiously trying to qualify myself to be the wife of a poor man. I began to make my own clothes, trim my bonnets, and even re-cover my white satin shoes! Strict economy was the order of the day, and the things I never thought of before I thought of now. I persuaded my mother to hand over the housekeeping to me, and for two years there was a régime of comfort, tempered with economy, never before known in that hospitable house.' And for the first two years of the married life, conducted most economically and thriftily, all the professional fees were put into a money-box that was opened annually, the original capital dwindling all the time. But at the height of his success Sir William Priestley was making ten thousand pounds a year as his professional income. There is something ineffably charming in the simple little story of the bride's beginning. One supposes that the same thing is happening every day still, and it is a pity that the cynical among us should feel the harsh contrast that is presented in such a large proportion of young womanhood of the time, even an educated and cultivated section, conceiving it to be the supreme duty to scream in public for fanciful rights, and to glory in being sent to prison therefor. The cynic is rather inclined to believe his aged grandmother when she mutters that girls now are not what they were in her young days.

THE HOUSE OF WHISPERS.

CHAPTER V.—THE MURIES OF CONNACHAN.

ELISE, Lady Heyburn's French maid, discovered next morning that an antique snake-bracelet was missing, a loss which occasioned great consternation in the household.

Breakfast was late, and at table, when the loss was mentioned, Gabrielle offered to drive over to Connachan in the car and make inquiry and search. The general opinion was that it had been dropped in one of the rooms, and was probably still lying there undiscovered.

The girl's offer was accepted, and half-an-hour later the smaller of the two Glencardine cars—the 'sixteen' Fiat—was brought round to the door by Stokes, the smart chauffeur. Young Gellatly, fresh down from Oxford, begged to be allowed to go with her, and his escort was accepted.

Then, in motor-cap and champagne-coloured dust-veil, Gabrielle mounted at the wheel, with the young fellow at her side and Stokes in the back, and drove away down the long avenue to the high-road.

The car was her delight. Never so happy was she as when, wrapped in her leather-lined motor-coat, she drove the 'sixteen.' The six-cylinder 'sixty' was too powerful for her, but with the 'sixteen' she ran half-over Scotland, and was quite a common object on the Perth to Stirling road. Possessed of nerve and full of self-confidence, she could negotiate traffic in Edinburgh or Glasgow, and on one occasion had driven her father the whole way from Glencardine up to London, a distance of four hundred and fifty miles. Her fingers pressed the button of the electric horn as they descended the sharp incline to the lodge-gates; and, turning into the open road, she was soon speeding along through Auchterarder village, skirted Tullibardine Wood, down through Braco, and along by the Knaik Water and St Patrick's Well into Glen Artney, passing under the dark shadow of Dundurn, until there came into view the broad waters of Loch Earn.

The morning was bright and cloudless, and at such a pace they went that a perfect wall of dust stood behind them.

From the margin of the loch the ground rose for a couple of miles until it reached a plateau upon which stood the fine, imposing Priory, the ancestral seat of the Muries of Connachan. The aspect as they drove up was very imposing. The winding road was closely planted with trees for a large portion of its course, and the stately front of the western entrance, with its massive stone portico and crenulated cornice, burst unexpectedly upon them.

From that point of view one seemed to have reached the gable-end of a princely edifice, crowned with Gothic belfries; yet on looking round it was seen that the approach by which the doorway had been reached was lined on one side with

buildings hidden behind the clustering foliage; and through the archway on the left one caught a glimpse of the ivy-covered clock-tower and spacious stableyard and garage extending northwards for a considerable distance.

Gabrielle ran the car round to the south side of the house, where in the foreground were the well-kept parks of Connachan, the smooth-shaven lawn fringed with symmetrically planted trees, and the fertile fields extending away to the very brink of the loch.

The original fortalice of the Muries, half a mile distant, was, like Glencardine, a ruin. The present Priory, notwithstanding its old-fashioned towers and lancet windows, was a comparatively modern structure, and the ivy which partially covered some of the windows could claim no great antiquity; yet the general effect of the architectural grouping was most pleasing, and might well deceive the visitor or tourist into the supposition that it belonged to a very remote period. It was, as a matter of fact, the work of Atkinson, who in the first years of the nineteenth century built Scone, Abbotsford, and Taymouth Castle.

With loud warning blasts upon the horn, Gabrielle Heyburn pulled up; but ere she could descend, Walter Murie, a good-looking, dark-haired young man in gray flannels, and hatless, was outside, hailing her with delight.

'Hallo, Gabrielle!' he cried cheerily, taking her hand, 'what brings you over this morning, especially when we were told last night that you were so very ill?'

'The illness has passed,' exclaimed young Gellatly, shaking his friend's hand. 'And we're now in search of a lost bracelet—one of Lady Heyburn's.'

'Why, my mother was just going to wire! One of the maids found it in the boudoir this morning, but we didn't know to whom it belonged. Come inside. There are a lot of people staying over from last night.' Then, turning to Gabrielle, he added, 'By Jove! what dust there must be on the road! You're absolutely covered.'

'Well,' she laughed lightly, 'it won't hurt me, I suppose. I'm not afraid of it.'

Stokes took charge of the car and shut off the petrol, while the three went inside, passing into a long, cool cloister, down which was arranged the splendid collection of antiques discovered or acquired by Malcolm Murie, the well-known antiquary, who had spent many years in Italy, and died in 1794. In cases ranged down each side of the long cloister, with its antique carved chairs, armour, and statuary, were cases of rare Etruscan and Roman terra-cottas, one containing relics from the tomb of a warrior, which included a sword-hilt adorned with gold and a portion of a golden crown formed of lilies *in relievo* of pure gold laid upon a mould of bronze; another case was full of bronze ornaments unearthed near Albano, and still another contained rare Abyssinian curios. The collection was renowned among antiquaries, and was often visited by Sir Henry, who would be brought there in the car by Gabrielle, and spend hours alone fingering the objects in the various cases.

Sir George Murie and Sir Henry Heyburn were close friends; therefore it was but natural that Walter, the heir to the Connachan estate, and Gabrielle should often be thrown into each other's company, or perhaps that the young man—who for the past twelve months had been absent on a tour round the world—should have loved her ever since the days when she wore short skirts and her hair down her back. He had been sorely puzzled why she had not at the last moment come to the ball. She had promised that she would be with them, and yet she had made the rather lame excuse of a headache.

Truth to tell, Walter Murie had during the past week been greatly puzzled at her demeanour of indifference. Seven days ago he had arrived in London from New York, but found no letter from her awaiting him at the club, as he had expected. The last he had received in Detroit a month before, and it was strangely cold, and quite unusual. Two days ago he had arrived home, and in secret she had met him down at the end of the glen at Glencardine. At her wish, their first meeting had been clandestine. Why?

Both their families knew of their mutual affection. Therefore, why should she now make a secret of their meeting after twelve months' separation? He was puzzled at her note, and he was further puzzled at her attitude towards him. She was cold and unresponsive. When he held her in his arms and kissed her soft lips, she only once returned his passionate caress, and then as though it were a duty forced upon her. She had, however, promised to come to the ball. That promise she had deliberately broken.

Though he could not understand her, he made pretence of unconcern. He regretted that she had not felt well last night—that was all.

At the end of the cloister young Gellatly found one of Lady Murie's guests, a girl named Violet Priest, with whom he had danced a good deal on the previous night, and at once attached himself to her, leaving Walter with the sweet-faced, slim-waisted object of his affections.

The moment they were alone in the long cloister he asked her quickly, 'Tell me, Gabrielle, the real reason why you did not come last night. I had looked forward very much to seeing you. But I was disappointed—sadly disappointed.'

'I am very sorry,' she laughed, with assumed nonchalance; 'but I had to assist my father with some business papers.'

'Your mother told every one that you do not care for dancing,' he said.

'That is untrue, Walter. I love dancing.'

'I knew it was untrue, dearest,' he said, standing before her. 'But why does Lady Heyburn go out

of her way to throw cold water upon you and all your works?'

'How should I know?' asked the girl, with a slight shrug. 'Perhaps it is because my father places more confidence in me than in her.'

'And his confidence is surely not misplaced,' he said. 'I tell you frankly that I don't like Lady Heyburn.'

'She pretends to like you.'

'Pretends!' he echoed. 'Yes, it's all pretence. But,' he added, 'do tell me the real reason of your absence last night, Gabrielle. It has worried me.'

'Why worry, my dear Walter? Is it really worth troubling over? I'm only a girl, and, as such, am allowed vagaries of nerves—and all that. I simply didn't want to come, that's all.'

'Why?'

'Well, to tell you the truth, I hate the crowd we have staying in our house. They are all mother's friends; and mother's friends are never mine, you know.'

He looked at her slim figure, so charming in its daintiness. 'What a dear little philosopher you've grown to be in a single year!' he declared. 'We shall have you quoting Friedrich Nietzsche next.'

'Well,' she laughed, 'if you would like me to quote him I can do so. I read *Zarathustra* secretly at school. One of the girls got a copy from Germany. Do you remember what Zarathustra says: "Verily, ye could wear no better masks, ye present-day men, than your own faces. Who could recognise you?"'

'I hope that's not meant to be personal,' he laughed, gazing at the girl's beautiful countenance and great, luminous eyes.

'You may take it as you like,' she declared with a delightfully mischievous smile. 'I only quoted it to show you that I have read Nietzsche, and recollect his many truths.'

'You certainly do seem to have a gay house-party at Glencardine,' he remarked, changing the subject. 'I noticed Jimmy Flockart there as usual.'

'Yes. He's one of mother's greatest friends. She makes good use of him in every way. Up in town they are inseparable, it seems. They knew each other, I believe, when they were boy and girl.'

'So I've heard,' replied the young man thoughtfully, leaning against a big glass case containing a collection of *lares* and *penates*—images of Jupiter, Hercules, Mercury, &c., used as household gods. 'I expected that he would be dancing attendance upon her during the whole of the evening; but, curiously enough, soon after his arrival he suddenly disappeared, and was not seen again until nearly two o'clock.' Then, looking straight in the girl's fathomless eyes, he added, 'Do you know, Gabrielle, I don't like that fellow. Beware of him.'

'Neither do I. But your warning is quite unnecessary, I assure you. He doesn't interest me in the least.'

Walter Murie was silent for a moment, silent as though in doubt. A shadow crossed his well-cut features, but only for a single second. Then he smiled again upon the fair-faced, soft-spoken girl whom he loved so honestly and so well, the woman who was all in all to him. How could he doubt her—she who only a year ago had, out yonder in the park, given him her pledge of affection, and sealed it with her hot, passionate kisses? Remembrance of those sweet caresses still lingered with him. But he doubted her. Yes, he could not conceal from himself certain very ugly facts—facts within his own knowledge. Yet was not his own poignant jealousy misleading him? Was not her refusal to attend the ball perhaps due to some sudden pique or unpleasantness with her giddy stepmother? Was it? He only longed to be able to believe that it might be so. Alas! however, he had discovered the shadow of a strange and disagreeable truth!

(To be continued.)

FRIENDLY SOCIETY FACTS AND FIGURES.

An election agent is said to have remarked in confidence to his candidate, 'If you'll tell me what you want to prove, sir, I'll get you the figures;' and the story has been perversely told with a touch of irony, which is unkind to the agent. Figures are often the best of facts, the only convincing facts. A case in point has been brought to our notice lately in reference to an article on 'An Ideal Friendly Society' which appeared in *Chambers's Journal* in January 1906. It seems that four years before that article was published, the Holloway system of friendly society finance, which the writer of the article described, had been adopted by the United Kingdom Commercial Travellers' Association. Mr James Watmore, of 164 Craiglea Drive, Edinburgh, hon. secretary of the Edinburgh and Leith branch of the society, writes: 'Its progress on the lines described has been remarkable, and testifies in the most practical manner that every statement made in that article regarding the Holloway system is based on fact. Your article did an immense amount of good.' Mr Watmore has forwarded to us a summary of the last balance-sheet of the society, supplemented by figures brought down to date. It may be remembered that the essence of the Holloway principle is this: Up to thirty years of age the member pays one penny per day per share. From thirty onwards the payments increase annually one halfpenny per share in order to meet the member's increasing liability to sickness.

This places all members, young and old, upon a basis of equality, each member paying for his risk of sickness at every age. Every member receives sick-pay in case of need, and the surplus of contributions remaining at the end of each year, after payment of sick-pay and management expenses, is apportioned to the members in the form of bank accounts, accumulating at compound interest. In case of death before the member reaches sixty-five years of age, the whole of his accumulated capital is paid to his relatives; if he lives until he is sixty-five it is paid to the member himself in a lump sum, or, if he prefers it, in the form of an annuity for life. The commercial travellers adopted the system in 1902, and at the end of their first year had six hundred and twenty-six members. Since then they have established fifty-three branches, and now have about two thousand three hundred members, all commercial travellers. Their accumulated fund—that is to say, the aggregate of the sums of money standing to the credit of members in the books of the society—has reached the large total of forty-three thousand pounds, after the payment of about ten thousand pounds in sick-pay during the past six years. The annual appropriation to each member has never fallen below one pound seven shillings and a penny—in 1907 it was one pound eight shillings and sixpence; and there is standing to the credit of members who have belonged to the society from its establishment to 31st December 1907, although they may have received sick-benefit: on one share, £8, 18s. 4d.; two shares, £17, 16s. 11d.; three shares, £26, 15s. 4d.; four shares, £35, 13s. 10d.; five shares, £44, 12s. 3d.; six shares, £53, 10s. 10d. A large proportion of the society's fund has been advanced to members by way of mortgage for the purchase of their houses. It should be pointed out that the members of the Commercial Travellers' Association are able to pay a higher rate of contribution than the ordinary members of a friendly society; hence the large accumulations of members holding from two to six shares. But this only illustrates the elasticity of the Holloway system, and its adaptability to the means and needs of thrifty men in varying conditions of life. The system is the essence of simplicity, and the experience of the commercial travellers—all of them shrewd business men—is one more proof of its financial soundness.

THE INVISIBLE MARQUIS OF GALLANTREVE.

CHAPTER IV.

SHE led him through corridors, up the stairs, and into the long portrait-gallery; made him stand at a certain point she indicated; then, crossing the floor, turned her profile to him. Above her head hung a beautiful portrait of a lady who had lived in the time of Henri IV.

'There!' cried the girl. 'Do you not see a likeness between us?'

'Yes, mademoiselle, a likeness very flattering to the original of that portrait.'

'Oh, monsieur,' she cried in child-like glee, 'you are pleased to compliment me! That is very nice of you. I am sure that if you had been my *avocat* I should have won my case. But let us keep to business. You say the Marquis will not sell, no matter what I offer?'

'No, mademoiselle.'

'You seem very positive about that.'

'I am, because he has confided completely in me. I know his mind as well as he does himself.'

'Then I have another plan, but I did not wish to propose that unless he refused obstinately to sell. Shall we talk here, monsieur, or go back to the drawing-room?'

'If you will take me, mademoiselle, to whatever room in the château is your own favourite, I should be pleased to see it.'

'Oh, of course; I wish I had thought of that myself. You will come to my boudoir on this floor. Madame Durfer is there, but we will send her away. She is my chaperon, you know; but when I talk business I cannot have her bothering about. You will understand, monsieur, that as well as being the child of the lady my mother, I am also my father's daughter, and he was a great business-man. You must not forget, monsieur, that while I chatter like a young girl with you, I am nevertheless head of one of the largest ironworks and cannon-foundries in France. I am like Fräulein Krupp in Germany. I have often thought of writing to the fräulein, and proposing to her that we two form a combination, and if France and Germany ever threatened war against each other we two girls should say, "No, we won't give you any cannon," and so stop that nonsense.'

Young Armelin laughed. 'An excellent idea!' he said.

'Isn't it?' she asked brightly, as she glided by his side; still, for all her boasting of business acumen, she was but a secluded little girl, newly from the convent, unawakened. 'Yes, Madame Durfer is rather stupid in matters of business, and I never consult with her; but she is an old dear nevertheless, and I don't know what I should do without her. She was selected by the Sisters of the convent I attended to be my companion, and has been with me ever since. Here we are, monsieur—a circular turret room giving views up and down the valley, and along the front of the château.'

'Ah!' he said, with a long breath. This dainty bower was vastly different from the bare room in which he had builded block-houses as a neglected

lad. The girl thought the exclamation was due to his admiration of the scene from the windows.

'Isn't the view splendid?' she cried. 'And yet in your speech to the jury you couldn't have described it better even if you had seen it before.'

The old woman in an easy-chair had risen.

'Madame Durfer, I introduce you to Monsieur Maurice Armelin, the representative of the Marquis de Gallantreve. We are engaged in a business conference regarding the transfer of this property.'

There was unconscious dismissal in the girl's tone, and for the first time Armelin detected a trace of her father. Madame Durfer bowed distantly, gathered up her needlework, and withdrew.

'Now, sit there,' cried the girl, with a sigh of relief, and he sank at her words into a very easy chair facing the west.

She took a similar seat. 'You see, monsieur, I must ask your advice.'

'But I am adviser to the Marquis de Gallantreve,' said the *avocat* with a smile.

She arched her brows. 'Daren't you give advice to any one else, then?'

'Oh yes; the Marquis wouldn't mind. Still, if the problem pertains to the property, it is your own solicitors with whom you should consult. They might resent my interference if they knew of it. They would call it unprofessional.'

'My problem is only remotely connected with the property; it is personal, and not a commission I could readily give to my solicitors. I am well aware, however, of the duty that devolves upon parents or near relatives in dealing with a matter of this kind; but I have no near relatives, so I must act for myself, and I must ask you not to betray my confidence to the Marquis of Gallantreve, which might cause me embarrassment in future. I wish you represented me alone, monsieur!'

'I wish I did,' fervently assented Armelin.

'I suppose it would be unprofessional if I offered you a larger sum than the Marquis can pay?'

'Oh, I don't know. I might shake off the Marquis, and I should be glad of you for a client when this case is settled.'

'I liked you from the first,' she said meditatively, gazing out to the westward. 'When I saw you, when I heard you speak, you seemed serious and trustworthy. I know my father would have liked you; yes, and my mother too,' she added.

'Mademoiselle, if I was untrustworthy before, I should become trustworthy under your commendation. Be quite frank with me, and I shall give you my best advice, Marquis or no Marquis.'

'Having, as I have told you, no near relative, I must, as a business-woman, take this matter in hand. I therefore empower you to approach the Marquis and tell him that my family makes to him a proposal of marriage between us.'

'What is that—what is that?' gasped Maurice Armelin, leaning forward.

The lady turned her serene face from the western window to himself. 'I propose to become the Marquise de Gallantreve, and will settle on my husband a vast fortune.'

'But, the saints preserve us! you've never seen him. You do not love him.'

Again the girl arched her pretty eyebrows and smiled. 'Love!' she said. 'Is it necessary?'

'Well, between man and woman I suppose there is often such a thing as—as—preference? I should not marry a girl I did not love.'

'Would you not? I thought a wife always loved her husband, and a husband his wife?'

'Doubtless that is true; but this man—this man may be a hunchback for all you know.'

'Is he?'

'No, as a matter of fact.'

'But it is our custom. A girl, except among the lower orders, has no choice regarding the man she is to marry. He is chosen by her parents or their representatives, and the man does not care, provided her *dot* is sufficiently large. The amount of my *dot*, monsieur, I shall leave to you. On behalf of the Marquis, monsieur, you cannot hope for a better offer than mine.'

'No, no, I quite perceive that, mademoiselle.'

'Then you will act as intermediary?'

'With pleasure, since it is your wish. I shall communicate by telegraph with the Marquis to-night, and receive his reply to-morrow morning.'

'Oh, thank you, monsieur! Do you think he will accept?'

'He'd be a fool if he didn't.'

'Ah! is that flattery, or is it the money?'

'I wasn't thinking of the money. At what hour may I see you to-morrow?'

'Whenever you receive the telegram, monsieur. I shall be here all day.'

Maurice Armelin rose.

'Must you go?' she asked.

'I think it would be better. I have stopped longer than I meant to.'

'May I offer you a room in the château?'

'Thanks very much, but I have already arranged for quarters at Josslyn's farm.'

'Ah, then you will be well taken care of! Marie Angelique is a famous housekeeper. You should hear her speak of the young Marquis de Gallantreve. I believe, by the way, that she thought the Marquis was in love with her, and I am quite sure she is in love with him. It nearly made me fall in love merely to listen to her.'

'And why should you not, mademoiselle?'

'Oh, my dear adviser, you know very well it would not be proper for a young girl like me to fall in love with any one. That would be most immodest. You must not say shocking things to me, monsieur;' but her smile took the sting from her reproof.

She accompanied him to the door, and exclaimed at the beauty of the automobile. 'Is that the automobile of the Marquis?'

'Yes.'

'How lovely! He must take me out in that—Madame Durfer and me, I mean.'

'I make no doubt he will be delighted.'

'Please write that telegram very carefully, Monsieur Armelin.'

'Be assured I shall do my best.'

'*Au revoir*, monsieur.'

'*Au revoir*, mademoiselle.'

And with that the automobile glided down the avenue, while the mistress of the château stood meditating, grown pensive suddenly. And here, indeed, was an unexampled state of things: the victor in the action at law sorry he had won, the defeated glad she had lost.

Armelin sped past Josslyn's farm without stopping, and ran on to a distant town, where he entered a telegraph-office and sent a despatch to himself, in care of Josslyn's farm; then, making inquiries, he learned who the fashionable tailor of the town was, and drove thither. The tailor received him with obsequious graciousness, flattered that so evidently fashionable an automobile should draw up at his door. Then his professional eye noted the Parisian cut of the chauffeur's livery, and all at once that eye lighted up and his obsequiousness perceptibly increased.

'Ah, monsieur,' he said, 'those should be the colours of the House of Gallantreve.'

'They are.'

'The automobile possibly belongs to the Marquis?'

'It does.'

'Have I, then, the honour of addressing'——

'Sir, you have the honour of addressing Maurice Armelin, *avocat*, of Paris, who happens at the moment to be in a hurry.'

'Will you step inside, sir?'

'I may add that the Marquis has kindly lent me his automobile for a special purpose, which is to obtain a suit of clothes in the shortest possible period of time. The costume is to be one for the country, with special inclination towards boating on a small river. The material is to be of white flannel cut *à l'Anglais*. You understand?'

'Perfectly, monsieur.'

'I shall want everything else to correspond: shoes, stockings, neckties, straw hat, everything; therefore, be so good as to send an assistant, and gather up whatever is necessary at the best shops where they are sold, and bring them here, that I may try them on.'

'Certainly, monsieur.'

'I now submit myself to your discretion for measurement.'

When the measurement was completed Armelin said, 'You will provide a dressing-room ready for me at seven o'clock to-morrow morning?'

'Yes, monsieur.'

'And this costume must be quite completed at ten minutes to seven.'

'Oh monsieur,' protested the tailor, 'that is impossible!'

'Nothing, my dear sir, is impossible, as a man of your age should know by this time. The men will have to work all night; you shall lose sleep in order to superintend. The men will ask double pay. Well, you will give them treble. Your own compensation I leave entirely to yourself. It would be presumption in me to attempt computation of the worth of a man so eminent in his profession as you are.'

The tailor bowed almost to the ground. 'It shall be done, monsieur,' he said.

'Of course. Now, you understand that I wish this apparel to be the very best of its kind, as I am particular about my clothes, and I don't in the least care what I pay for them. Good-afternoon, sir;' and he stepped into the waiting automobile.

The tailor gazed after him. '*Mon dieu!*' he cried, 'that must be the Marquis himself, in spite of his Maurice Armelin. That is the way the Gallantreves lost their money. They never cared what a thing cost!'

The beauty of a good automobile is that it practically abolishes space so far as its owner is concerned. Maurice Armelin had ordered boating flannels at five o'clock, yet sat down to dinner at half-past six at Josslyn's farm, fifty miles away, and between the time of his arrival and the meal he had enjoyed a refreshing swim in the river Rille. All this he could not have done if he had depended on the railway. At eight o'clock next morning he was back at the farm again; no longer the formal, sombrely dressed *avocat* of Paris, but a young man of fashion, arrayed with a careless elegance that might have given hints on costume to Solomon at that period when he was in all his glory.

(*To be continued.*)

THE MONTH: SCIENCE AND ARTS.

A NEW INGENIOUS INCANDESCENT GAS-MANTLE.

THOUGH the invention of the incandescent gas-mantle has considerably popularised and economised gas-lighting systems, the fragility of the mantle is a pronounced defect. This is because cotton constitutes the foundation of the article; and, though continued efforts have been made to strengthen this substance so as to impart longer life and reliability, they have not been successful. Another drawback is that the present mantle steadily and surely depreciates in its lighting efficiency after it has once been raised to incandescence. These drawbacks have at last been removed by the ingenious achievement of another inventor, who has succeeded in producing a mantle which, with ordinary care, is practically indestructible. It is totally different in design and construction from the present mantle, the

principle being based upon the obtaining by fusion at a very high temperature radiant and unchangeable filaments composed of various oxides, which are so fashioned as to possess the appearance of solid glass or porcelain. There is a flat circular crown from which project, in the form of a brush, three rows of rods or needles of from twenty-three to thirty millimètres in length and eight-tenths of a millimètre in thickness. The mantle resembles a brush made of stout bristles; and, although comparatively thin, they are of great strength, and will not readily break when placed between the thumb and finger. The mantle is placed over the Bunsen gas-flame in the usual manner by means of a special supporting-rod, and when the filaments become incandescent they shed a brilliant light, the intensity of which varies according to their number and length. This mantle is capable of withstanding extreme differences of temperature, is perfectly rigid, and is unaffected by draughts, winds, or rain. Some idea of its strength may be gathered from the fact that the mantle may be removed when in a perfect state of incandescence, plunged into cold water, and replaced over the flame without sustaining any injury or deterioration in its luminous power. Moreover, any tint of light desired can be obtained, from a cold, brilliant white to shades of yellow or red, or soft shades of pink, merely by the introduction of certain colouring oxides in the manufacture of the filaments. The mantle can also be made up into a wide variety of forms, such as flat, round, star-shaped, flowers, or any other decorative design, and is applicable to any gas-system, whether coal, alcohol, petrol, acetylene, &c., as well as being adaptable to all kinds of portable lamps. It is economical in gas-consumption, and the light is quite as intense as that of the ordinary mantle, or possibly more so. With this mantle, a new weapon is available to gas companies for combating the competition offered by the new metallic filament electric incandescent lamps, one which is especially useful, as the mantle is practically everlasting, and retains its original lighting efficiency to the end.

MUNICIPAL COTTAGE-BATHS.

A new movement in the provision of bath facilities for the poor districts of our large centres is now in progress. The first town to initiate the scheme was Brighton, where a number of old buildings in the slum districts were purchased and fitted up for both sexes. A purely nominal charge is made, and for this the parents can participate in the pleasure of a bath together with their family. The latest city to adopt the idea is Birmingham, though similar establishments have been in operation in Liverpool, Manchester, and one or two other towns, but not quite upon the same lines. As the title implies, the principle is the erection or purchase of existing small houses situated in the poor neighbourhoods, and equipping them with baths. No swimming-bath is attached, but the ordinary slipper or other types are provided. Hot and cold water, together with soap and towels, are available for a humble coin, so that the luxury of a douche is brought within the reach of all. That the development is appreciated is borne out by the success that has attended the enterprises already in service, and it is an enterprise that might be advantageously extended to all our large centres to the welfare of the community in general. It involves but little initial outlay to acquire the necessary buildings or even to construct special establishments, which need be of the most formal description, and to equip them with the necessary fittings. Provided the fees are very low, the popularity of such institutions is assured, and they cannot fail to prove self-supporting.

ICE-MAKING MACHINE FOR DOMESTIC USE.

A French scientist, Professor Audriffen of Paris, realising the difficulties attending the use of ice-making machines in the average home owing to complexity of the mechanism, has evolved a simple apparatus which can be controlled by a member of the household. It resembles the ordinary ice-making plant, but upon a much simpler scale, intricate gearing and pressure-gauges being eliminated. There are two chambers connected by a hollow shaft; one chamber is larger than the other, and through this the shaft extends, carrying at its outer extremity a small pulley by which it is driven. The arrangement is such that as the shaft revolves the drums rotate with it in much the same manner as a churn. On the shaft within the larger drum is mounted a small pump so arranged as to swing freely thereon, and maintained in a vertical position by a lead weight attached to its lower end like a counterweight. The piston of this pump is connected to a crank offset on the shaft, so that when the latter is rotated through the outer pulley the piston moves up and down, being kept vertical by its connection with the weight. In the machines designed for small houses the drums are charged with anhydrous sulphurous acid instead of ammonia. The pump draws the gas from the smaller drum through the hollow shaft, compresses it into a liquid, and discharges it into the larger drum, whence it flows back through a connection to the hollow shaft into the smaller drum, where the liquid evaporates and the gas is once more compressed into a liquid; this cycle of operations being repeated continuously. It will be seen that the entire work is carried out under seal, the drums being hermetically closed, so that no liquid or gas can escape. Pressure-gauges are unnecessary, for the simple reason that when excessive heating occurs the compressor-pump commences to revolve on its shaft, and ceases pumping until the temperature is reduced, when it resumes pumping. Consequently the pump-counterweight acts as a governor controlling the action of the machine. If required, the apparatus can be driven by hand (a crank-handle for which is provided) or

by a small electric motor. The large chamber is half-submerged in a tank of cold water, which absorbs the heat generated in the compressing operation. Liquids which it is desired to keep cool, such as milk, may be stored beneath the false bottom fitted to the tank in which the compression-chamber revolves, and drawn off perfectly cold as desired. The appliance may also be connected up to an ordinary ice-box, in which case a brine-tank is used in which ice slabs are made in metal containers filled with water, which is cooled and finally congealed by the circulation or agitation of the surrounding brine.

EFFECT OF PETROL-FUMES UPON THE HUMAN SYSTEM.

Owing to the more extensive use that is being made of petrol for a variety of purposes, it is urgent that adequate ventilating facilities should be provided to prevent those working in the proximity thereof from suffering any injurious physical effects produced by the fumes. It is well known that a walk through a distillery will promote a certain condition closely akin to intoxication, arising from the respiration of the alcoholic fume-contaminated atmosphere. The same result attends inhalation of petrol fumes. As is well known, this liquid is extremely volatile, and the gas produces a nauseating, enervating feeling which, unless arrested in time, may result in a severe disturbance of the bodily system. Travellers in enclosed motor-vehicles frequently experience these peculiar sensations, especially if the petrol-fumes are strongly in evidence, and they can only be dissipated by recourse to fresh air, assisted by a stimulating drink such as tea or coffee. Even then it is some hours before a complete recovery is effected. In confined places the result may be far more serious, prolonged inhalation of the vitiated atmosphere terminating in collapse and insensibility, from which revival is somewhat difficult. Too much attention, therefore, cannot be devoted to the sufficient circulation of pure fresh air in those areas and buildings where large quantities of the spirit are stored or handled, to counteract the effects of petrol-vapour poisoning.

INGENIOUS WAGE AND COST CALCULATOR.

In these days of high-pressure working the dependence upon the human machine, which is apt to be hesitating, slow, and liable to error, is becoming more and more superseded by rapid, handy, and infallible mechanical appliances. One of the latest and most ingenious of these is a British wage and cost calculator, designed for both office and shop use. It is a small machine, measuring about two feet in length by five inches wide and four and a half inches deep. It can thus be placed in any convenient space, such as on the counter or desk, or even hung on the wall. In appearance it resembles an elongated typewriter, with its two rows of keys and a longitudinal slot above, with a central space, in the centre of which the total number of hours or weight is shown. At either side is a small high-speed wheel which visibly indicates the total of which the money value is required in the central slot. Suppose, for instance, it is desired to ascertain the wages due to a workman. The total working period is fifty-six and three-quarter hours, and his wage is ninepence farthing per hour. The side-wheel is turned, and almost instantaneously fifty-six and three-quarter hours appears on the dial. By pressing the wage-price key—that is, ninepence farthing—the amount due to the workman is immediately shown in the slot above the key—namely, forty-three shillings and ninepence. So simple is the system, and so rapidly does it work, that the task of calculating the wages of the whole of the employés in a huge factory can be accomplished by a boy within a few minutes, it only being necessary to manipulate the machine with the left, and write down the totals on the wage-sheet with the right, hand. At the extreme right is a cancelling key, which cancels the previous calculation made, and returns any depressed keys to the off-position. Should a wrong price-key be depressed, by merely tapping the correct key the erroneous calculation is corrected. For shopkeepers it is pre-eminently adapted, and it will reduce the labours of the staff to insignificance, especially in dealing with broken weights. For instance, suppose a customer purchases five and three-quarter yards of calico at sevenpence three-farthings. Instead of worrying out the total mentally, the assistant merely turns the handle until the measurement five and three-quarter yards appears in the central dial, and depresses the price-key sevenpence three-farthings. Instantly the total, three shillings and eightpence halfpenny, is shown; and, moreover, being in view of the customer, the total can thus be checked. The system is applicable to any shop, trade, or industry, and may be employed for a wide variety of calculating purposes, even where the most complex fractions are involved, with conspicuous facility. It will also be observed that the possibilities of losses over broken weights due to miscalculation are entirely obviated. While such loss in respect to an individual transaction might be insignificant, in the aggregate of the year's trade they constitute quite a formidable item. The application of a calculating system such as this to shops is quite a novel departure, and at the same time one which should meet with wide appreciation.

COMBINED COAL AND GAS COOKING-RANGE.

A novel arrangement which should appeal to the good *hausfrau* is the combined gas and coal-fire cooking-range which has recently been perfected. The oven is fitted with gas-burners such as are ordinarily fitted to gas-stoves, and the simple operation of turning on the gas opens air inlets to the oven to support combustion as well as an outlet for the fumes. By turning off the gas these inlets are closed, and the oven can be used in the ordinary manner with the coal-fire. This stove

solves the problem of cooking in comfort in hot weather when a coal-fire is not requisite, and at the same time provides the facility of the gas-oven without necessitating the acquisition of a special stove, as is now the case, which often occupies valuable space in a small kitchen, as well as being unsightly and an additional source of work.

HANDY FLOOR-BOARD LIFTING-TOOL.

Very often the removal of a floor-board to secure access to a pipe or electric wire beneath proves a troublesome task, especially if the board is swollen, when it proves exceptionally refractory. Invariably a withdrawal under these conditions irretrievably ruins the board, so that it cannot be relaid. Recently, however, a natty little tool has been devised, which, although so small that it can be packed into any tool-bag, will immediately lift the most obstinate board, without recourse to prising, cutting, or levering, noiselessly and with little effort. The tool comprises a cross-piece of metal which spans the board to be raised. This carries two small wood screws, while at either end is another small screw fitted with a foot at the bottom and a small handle at the top similar to a screw-jack. All that it is necessary to do is to place the tool across the board so that the extreme jack-feet secure a purchase on the adjacent board on either side. The inner screws are then driven into the board to be lifted by a screw-hammer to secure a firm purchase. By twisting the two miniature jacks at either end, the bridge of the tool is raised bodily for about two or three inches, lifting the board with it. No damage whatever is done to the board, and two little plugs will finish off the small holes left by the screws. For electrical, gas, and water engineers especially it is a useful, cheap, and labour-saving little appliance.

A BRITISH INDUSTRIAL TRIUMPH.

For years this country has been dependent upon America for typewriters and fountain pens. The late Colonel North attempted to establish typewriter manufacturing in this country; but, although an excellent article was produced, it failed to dispute supremacy with the American machine. A few months ago a similar effort was made to establish works for the manufacture of fountain pens, and in this direction the greatest success has been achieved; the result, in fact, completely surpassing the most sanguine hopes of the promoters of the enterprise, since it was thought that the public had become too firmly wedded to the excellently made and standardised foreign products. But a novelty was introduced—the pen was self-filling; and, furthermore, so many improvements were made in the process of production that the Americans soon found themselves outclassed. These works, which have been frequently extended, and are still undergoing considerable development, are a silent monument to a terrific commercial struggle that is being waged. It is the old, old story of merit and enterprise—those qualities which the cycle and shoe manufacturers displayed when they found the 'cute Yankee carrying the war into their own preserves, and the result of which promises to be repeated in connection with the fountain pen. Few people are aware of the multiplicity of stages through which a fountain pen has to pass before it is ready for use, albeit it looks so simple. In fact, at least sixty processes are requisite from the raw material condition to the finished article. From the sentimental point of view, there are some who will regret the development, since this industrial expansion has necessitated a metamorphosis in Bunhill Fields, the romantic atmosphere of which is rapidly becoming but a memory, as successive links with the past disappear to make room for commodious factory extensions. There is the sole satisfaction that such landmarks are making way for flourishing industries which furnish striking proofs of the fact that once the British working-man is properly guided into the requisite channel, in conjunction with inventive enterprise, he can hold his own with the best the foreigner can produce.

SAFETY RAILWAY-LATCH.

The frequent recurrence of accidents due to carriage-doors flying open while a train is travelling has resulted in greater attention being paid to their security. But the mechanical difficulties of the problem, combined with the regulations of the Government authorities, are so complex as to render it somewhat difficult of solution. The superintendent of one of our leading railway companies, however, has invented a safety-lock, the trials with which would appear to fulfil all requirements. It is of the slam-lock type. While it affords greater security than the ordinary pattern, the door can be opened a few inches and yet be held by the safety-catch. Consequently, should the door suddenly give way, the occupant is not precipitated on to the line; while at the same time, when necessary, the door can be easily opened in transit. For trains conveying children this device should prove eminently suitable.

IMPROVED SAFETY-WINDOW.

An ingenious improvement in window design suitable for both factory and private purposes has been completed. While it offers a ready escape in case of fire, it facilitates cleaning without necessitating leaving the interior of the room. The sashes, in addition to sliding up and down, are pivoted centrally on either side, allowing them to swing outwards, while the pivots themselves also slide similarly, so as to enable both windows to be pushed to the top in a horizontal position out of the way, leaving a clear open space below. A special casing is provided at the foot of the window, into which the bottom sash is lowered, and the upper one is brought down into the position normally occupied by the lower, for cleaning. The window can practically be converted when desired into an open door, and is adapted for the handling of pianos and large furniture which cannot be carried in and out *vid* the

staircase. The sashes can be swung at any angle, thereby providing the maximum of ventilation, which renders the window useful for sanatoria and factories.

SPEED-CONTROLLER FOR MOTOR-VEHICLES.

Of late increased animosity has been displayed towards all types of motor-propelled traffic by certain sections of the public, and urgent demands have been made upon the President of the Local Government Board to compel the adoption of devices for the mechanical control of speed. As that official, from his own engineering experience, is fully aware that any mechanical appliance can be easily tampered with by the unscrupulous, it is doubtful if any legislative relief will be obtained in this direction. That an effective method of achieving this end can be devised, however, the invention of two West of England engineers has demonstrated. There is a centrifugal governor mounted on or driven from one of the rotating shafts behind the gear-box, and its speed of rotation is always in fixed relation to that of the road-wheels. Overdriving is therefore rendered impossible. The device has been tested on a motor-bus and has proved very satisfactory.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor.

THE GUARDING OF A GOD.

PART II.

THE camp was pitched in the plain about a mile from the walls, and in their off-time the soldiers were daily in the city, strolling through the streets and chaffering with the shopkeepers in the bazars, being everywhere received by the people with the utmost cordiality. It was a significant fact, however, that the intercourse between the palace and the camp was confined to one formal call, there being none of the gorgeous banquets and nautch-dances with which the Eastern potentates delight to entertain their guests. Fletcher, however, had been an officer in the regiment before his appointment; and, thanks to his endeavours, the time passed fairly pleasantly, whilst Ramzhan sulked in his palace, longing impatiently for the time when his unwelcome visitors would depart.

One morning the Resident galloped to the colonel's tent with the startling intelligence that a couple of natives, said to belong to the camp, had fallen victims to the god during the night, and that the Rajah wished to have the bodies removed at once.

The colonel's face twitched with anger as the message, much softened by the diplomatic tongue of the Resident, was delivered. 'The treacherous scoundrel!' he muttered; 'if any harm happens to an English soldier I will batter his palace about his ears.'

Fletcher's face grew grave at the colonel's wrath. 'Hush, Kennedy!' he whispered; 'we can't blame the Rajah for this, and it might have been worse. Did not Carleton mention the warning I gave him about the idol?'

'Yes,' returned the other; 'and I issued orders that the troops must be confined to their quarters between sunset and sunrise; but you know how difficult it is to keep those camp-wallahs under control.'

Fletcher nodded. 'Where is Butler?' he asked.

'He went down to Amahabad a few days ago on some business connected with his paper, and told me not to expect him back for some time. I suppose I had better view the bodies,' he continued, 'in case of further developments.'

Preceded by the colonel, Fletcher, the doctor, and Carleton, a squad of bearers carrying a couple of stretchers made their way to the temple. The sudden cessation of chatter as they passed the bazars and the flashing of eyes from behind the latticed windows showed that the object of their march was already known, and as they approached the temple it was with difficulty that they made their way through the crowded streets. With a firm step the men entered the compound, and the commander of the Rajah's bodyguard immediately led them into the temple; Fletcher brushing aside the withered brown paw of a filthy mendicant as he entered.

The building was thronged from end to end with curious devotees, drawn there by the rumour that had flown through the city; but the bodyguard quickly cleared a path for the Europeans. The bodies were lying on the steps of the platform, where the mysterious fate had overtaken them; and, at a sign from Kennedy, the doctor dropped on his knees to examine them. At least twenty priests were prostrated in front of the idol, apparently oblivious of the presence of the Europeans; and, above all, the calm face of the god looked benevolently on the white man and the brown, the great ruby glowing with lambent flashes of radiance which were reflected from thousands of curious eyes.

Boyd's examination concluded, the bodies were placed on the stretchers, and, headed by the colonel, the procession made its way to the door, amidst a silence broken only by the solemn intonation of the priests as they sang the praises of the great Siva.

'This is a bad business,' whispered Carleton to Boyd as the grim cortège passed slowly through the streets. 'There is a good deal of grumbling in the regiment because the troops have to be in their quarters by sunset; and, although the guards have been doubled, the fate of those poor devils will arouse curiosity and probably lead to cases of breaking camp. I almost wish Kennedy would take it on himself to set a guard round the temple at night.'

'Daren't, me bhoy,' returned the doctor, who was fond of quoting—or rather misquoting—Shakespeare; 'we come to honour Cæsar, not to anger him.'

Next day Fletcher again came to the camp. 'There is something up, Kennedy,' he said hastily. 'I have just had an audience with the Rajah, who expressed his great sorrow that your camp attendants incurred the wrath of the god. He also desired me to inform you that he has made befitting arrangements for your entertainment during the time you honour Guzampore with your presence; and, finally, nearly knocked me off my feet by adding that, as a mark of the respect he has always borne to Her Supreme Mightiness the great British Raj, he has given orders that the temple is to be shut day and night whilst the troops are here. Of course I expressed my overwhelming obligation at this signal proof of his loyalty, and intimated that if the gates were shut at night it would suffice. But no! he replied that they will be shut night and day until you leave.'

The colonel whistled softly. 'Phew!' he said, 'I wonder what card Ramzhan has up his sleeve.'

'That is what is troubling me,' declared Fletcher. 'He is as dangerous as ever; of that I am convinced. It is some new scheme to disturb the peace of mind of the long-suffering Resident.'

. . . . . .

A fortnight slipped by, spent pleasantly by the officers in the enjoyment of hospitality which has rarely been equalled even in that land of lavish entertainment. Magnificent banquets were given in their honour; shooting expeditions were arranged, in which even the rhinoceros, hitherto sacred to the Rajah's rifle, was allowed to be shot by his guests; and, in fact, it seemed as if His Highness, by a display of the most prodigal extravagance, sought to atone for his former neglect.

Nor were the troops forgotten. Immense quantities of provisions were brought to the camp every morning for the use of the soldiers; and as, despite the growing turbulence of the mob, the temple still remained shut night and day, the Resident, uneasily wondering at the sudden *volte-face*, used every endeavour to get to the bottom of the mystery, but without success.

'It is worrying me into fiddle-strings,' he exclaimed to Carleton. 'I know Ramzhan is meditating some mischief, but what it is I can't find out.'

Carleton nodded gravely. 'Yes,' he said, 'it is very strange. I wish Butler were back! If anybody could get to the bottom of the mystery it is he.'

A few mornings later Fletcher called at the camp with a look of the most extraordinary perplexity on his bronzed face, and made his way to the colonel's tent, where he found the object of his search chatting with Carleton and Butler. The latter's eyes gleamed with amusement as the Resident involuntarily frowned on perceiving him. Special correspondents, as a rule, are not good confidants where State secrets are concerned, and the representative of *The Eastern Age*, knowing what was to come, thoroughly appreciated the situation.

'Like me to go, Fletcher?' he asked. 'I see you have something to tell the colonel.'

'Well, no,' he replied hesitatingly, 'if your promise to keep a secret still holds good.'

Butler nodded, biting his lips to conceal a smile.

'You know,' continued Fletcher, turning to the colonel, 'that I have been wondering why Ramzhan has lately shown such good intentions towards us. Well, Kennedy, I had an audience of His Highness last evening, and the murder is out.' He paused for a moment. 'His Highness Ramzhan ed Din, Rajah of Guzampore,' he continued, 'is the most cowed man within the borders of Hindustan at the present moment. For the first time he showed himself in his true colours; and, stripped of the mask of treachery and deceit, he, metaphorically speaking, grovelled at my feet for mercy. Fearing for his kingdom—ay! for his very life—he handed me the most absolute guarantees for his future good behaviour, witnessed by no less a personage than Azim Ullah, the high priest, and insisted that I should despatch them then and there by a special envoy to Calcutta. And you will never guess why!'

The officers had risen to their feet, staring at him in speechless amazement; whilst Butler, with lowered lids, carefully scanned the tips of his riding-boots.

'Colonel, "The Life of the God" is missing from the idol, and the Rajah's superstitious fears make him see in this a symbol of displeasure on the part of the god. It disappeared on the night after your camp attendants were killed, and in the outstretched hand of the god was found a scroll bearing the words, "Give honour unto thy guests." So much the Rajah let slip in his fright before the old high priest intervened, and this of course accounts for the entertainments he has provided; but where the ruby has gone, and why he gave me the guarantees, remain total mysteries.'

The quiet voice of the special correspondent broke the astonished silence that followed the Resident's statement. 'Not quite, Fletcher,' he said. 'Yesterday morning another scroll was found in the idol's outstretched hand, with the command: "Make Peace with the Unbeliever, that the Faithful may adore."'

The listeners wheeled round in astonishment,

staring at the speaker with faces in which amazement and incredulity struggled for mastery.

So intensely surprised was the Resident, indeed, that for the moment the polished speech of the courtier forsook his tongue. 'Well, I'm ——,' he said.

Butler permitted himself a smile. 'Sit down,' he said, 'and have a peg of the regiment's whisky whilst I tell you a curious story about "The Guarding of a God."

'You fellows are not aware,' he began, 'that many years ago, before the temptation of a big salary induced me to join the staff of *The Eastern Age*, I served a long apprenticeship in the Secret Service. My type of face'—touching his rather prominent cheek-bones—'readily lends itself to disguise; and, having a smattering of a good many languages, I can usually simulate any native character. It was when making some inquiries in a *suttee* case in Mysore that I was able to render some good offices to an old Brahman anchorite who had been grievously maltreated by some Mohammedan fanatics. I had, fortunately, assumed the sacrificial cord on this occasion, and, from my knowledge of native customs, had no difficulty in imposing myself on Ghotai as a worthy devotee. I remained a month with the old man, nursing him back to life, and he showed his gratitude by initiating me into the mysteries and telling me many of the secrets of the higher priesthood.

'As you know, the Brahmans have made extraordinary strides in the science of botany, and more particularly in the properties, medicinal and otherwise, of plants and flowers; and, amongst other weird secrets, Ghotai showed me a specimen of the mysterious Blossom of Death, the aroma of which is immediately fatal, and leaves no trace of its effects on the victim. He also gave me the antidote, certain essences with which plugs of cotton-wool are impregnated, to be stuffed up the nostrils when the plant is being handled.

'On the morning that I went to the temple I thought I recognised the peculiar aromatic smell, and contrived, by dropping some money, to look up at a Brahman's nostrils, observing that they were plugged. I also noticed faint circular marks on the steps of the altar, such as are made by flower-pots, and my suspicions became certainties when I saw that the canopy over the idol was nothing more nor less than a shaft to carry off the poisoned air of the temple.

'My first task was to find out if the troops were really in danger; and, by Jove, Fletcher! your suspicions were justified. I discovered that Azim Ullah, with the object of adding to the idol's already great reputation, had hatched a scheme to entice the men into the temple at night. Once inside, of course there was no hope for them.

'My observations and the preparation of the essences took a considerable time; and, in fact, my plans were only perfected on the morning when you came to the temple. By the way, Fletcher, you might have spared a pice for the poor old fakir at the door.'

The Resident started. 'Was that you?' he asked incredulously.

Butler nodded. 'The same evening,' he continued, 'when the devotees were leaving the building, I contrived to slip into a recess, and waited quietly until the voice of a priest, warning the people that the god was at peace, resounded from the gate.

'An hour passed by, and then what I had looked for happened. A door at the side of the altar opened, and a procession of white-robed priests, their faces carefully swathed in bands of cloth, filed into the temple, each carrying a pot in which was growing the extraordinary plant that I have described.

'In absolute silence, the deadly guard was placed round the steps of the platform; one by one the priests prostrated themselves in front of the shrine, and silently filed out again, leaving me alone with that magnificent ruby, glowing with a rosy blush in the light of the sacred lamp.'

Butler paused, enjoying the stupefaction depicted on his listeners' faces.

'But the second scroll?' gasped the Resident when at last he recovered his speech.

'Have I not told you that old Ghotai initiated me into the rites of the priesthood. Even in their confusion over the disappearance of the jewel, the Brahmans made welcome Jhal Saiz, the holy man from Benares; and, once inside the monastery, the rest was easy.'

. . . . . .

The same night a wizened old fakir might have been seen crawling on hands and knees towards the Brahmans' quarters; and when, on the following day, the gates of the temple were once more thrown open to the enormous crowd, 'The Life of the God' returned the adoring gaze of the worshippers with beams of crimson splendour.

I WONDER?

I WONDER if the damask roses blow
In one dear garden of 'The Long Ago'?
And if the pansies' wistful faces hold
The tender mystery that they did of old?

I wonder if the jasmine stars to-day
Along the hedgerow make a 'milky way'?
And if the little bed of sturdy thyme
Cradles its bees, with their low, lulling rhyme?

I wonder if the fountain's silver plumes
Still curve above the stately lily-blooms?
I wonder if the blackbird still doth break
The garden's hush for love, and love's sweet sake?

. . . . . .

Oh, rose of yesteryear! oh, last year's nest!
We may not hold the things we love the best.
I *wonder*, *wonder*—yet the while I *know*
'Twas only Youth that made 'The Long Ago.'

THE LUCK O' THE SPEY.

By Sheriffs Clarke.

IN FOUR CHAPTERS.—CHAPTER I.

ON a spring day a hundred years ago a man lay hidden in the heather on Speyside, his blue eyes fixed on the hillside across the lithe, gleaming river. He was a tall man of about thirty, finely built, with the lean flank and build of a hillman, a handsome head, straight nose, and eyes blue as the cornflower so often seen in the Scottish Highlands. He wore a kilt of the Grant tartan, and in his glengarry was a sprig of fir, the badge of his clan. His collie, Cù Math, lay beside him, concentrating the gaze of his brown eyes on nothing in particular, as only a dog can. The man kept quite still, his head in his hands, watching.

The day was clear and windless. The hill-tops and the pines were picked out against the sky in the crisp air, the sun shining with the rare and intense decision of a perfect spring day in the north. Far up the strath the river gleamed, a claymore in the brown moorland. A hundred feet below where the Highlander lay it passed singing to the gray North Sea at Garmouth, three miles down-stream. Plovers bickered over the lea. On the uplands a ploughman whistled behind his easy-swinging team, impudent gulls following him, their wings twinkling gray against the brown of the turned furrows. A stately brigade of pines lined the hillside, their crests tremulous against a hundred little clouds. From the earth and the air came the subtle sounds and signs of spring and youth and joy. And the man watched, evil in his heart, for two men loved one woman.

On the slope of the hill opposite to him a curl of peat-smoke marked a moorland cottage, and at the gate of its little garden stood the woman. The man in the heather watched her. Until last month, his Mary! Until last month, when the 'floaters' brought down the river from Badenoch the little, slight Lowlander, Watty Douglas. Until then, his Mary!

The Celt thought of her as his heart, his white love, his Spey pearl, the flower o' the strath, her eyes like the cairngorms of her own hills, her laughter a peal of merry bells. Then the accursed Sassenach came, with his songs, his wheedling voice, and his nimble tongue, and Mary's smiles were all for him. He, Alasdair Grant, son of the mountains and the Spey, was supplanted by a stranger—nay, worse, a Lowlander, a sapling whom he could break across his knee. The blood surged at his heart and he buried his face in his hands, for he was a Celt and a hillman, with a dreamer's sensitive blood and the traditions of his race, vain, highly strung, courageous. He could face the Spey in flood, or the cutlasses of the revenue cutter, but a thoughtless village jilt sent his senses quivering. There he lay watching, watching—fury in his heart.

The slight, girlish figure moved down the path. Alasdair winced. There he was, the Black Curse on him! A little, fair man sprang lightly up the slope, and reappeared among the trees at her side. Alasdair could see the welcome in her eyes. A half-sense of shame seized him as he lay hidden, but chains of jealousy and self-torture held him to his hiding-place. The girl's head was on Douglas's shoulder, her arms round him, his kisses on her mouth, her hair, her neck. Somewhere in the forest an early thrush burst into a mellow thanksgiving for life. The lovers listened, hand in hand. The Spey sang louder.

The man in the heather crept silently farther out of sight, until he reached a sheep-track in the brown moorland. Then he walked with white, set face, covering the five miles between him and his home in an hour, and came out on the right bank of the Spey near its mouth, opposite where a little, town lay, its whitewashed houses and the masts and yards of the clusters of ships in the harbour a pleasant picture in the bright sunshine. Across the river floated the hum of the town and the

[*All Rights Reserved.*]

shouts of workmen. The steady boom of the surf sounded clear in the still air.

Alasdair went down to the water's edge and unmoored a skiff. Three strong strokes took him out to mid-stream. He pulled up-stream for a stroke or two, shipped the oars, and then, stepping to the bow, drew his skean-dhu—the little, black knife of the Gael—from his right leg. The knife gleamed bright in the sun as he leaned over the thwart. He dipped the blade three times in the running water, bared his head, and, kneeling, made the sign of the cross. Then he repeated twice, in the Gaelic, the words:

'The Spey from the mountains knows the hearts of the Grants,
In our cradles she sang us to sleep.
Many are our years and claymores she remembers,
Round our graveyards softly she wails.
Keep my heart's secret, my hands from red blood,
Oh proud, singing river!'

He stood up, his face calmer, replaced the skean-dhu, and slowly pulled towards the harbour.

'Ah, Alasdair,' said a 'floater' as the skiff was being moored, 'the revenue men were far east last nicht, an' the free-traders got in as easily as whustlin' a tune. Come awa' to "The Norway Lass" an' we 'll drink.'

'That I will,' answered Alasdair, and the two men sauntered through the street to the sign of 'The Norway Lass.'

'If it 's a fair question, Alasdair, what micht ye ha' been doin' oot in mid-stream?' asked the 'floater,' over the glass.

The Highlander's blue eyes smiled, for his questioner was a good-natured Morayshire gossip.

'Maybe, Jock o' the Lugs, that I was saying my prayers,' said he. 'Maybe I was not. But I was minding my own business.'

CHAPTER II.

TWO or three sounds are faithful to the little town on old Speyside: the river's voice over the shingle, the halloo of the gale straight from the awful silences of the frozen North, the bass, plangent note of the eternal surf still clamour round the ghost of the old place. But on the day, long ago, when Alasdair and Jock o' the Lugs met, many heartening sounds arose from a harbour full of masts. Derricks clattered. A hundred strident mallets called to one another, for in those far-off days Garmouth was the centre of a now dead and gone industry—the building of wooden ships; but the 'Spey clippers,' once famous wherever the red ensign flew, now sail on phantom seas, along with the 'seventy-fours,' the stately East Indiamen, and the old-timers of Marryat.

Alasdair and his comrades belonged to the vanished band of Spey 'floaters.' From Rothiemurchus or Glenmore, from far green Highland forests, huge rafts, piled up with pine, fir, and larch, were floated down Spey to the river's mouth, manned and steered by the 'floaters.' It was difficult and dangerous work, for a Spey spate meant a sudden, sullen flood, the image of Death, silent, rapid, relentless. The 'floaters' were a bronzed lot, hard-worked, and earning good wages. Between spells they were jovial and free-living, for French brandy was cheap. Smuggling and deer-poaching were venial peccadillos, and many an anker of brandy was 'run' among the sand-dunes of the coast, many a gallon of pot-still brought over the hills from Glenlivet, without having paid His Gracious Majesty King George the Third any vexatious dues.

The Norway Lass Inn stood snugly tucked in the elbow of the narrow, bent street, a pleasant retreat in summer days for a cool tankard in the old-fashioned Scots garden; in the chill, sea-stung evenings the heartening blaze of its peat-fire in the big open hearth beckoning a welcome. On the sign was painted a square-rigged schooner in full sail, against a middle distance of aggressively large green waves and a sky of slate. She was apparently undermanned, for the crew consisted of one damsel whose long fair hair flew loose in the wind. The colours had run woefully, with a disconcerting effect, for one eye was a pensive blue and the other a truculent and impossible purple. No one knew what the sign meant or who the 'Lass' was. It may have been a relic of old times, when the Raven's flags or the Maid of Norway came over the sea, or perhaps it was only the whim of some soft-hearted sailor who had brought a fair wife from Norway or left his thoughts there. Who knows? There it had swung past memory.

Inside, in the kitchen, where Alasdair and the other 'floater' were seated, a wide open hearth held the glow of peats and hissing pine-cones. The room was long and low-roofed, with blackened rafters hung round with sides of bacon or kippered salmon waiting their turn to 'skirl' in the pan. A double row of shining plates lined the dark walls like the gleam of white teeth in an honest brown face.

The room was full. There were Highland 'floaters' from Strathspey or Upper Badenoch or far Lochaber, a Yorkshireman or two from the Kingston Shipbuilding Company, douce trading burghers from Elgin, a Spanish sailor gambling with a fat Dutchman who had just 'made' the harbour in an innocent-looking fishing-lugger—he had sunk his rich 'crop' of French brandy along the coast before the dawn. In a corner two or three tarry sailors, flushed with brandy, were singing snatches of the old East Lothian smuggling refrain:

Rin down the wynd, Willie Crunk!
Flee quick this night, John Arnit!
The Dutchman's lights are showing,
Just arrived direct from Flushing.
The coast is clear, get out the ankers,
And cheat the curst preventive jankers!

Alasdair rose to call for more brandy.

'Alasdair Grant! Alasdair, a song!' shouted a fat Elgin trader. 'You'll be gaun' up Spey the nicht, an' we'll no' see ye for a week. A song!'

'And indeed it is Alasdair that is the best singer in Strathspey, or in all the north,' said a Highlander.

'The young man Douglas sings very weel, though —very weel,' said the Elgin man.

'But it is the impudent tongue he has,' said the Highlander, loyal to his clansman.—'You will sing, Alasdair?'

Alasdair shook his head. 'I will not have the voice or the heart this day,' he said half to himself.

'Speak o' the de'il,' said another. 'Here is Douglas.'

The men turned and saw Watty Douglas, who had been standing unseen, listening.

'Good-evenin' to ye all, impudent tongue in me or no',' said he. 'Do ye want a song, even if it be a Lowlander's?'

Alasdair said nothing, but flushed dark as he heard the pleasant, clear voice, and ran his eyes over the Lowlander's slight figure.

'What is that you say, Walter Douglas?' said Ian from Rothiemurchus. 'Perhaps you can sing, but there are no Sassenach songs to compare with the songs of the hills and rivers of the glens.'

'That's jist a wheen Hieland blethers owre a dram,' retorted Watty coolly. 'Ye always say that, an' because ye dinna ken ony better. Ye've never been ayont the Strath.' He pronounced it 'Stra-ass,' in exaggerated mockery of their Highland accent. 'An' ye speak o' the Spey as if there was no river in the world like it.'

Alasdair sprang to his feet.

'And neither there is to a Grant. What can a nameless youth from the Lowlands know of our Spey? The river has taught our bards for hundreds of years, and the winds through the pines and over the dark lochs sing songs that no one but a Gael can hear, far less sing. As for the Sassenach'——

'Oh, Sassenach here, Sassenach there!' broke in the other. 'I'm fair sick o' the word. An' as for bein' nameless, let me tell you that the name o' Douglas was kent lang before Grant. I'm no' sayin' that the Grants are na as guid men in the field as their neebors, an' maybe afore them in snappin' speerits; but they fill their heids wi' havers about the winds an' the ghosts an' the hills an' the trees as if God's earth belonged to them an' the Gaels. An' as for their bards, I suppose ye'll never ha'e heard o' a chiel Robbie Burns, that dee'd jist the other day?'

The Highlanders sulked ominously, and Douglas smiled.

'I thocht as muckle. Man, Burns's sangs are worth a' your Hieland bards, as ye ca' them, put thegither! He never fashed wi' the sea an' the lochs an' sic like, but he aye went straught to fowk's hearts.' He laughed contemptuously.

'It's a wonder nane o' ye got up wi' the lee in your Hielan' throats and said ye kent a' aboot him.'

'What do ye mean, Lowland dog?' cried Alasdair, starting up, his voice trembling, the Highlanders instinctively gathering round him.

'Dog to yoursel'! Plain what I said, an' fine ye ken what I mean. Everybody kens to keep their sporrans steekit in the Hielan's an' believe nae-body west o' the Findhorn,' answered Douglas. 'They're a' sic leears that ye canna believe even the opposite o' what they say.'

The Highlanders' knives were drawn. The others clustered round the Lowlander, and for an instant a fight hovered in the air.

'Shame on ye all! Shame on ye! to let a drop o' French brandy send the wits to the skean-dhu!' An old woman stepped into the middle of the room, speaking rapidly to the Highlanders in the Gaelic.

'It is old Morag,' said one of the 'floaters.'—'What is it, mother?'

The old woman continued her high-pitched sentences in the Gaelic, until the Highlanders, led by Alasdair, sheathed their little black knives.

'Peace it is.' She turned to the others. 'See to it!—And you,' she turned again to the Highlanders —'you drew the skean-dhu in a poor quarrel in an alehouse, and would be fighting like butchers' dogs. You will be doing your duty to the Grants and Speyside by sending round the Candlemas-cup.'

'Weel said,' observed the peace-loving Elgin man in the corner, his head over his fourth tankard. 'I'm a man a' for the comforts o' life, an' nane o' the contentions like;' and his treble chin wagged assent.

Alasdair came forward and took off his glengarry. 'It is wrong we were, my clansmen and I, to draw this night. The blood was hot, but we were wrong, as Morag has told us, and we will have peace and the Candlemas-cup.—Hasten with it, lassie!'

The staring serving-wench disappeared, and came back with a huge steaming bowl filled with brandy-punch. Roasted apples floated in it, and two sprigs of fir, the badge of the Grants, were crossed over it.

The bowl was placed on the table in the middle of the room, old Morag standing beside it. Taking up the sprigs, she placed them in the form of a cross before the blazing hearth, and then chanted in the Gaelic:

> 'The Luck o' the Spey to the fighting Grants,
> Save to them who strike for a worthless cause.
> Stand fast, Craigellachie!'

A steaming tumbler was served out to all.

'The Sassenach will sing now one of the songs of this Burns he spoke of,' she said; 'for, if we quarrel on Candlemas Eve, black, black will be the year!'

A chorus of assent rose to the rafters, and Watty Douglas stood up and began to sing:

'Oh Mary, at thy window be,
It is the wished, the trysted hour.'

He had a rare tenor voice, full and resonant, and sang as naturally as a mavis. It was a curious scene. The motley audience listened to the rich, pure notes and the words, then new to the far north, in a tense silence. Douglas was in his own way an artist, and an artist singing to his lady-love. The simple words and the cadence of the air wrought like magic. The commonplace room took on new lights and shadows, as to each man the spell of the song brought forgotten visions — to some indefinable yearnings long forgotten, the land of dead dreams and well-nigh dead hopes, the march of wasted years, lost youth and innocence; to others it sang of present days, of high courage, of companionship, of sweet, sunlit ambitions, of bright eyes, calling up to all strange stirrings of the heart. They sought each other's eyes, half-ashamed, as men are, of their best instincts, and the rough crowd, five minutes before on the brink of blood, was transformed and humanised. Music is the greatest of all levellers, except one.

When the singer finished, the audience drew a long breath of delight, all except Alasdair, for his rival, intentionally or not, had chosen a song that sent his jealous nerves jangling.

One of the Grants came forward and took Douglas by the hand.

'It is the great pity that you are not a Highlander,' he said simply. He could think of no higher praise.

Song followed song, until the February moon was climbing the dark, mysterious woods.

'One song more, and from Alasdair,' said one, as Alasdair rose to go.

'No,' said Alasdair, and he went out into the quiet night. 'I cannot sing this day.'

The others gradually left in twos and threes, leaving only old Morag and a few of the more drouthy sailors and 'floaters.'

'Morag,' said Jock o' the Lugs, 'I saw Alasdair to-day in his boat in mid-Spey. He drew his skean-dhu and made the good sign. Then he washed the blade in the water. What could he have been after?'

'John of the Long Ears,' said Morag, 'you are like the blackbird, the busybody of the woods, always calling other folk's business. It was the Luck o' the Spey he would be asking, and it is this: If a Grant feels the call of the Evil One or of hatred or blood, he will go to mid-stream in the Spey, for the Spey is our mother, and he will do what you saw, saying a charm that only the Grants know. But the Spey will bring no luck, but will be an enemy, to any Grant who draws for a worthless man or woman. Listen!' She pointed out of the window to the moonlight on the mail-clad river. 'Listen! I can hear what the river says! Some of you laugh; but you do not laugh when your sheep go astray, or when you miss any peats from the stack. Then you come with fair speech to old Morag. I am an old woman, and you are young and no doubt clever men; but there are things on Strathspey that you or any one who has not the blood of the Grants never will understand, and one of them is the Luck o' the Spey.'

(To be continued.)

WILFUL WASTE.

SEEMINGLY, having passed safely through the various ages named by Hesiod, the United Kingdom has embarked upon a new period which future generations will describe as the 'waste age.'

It is rather difficult to get away from the subject of waste in this country. Waste is apparently rampant. Royal Commissions regard the wastage with dismay, and turn out reports that are in themselves provocative of waste of time.

Although most people, if put to it, can manage to waste after a fashion, to waste artistically is given to but few. Not many years ago, for example, a Berlin wine-merchant was found guilty of adulterating his wares. Justice rose up in her wrath, and through her police seized three thousand two hundred and fifty gallons of liquor, which were emptied into the gutter. Justice was then satisfied, but it is doubtful if any one else was. Indeed, from the common-sense point of view, Justice, by her inartistic and wilful waste, appears to have been as morally guilty as the dishonest wine-merchant. Such waste is quite indefensible.

In 1904 ten million cigars were consumed in a fire which broke out in a tobacco factory at Budapest. It would be rash to assume from the bare statement, and without particulars concerning the quality of the cigars, that the conflagration represented a form of waste, for it may have been a blessing in disguise; but the incident recalls a fact that is *à propos* of inartistic governmental methods of wasting—namely, that there was a time when confiscated tobacco was burned in a kiln, at the London Docks, which was called the Queen's Pipe. We have, however, altered all that, and to-day the smugglers' booty, to the value of eight thousand pounds per annum, is used at various public gardens for fumigating purposes, while the criminal lunatics at Broadmoor act as human kilns in respect to a fair proportion.

When, early in 1904, the Japanese squadron bombarded Vladivostock for fifty-five minutes, at a cost of twenty thousand pounds, with tangible

results represented by the three letters *nil*, the money was not altogether wasted, because of the moral effect that the bombardment had upon the inhabitants of the city; but when, through carelessness, a workman at the Smirnoff Distillery in Moscow, some six or seven years ago, emptied into the sewers the contents of a tank containing rectified spirit on which seven thousand pounds excise had been paid, temperance advocates and excise officials could alone derive any satisfaction from the occurrence.

To waste thoroughly and artistically is not given to all public bodies. Most of them can waste with wonderful thoroughness, but the artistic element is noticeable chiefly by its absence. For instance, some little time ago a cold-meat depôt was apparently required at Gibraltar. An ordinary man having such a requirement, and the wherewithal to satisfy it, would have built a cold meat depôt straight away, and been done with it. A Government official, however, works on different lines; he wanted a cold-meat depôt, so he built an ammunition-store at a cost of forty-two thousand pounds, and spent a further forty-seven thousand pounds in converting it into a cold-meat depôt. It is not every one who would have thought of such an admirable method of wasting money; but the Admiralty officials did their best to rival the effort when they built at the naval barracks at Chatham a magnificent apartment, to whose door was affixed a brass plate of great effulgence betokening that the room was to be used for the purpose of the 'Court-Martial.' When, in due course, it transpired that the naval regulations held that courts-martial must be conducted on the water, doubtless the brass plate was removed. Presence of mind, of course, is a characteristic national attribute.

In 1901, when two of the forts commanding Sandown Bay were remodelled and rearmed, two twelve-year-old eighteen-ton muzzle-loading guns gave place to modern twenty-five-ton breech-loaders, much to the satisfaction, doubtless, of the inhabitants whose property they defended. But the question arose, 'What is to be done with the effete ordnance superseded?' The ordinary man, with a mind trammelled by the conventions of commerce, would have cast round for some means whereby the many tons of steel contained in the guns could have been turned into coin of the realm for the relief of the indigent taxpayer; but the official mind seemingly recks not of economy, and the armament in question was dragged out of the fort, deposited on a piece of land outside, and buried beneath the débris caused by the excavation. However much he may regret this instance of official waste, the British taxpayer, mindful of the burden of war-taxes placed upon him in the not remote past, will most fervently remark, in respect to the buried treasure, '*Requiescat in pace!*'

That it is a rather dangerous practice to indulge in wilful waste is now in all probability realised by those cotton-planters of the United States who, in December 1904, indulged in bonfires of the staple commodity of the Southern States with a view to keeping up the prices. Some years ago the cotton-harvest was superabundant, but more recent crops have been as short of the world's requirements as that of 1904 was in excess of the demand; and although the farmers' threat to burn two million bales was in all probability never carried out in its entirety, the fact that one day alone saw twenty thousand pounds' worth of cotton burned proves that the amount wasted, which would have brought a good round sum, was not inconsiderable. Object-lessons in economics have, doubtless, a value of their own; but when the lesson performs a boomerang-like evolution and unexpectedly assaults the tutor, it is not unlikely to lose much of its popularity.

The amount of liquid that has been allowed to run to waste of late has been enormous. An ardent Rechabite and ex-senator for Missouri some little time ago descended to his wine-cellar with a number of other Rechabites, and cracked, not merely a bottle, but every bottle contained therein. This included a supply of Napoleon brandy, dozens of old burgundy and champagne, and other wines, that might have been put to a useful purpose at a hospital instead of being turned into the drains. Nearer home, six thousand gallons of beer were recently destroyed near Spalding when it was found that it had been brewed with water impregnated with salt, through the river Welland contaminating the river Glen in that respect; while not many months ago the emptying of a great reservoir in which a man had committed suicide entailed the wastage of over three thousand pounds' worth of water. When, some little time since, two barrels containing seventy-two gallons of beer fell from a dray and burst, the workmen employed on the Strand improvement scheme went to extraordinary lengths in order to prevent wastage, some men even sacrificing the cold tea in their cans, which they refilled at the flowing streams in order to save the malted liquor. At Grimsby, too, early in 1905, when a hogshead of port fell and burst, and the gutters ran red with fifty guineas' worth of wine, crowds armed with bottles, mugs, and cans worked with exemplary industry to prevent undue waste; but this enthusiasm is far from being general. Indeed, when fifty million gallons of water were allowed to run to waste from a London reservoir in the autumn of 1904, and by the bursting of a main at Scarborough about the same time over five hundred thousand gallons of liquid were wasted at that pleasure-resort, it is believed that not so much fluid was salved in either case as would suffice to bring about the obsequies of a kitten. The public is strangely apathetic at times, while at others it is exactly the reverse; indeed, the bursting of the huge vats of the Loch Katrine Distillery in 1906, when two hundred thousand gallons of whisky were lost, is understood to have plunged a whole country-side in gloom.

Some time ago the proprietor of a Newcastle hotel woke one morning to the fact that the buffet of his establishment was a lake of liquor. During the night two men had broken into the building, and had seemingly employed their time in turning on every tap in sight, with the result that these strenuous advocates of temperance succeeded in running to waste one thousand two hundred and ten gallons of beer, one hundred and thirty-six gallons of whisky, and one hundred and twenty bottles of various spirits. The feelings of the owner when this heartrending sight met his eyes could not have been more enviable than those of the manager of the Anglo-American Oil Company at Limerick, in 1906, when he discovered that some one had maliciously turned on the taps of the oil-tanks one Saturday night, with the painful corollary that seven thousand gallons of oil were wasted.

But the situation was scarcely so painful as that confronting a certain Mrs Schmidt, of New York, some few years ago. Into the possession of Mrs Schmidt there came a brewery. Some people could put up with any number of similar inflictions, but the new proprietress had no desire to brew. To stop brewing was obviously her best policy, but what was to be done with the stock in hand? The fate of eleven thousand barrels of good fresh beer depended upon the new owner's decision; and in due course eleven thousand barrels gushed out on the cement floors of the brewery, flooded the building, and eventually poured forth into the river, amid the lamentations of a vast crowd who appreciated to the full the unhappy state of one Tantalus on a certain famous occasion. It was a noble sacrifice, and one that but few people could have brought themselves to sanction. Waste it undoubtedly was, but it was a form of waste that brought joy to many thousands of homes—those of temperance advocates and rival brewers. It is to be hoped, therefore, that the heroine of this abnegatory exploit derived all the satisfaction obtainable from the knowledge that it was cheaper to run the beer into the sewers than give a bond of fifteen thousand pounds to the Government of the United States, who would also have claimed a tax on the beer of six hundred pounds had it been removed for the purpose of consumption. Apparent waste is not invariably real waste, notwithstanding the findings of a Royal Commission.

But when the subject of waste is considered, it must not be forgotten that man's efforts in that line, even when a full board of guardians has the task in hand, are puny in comparison to what Nature can do when pressed. Some little time ago Mr J. Brown, F.R.S., when lecturing at Belfast, gave a case in point *à propos* of the abnormal appetites of the two million gulls that frequent our coasts. Each gull, he estimated, during the herring season destroys two hundred fry per day, or twelve thousand during the two months of the season; and he further estimated that if these twenty-four thousand millions of fry were permitted to come to maturity they would be worth twenty-four million pounds, a sum almost sufficient to provide for the long-desired and now in effect old-age pensions. This interesting fact is mentioned here without prejudice to the provisions of the Wild Birds Preservation Act. Doubtless the pro-gullers, if the abolition of a close-time for gulls was seriously suggested, would quote statistics showing that if it were not for the gulls the ocean would become so overstocked with herrings that it would be impossible for the *Mauritanias* of a future generation to carve their courses through the super-herringated waters of the Atlantic. Nature may be wasteful, but she has her own methods, and it is dangerous to meddle with them.

THE HOUSE OF WHISPERS.*

By William Le Queux.

CHAPTER VI.—CONCERNS GABRIELLE'S SECRET.

ALONG the cloister they went to the great hall, where Walter's mother advanced to greet her. Full of regrets at the girl's inability to attend the dance, she handed her the missing bracelet, saying, 'It is such a curious and unusual one, dear, that we wondered to whom it belonged. Brown found it when she was sweeping my boudoir this morning. Take it home to your mother, and suggest that she has a stronger clasp put on it.'

The girl held the golden snake in her open hand. This was the first time she had ever seen it. A fine example of old Italian workmanship, it was made flexible, with its flat head covered with diamonds, and two bright emeralds for the eyes. The mouth could be opened, and within was a small cavity where a photo or any tiny object could be concealed. Where her mother had picked it up she could not tell. But Lady Heyburn was always purchasing quaint odds and ends, and, like most giddy women of her class, was extraordinarily fond of fantastic jewellery and ornaments such as other women did not possess.

Several members of the house-party at Connachan entered and chatted, all being full of the success of the previous night's entertainment. Lady Murie's husband had, it appeared, left that morning for Edinburgh to attend a political committee.

A little later Walter succeeded in getting Gabrielle

* Copyright in the United States of America by the Authors' and Newspapers' Association, New York, 1908.

alone again in a small, well-furnished room leading off the library—a room in which she had passed many happy hours with him before he had gone abroad. He had been in London reading for the Bar, but had spent a good deal of his time up in Perthshire, or at least all he possibly could. At such times they were inseparable; but after he had been 'called'—there being no necessity for him to practise, he being heir to the estates—he had gone to India and Japan 'to broaden his mind,' as his father had explained.

'I wonder, Gabrielle,' he said hesitatingly, holding her hand as they stood at the open window—'I wonder if you will forgive me if I put a question to you. I—I know I ought not to ask it,' he stammered; 'but it is only because I love you so well, dearest, that I ask you to tell me the truth.'

'The truth!' echoed the girl, looking at him with some surprise, though turning just a trifle paler, he thought. 'The truth about what?'

'About that man James Flockart,' was his low, distinct reply.

'About him! Why, my dear Walter,' she laughed, 'whatever do you want to know about him? You know all that I know. We were agreed long ago that he is not a gentleman, weren't we?'

'Yes,' he said. 'Don't you recollect our talk at your house in London two years ago, soon after you came back from school? Do you remember what you then told me?'

She flushed slightly at the recollection. 'I—I ought not to have said that,' she exclaimed hurriedly. 'I was only a girl then, and I—well, I didn't know.'

'What you said has never passed my lips, dearest. Only, I ask you again to-day to tell me honestly and frankly whether your opinion of him has in any way changed. I mean whether you still believe what you then said.'

She was silent for a few moments. Her lips twitched nervously, and her eyes stared blankly out of the window. 'No. I repeat what—I said—then,' she answered in a strange, hoarse voice.

'And only you yourself suspect the truth?'

'You are the only person to whom I have mentioned it, and I have been filled with regret ever since. I had no right to make the allegation, Walter. I should have kept my secret to myself.'

'There was surely no harm in telling me, dearest?' he exclaimed, still holding her hand, and looking fixedly into those clear-blue, fathomless eyes so very dear to him. 'You know too well that I would never betray you.'

'But if he knew—if that man ever knew,' she cried, 'he would avenge himself upon me! I know he would.'

'But what have you to fear, little one?' he asked, surprised at the sudden change in her.

'You know how my mother hates me, how they all detest me—all except dear old dad, who is so terribly helpless, misled, defrauded, and tricked—as he daily is—by those about him.'

'I know, darling,' said the young man. 'I know it all only too well. Trust in me;' and, bending, he kissed her softly upon the lips.

What was the real, the actual truth? he wondered. Was she still his, as she had ever been, or was she playing him false?

Little did the girl dream of the extent of her lover's knowledge of certain facts which she was hiding from the world, vainly believing them to be her own secret. Little did she dream how very near she was to disaster.

Walter Murie had, after a frivolous youth, developed at the age of six-and-twenty into as sound, honest, and upright a young man as could be found beyond the Border. As full of high spirits as of high principles, he was in every way worthy the name of the gallant family whose name he bore, a Murie of Connachan, both for physical strength and scrupulous honesty; while his affection for Gabrielle Heyburn was that deep, all-absorbing devotion which makes men sacrifice themselves for the women they love. He was not very demonstrative. He never wore his heart upon his sleeve, but deep within him was that true affection which caused him to worship her as his idol. To him she was peerless among women, and her beauty was unequalled. Her piquant mischievousness amused him. As a girl, she had always been fond of tantalising him, and did so now. Yet he knew her fine character; how deeply devoted she was to her afflicted father, and how full of discomfort was her dull life, now that she had exchanged her school for the same roof which covered Sir Henry's second wife. Indeed, this latter event was the common talk of all who knew the family. They sighed and pitied poor Sir Henry. It was all very sad, they said; but there their sympathy ended. During Walter's absence abroad something had occurred. What that something was he had not yet determined. Gabrielle was not exactly the same towards him as she used to be. His keen sensitiveness told him this instinctively, and, indeed, he had made a discovery that, though he did not admit it now, had staggered him.

He stood there at the open window chatting with her, but what he said he had no idea. His one thought—the one question which now possessed him—was whether she still loved him, or whether the discovery he had made was the actual and painful truth. Tall and good-looking, clean-shaven, and essentially easy-going, he stood before her with his dark eyes fixed upon her—eyes full of devotion, for was she not his idol?

She was telling him of a garden-party which her mother had arranged for the following Thursday, and pressing him to attend it.

'I'm afraid I may have to be in London that day, dearest,' he responded. 'But if I may I'll come over to-morrow and play tennis. Will you be at home in the afternoon?'

'No,' she declared promptly, with a mischievous laugh, 'I sha'n't. I shall be in the glen by the

first bridge at four o'clock, and shall wait for you there.'

'Very well, I'll be there,' he laughed. 'But why should we meet in secret like this, when everybody knows of our engagement?'

'Well, because I have a reason,' she replied in a strained voice—'a strong reason.'

'You've suddenly grown shy, afraid of chaff, it seems.'

'My mother is, I fear, not altogether well disposed towards you, Walter,' was her quick response. 'Dad is very fond of you, as you well know; but Lady Heyburn has other views for me, I think.'

'And is that the only reason you wish to meet me in secret?' he asked.

She hesitated, became slightly confused, and quickly turned the conversation into a different channel, a fact which caused him increased doubt and reflection.

Yes, something certainly had occurred. That was vividly apparent. A gulf lay between them.

Again he looked straight into her beautiful face, and fell to wondering. What could it all mean? So true had she been to him, so sweet her temperament, so high all her ideals, that he could not bring himself to believe ill of her. He tried to fight down those increasing doubts. He tried to put aside the naked truth which had arisen before him since his return to England. He loved her. Yes, he loved her, and would think no ill of her until he had proof, actual and indisputable.

As far as the eligibility of Walter Murie was concerned there was no question. Even Lady Heyburn could not deny it when she discussed the matter over the tea-cups with her intimate friends.

The family of the Muries of Connachan claimed a respectable antiquity. The original surname of the family was De Balinhard, assumed from an estate of that name in the county of Forfar. Sir Jocelynus de Baldendard, or Balinhard, who witnessed several charters between 1204 and 1225, is the first recorded of the name, but there is no documentary proof of descent before that time; and, indeed, most of the family papers having been burned in 1452, little remains of the early history beyond the names and succession of the possessors of Balinhard from about 1250 till 1350, which are stated in a charter of David II. now preserved in the British Museum. This charter records the grant made by William de Maule to John de Balinhard, *filio et heredi quondam Joannis filii Christini filii Joannis de Balinhard*, of the lands of Murie, in the county of Perthshire, and from that period, about 1350, the family has borne the name of De Murie instead of De Balinhard. In 1409 Duthac de Murie obtained a charter of the Castle of Connachan, possession of which has been held by the family uninterruptedly ever since, except for about thirty years, when the lands were under forfeiture on account of the Rebellion of 1715.

Near Crieff Junction station the lands of Glencardine and Connachan march together; therefore both Sir Henry Heyburn and his friend Sir George Murie had looked upon an alliance between the two Houses as quite within the bounds of probability.

If the truth were told, Gabrielle had never looked upon any other man save Walter with the slightest thought of affection. She loved him with the whole strength of her being. During that twelve long months of absence he had been daily in her thoughts, and his constant letters she had read and re-read dozens of times. She had, since she left school, met many eligible young men at houses to which her mother had grudgingly taken her—young men who had been nice to her, flattered her, and flirted with her. But she had treated them all with coquettish disdain, for in the world there was but one man who was her lover and her hero—her old friend Walter Murie.

At this moment, as they were together in that cosy, well-furnished room, she became seized by a twinge of conscience. She knew quite well that she was not treating him as she ought. She had not been at all enthusiastic at his return, and she had inquired but little about his wanderings. Indeed, she had treated him with a studied indifference, as though his life concerned her but little. And yet if he only knew the truth, she thought; if he could only see that that cool, unresponsive attitude was forced upon her by circumstances; if he could only know how quickly her heart throbbed when he was present, and how dull and lonely all became when he was absent!

She loved him. Ah, yes! as truly and devotedly as he loved her. But between them there had fallen a dark, grim shadow—one which, at all hazards and by every subterfuge, she must endeavour to hide. She loved him, and could, therefore, never bear to hear his bitter reproaches or to witness his grief. He worshipped her. Would that he did not! she thought. She must hide her secret from him as she was hiding it from all the world.

He was speaking. She answered him calmly yet mechanically. He wondered what strange thoughts were concealed beneath those clear, wide-open, child-like eyes which he was trying in vain to fathom. What would he have thought had he known the terrible truth: that she had calmly, and after long reflection, resolved to court death—death by her own hand—rather than face the exposure with which she had that previous night been threatened?

(To be continued.)

DANGEROUS FISH.

SOME MARINE BAD CHARACTERS.

By T. C. Bridges.

THE idea of fish constituting a danger to human life or limb would hardly occur to the angler who has never cast net or line in tropical waters. Yet even in our own British seas and rivers we have at least two fish which possess the power to make themselves extremely unpleasant. There are several instances on record of bathers being attacked by pike, and an old writer, Crull, tells of a giant pike inside which was found the body of an infant. Not long ago a good-sized retriever which was swimming in the Thames just above Chitty's boathouse at Richmond was tackled by a pike, which bit one of its hind-legs so badly as to sever an artery. It was another Thames pike which attacked that well-known naturalist and fisherman, Mr Cholmondeley-Pennell. He had actually landed the fish, when it sprang from the ground and fixed all its sharp teeth into his leg just above the knee. The creature hung so fiercely to its hold that a stick had to be used to prise its jaws apart.

The other British fish which can truly be called dangerous is the conger-eel. The experienced sea-fisherman takes care to kill every large conger as soon as it is brought into the boat. The conger has not only extraordinary jaw-power—it can triturate shellfish, shells and all—but is also so abominably active that the fisherman's opinion of it coincides with that held of the Indian by the Western plainsman: 'No good conger except dead conger.'

Ugly and savage brute as the conger is, it is a lamb compared with its relative the green moray of Bermudian waters. This great eel is of an unnaturally brilliant green, and has an eye which is the very epitome of intense and malignant ferocity. It is voracious and savage beyond words. The negro boatmen have such a holy horror of it that they absolutely refuse to allow a moray into the boat. An acquaintance of the writer, a marine officer, fishing in a small boat off Bermuda, hooked one of these fish; but as soon as his boatman saw the hideous head above the water he whipped out his knife and made to cut the line. The officer shouted to him to stop, but had to threaten to throw the man overboard before he would put up his knife. When the great eel was pulled over the side the nigger went absolutely ashy with fright. As for the moray, no sooner was it in the boat than it doubled upon itself, and its jaws met with a clash in its own side, cutting out a chunk of white flesh as neatly as a scoop would cut cheese. That was enough for the officer. He picked up a boathook and forked the uncanny creature overboard. Five years ago last June a green moray twelve feet long came ashore after a storm at Atlantic City, and was found by a coastguard on the beach. The man took it for a sea-serpent, and thousands of holiday-makers came to stare at it. It is described in a local paper as having 'full red lips and a double row of teeth.'

Of course the great peril and pest of tropical waters is the shark. Never so long as he lives will the writer forget his first experience of a shark. Years ago he was staying at Ormond, on the Atlantic coast of Florida, the same beach where the great motor speed-contests are now held. Early on the first morning of his arrival he went down to bathe, and, passing through the breakers on the bar, swam out to sea. Suddenly the familiar triangular fin appeared not fifty yards away, and then the whole back of a shark showed through the broken water. It was not a very large shark, and probably quite harmless, but the writer broke his own and most other existing swimming records back to the bar. Yet a shark's bark, so to speak, is worse than its bite. There has never been a case of a man being taken by a shark on the Atlantic coast of Florida north of Biscayne Bay; and though the Gulf fairly swarms with the ugly brutes, it is safe enough to bathe in a crowd and near shore. But the authorities will not let you dive off the end of a steamship pier on that coast, and rightly so. Very large sharks are sometimes caught in British waters. Five years ago fishermen from Kinsale found in their nets a blue shark ten feet three inches in length, which had inside its stomach three smaller sharks, each about four feet in length. Occasionally a blue shark is seen or caught on the Cornish coast; but they are very rare, and certain alarmist letters which have appeared in London daily papers on the subject of sharks and bathers are quite unjustified by facts.

The strangest shark-story which ever came to the writer's ears was of a shark that charged a steamer. This was in Queen Charlotte's Sound, and an account of the incident appeared in a Vancouver paper. The captain of the steamer, which was a small craft of only fifty tons or so, saw the shark on the surface on the port bow, and could not resist the temptation of taking a shot at it with his rifle. He hit his mark, whereupon the monster—said to have been fully twenty feet in length—deliberately charged the steamer. The boat quivered from stem to stern, and the captain said afterwards that it was like striking a rock. After this display of temper Master Shark had had enough of it, and sank out of sight.

A fish that has a thoroughly bad name in West Indian waters and all along the shores of the Mexican Gulf is the barracouta. Certainly the barracouta is an unpleasant-looking customer. He is long and narrow, shaped like a torpedo, blue-black above and

gray below, and he can swim at most amazing speed. Where he lives he is known as the devil-fish, a name common to all marine bad characters. The negroes have a perfect horror of the barracouta, which they aver will attack bathers and inflict upon them a mutilation impossible to describe. But whether there is any ground of truth in this accusation, which is also made against a fresh-water fish found in the Amazon, the writer has never been able to ascertain.

Another so-called devil-fish which is common on American coasts from thirty degrees north latitude to about the same degree south of the line is the giant ray. This fish looks very like a skate, but grows to an enormous size. It lies on the sea-bottom, covering square yards of coral sand, and if attacked may prove not only nasty but most dangerous. It is said to use its mouth like a shark, but its most unpleasant weapon is the toothed spear in its tail. Fishermen aver that it is able to drive this jagged lance right through a man's thigh. Such a wound is extremely poisonous, and almost invariably fatal. In the southern part of the Gulf of Mexico specimens of the giant ray have been killed up to eighteen feet across. The ray has two horns, one on each side of its eyes, the latter being green, hideous, and cruel beyond compare. A curious habit of this fish is to break water like a whale, falling with a thunderous splash which is heard for miles.

Some years ago a most strange case of a fatal accident caused by a fish was reported in the *British Medical Journal* by Dr S. Osborne Browne, of British Honduras. A boy went out to fish at the island called Cross Caye, when a fish known as the long-guard rose from the water and struck him on the bare chest, causing a punctured wound which proved fatal. Such an occurrence would seem almost incredible, but full details are given by Dr Browne. The fish was two feet three inches in length, and weighed one pound nine ounces. It had a sharp snout three inches long. The long-guard has the power of rising from the water and flying with great velocity for many yards. Cases were previously known of specimens passing through the sail of a boat and even penetrating the side, but this was the first instance on record of human life being lost through the long-guard's agency.

In the British Museum may be seen a specimen of a heavy oaken plank, once part of the bottom of a stout vessel, which has been pierced by the sword of a sword-fish. The weapon remains fast fixed in the timber. Along the Atlantic coast of the United States sword-fish are hunted both for their flesh, which is palatable, and also in order to protect the schools of blue-fish and mackerel which they ravage. Usually a sword-fish when harpooned swims straight away, just as a whale would do; but sometimes a large specimen will turn nasty and attack the boat. As its speed is simply tremendous, exceeding even that of a dolphin, the impact of half a ton or more of bone and muscle will drive the great beak through almost any timber, and bad accidents are sometimes heard of. There used to be an elderly pensioner at Old Point Comfort, Virginia, who had lost a leg through a wound received when engaged in sword-fishing. Whenever the sword is driven through a boat the men invariably do their best to break it off; for it is an odd fact that, once deprived of its natural weapon, the sword-fish instantly loses all its natural savagery and becomes harmless as a herring. Sword-fish hunters say that there is a natural enmity between the sword-fish and the shark, and tell stories of desperate duels between the two antagonists. The superior agility of the former makes up for the greater power and weight of the shark.

Of all sea-monsters, that which possesses the most powerful fascination for the general reader is undoubtedly the octopus. Some of the finest descriptions ever penned in fiction have related to duels between man and this horrible denizen of the rock-caverns of the sea-bottom. Victor Hugo was the first great novelist to describe a duel of the kind, and another very fine description of a similar contest is to be found in a novel by a writer whose work is familiar to readers of *Chambers's Journal*—namely, *Barbe of Grand Bayou*, by John Oxenham.

Ghastly and blood-curdling as these adventures read, fiction in this case falls far behind fact. About eleven years ago—it was in September 1897—there was a note in *Chambers's Journal* concerning the remains of a dead octopus thrown up by the sea upon the Atlantic beach near St Augustine, Florida. These remains, which were only a part of the living animal, weighed no less than six tons, or, say, twice the weight of an average full-grown elephant. The living animal must have had arms seventy-two feet in length, which means that the creature, when alive, was able to stretch a distance of nearly one hundred and fifty feet. We jeer at newspaper descriptions of sea-serpents. Could the most gruesome conception of the brain of excited journalist exceed in size or horror such a monster of the deep as this?

There are several varieties of the cephalopods, from the common octopus which is frequently caught off the Cornish coast, and of which there are some fine specimens in the Marine Laboratory at Plymouth, up to the *Octopus gigantsus*, of which the mass washed ashore in Florida was a portion. They are found in all seas except the far Arctic, and they need not be very large to be dangerous to man. There are some in Leghorn harbour with arms not more than four or five feet long, which yet inspire the utmost terror among the fishermen. In November 1879 a Government diver at work in the tideway of the river Moyne at Melbourne was seized by an octopus of similar dimensions, which fixed its horrible cup-like suckers on the back of his bare right hand and round his arm. For twenty minutes he hammered the loathsome brute with an iron bar which he managed to seize in his left hand; but it was not until he had almost cut the creature

to pieces that it relaxed its grip, and he and it were pulled to the surface together.

Some of the largest of these true devil-fish are found around the rocky shores of Newfoundland. In the museum at St John's is a portion of an arm of one of these monsters which in October 1873 attacked two fishermen off Great Belle Island in Conception Bay. The men saw the creature floating on the surface at some distance, and, taking it for wreckage, rowed up. When they caught sight of its huge glassy eyes staring up at them they were almost paralysed with fright, and, before they could turn, two rope-like arms fell across their boat and completely enveloped it. With the courage of despair, one man grasped a hatchet and slashed furiously at the tentacles. He cut them both through; and the creature, ejecting such a quantity of ink as to blacken the water for many yards around, sank back into the depths. The piece that was preserved measures nineteen feet in length, and it is estimated that it was cut off at least six feet from the body.

In April 1899 a terrible battle between man and devil-fish was waged in Neah Bay, on the western coast of the United States. A number of Tatoosh Indians were out in their canoes fishing with harpoons, when one caught sight of what he took to be a small whale rising and falling on the waves. The largest canoe was hurried forward, but as it approached the creature the harpooner uttered a cry of terror. 'Big devil-fish!' he yelled, and the crew backed with all their might. Too late! Next instant the immense tentacles of the sea-monster grasped their craft, and, though it was a forty-foot sea-canoe, cracked it like an egg-shell. All five occupants were flung into the sea, and as they fell two were grasped by the living ropes. One was caught round the throat and killed almost instantly; the second was pulled underneath and drowned. At this the other Indians paddled up, and a shower of lances were driven into the bloated, jelly-like body of the devil-fish. Between them they killed it and towed it ashore, where it was photographed by a local naturalist, Mr Frederick Edwards. From tip to tip of its outstretched arms this nightmare of the deep measured fifty-six feet, and its weight was two thousand five hundred pounds. On each arm were three hundred and fifty suckers running from the size of a saucer down to a mere pin-point.

According to Mr Bullen, the squid or cuttle-fish is the principal food of the sperm-whale. But apparently the game is not always one-sided. The same author relates a thrilling incident of a huge sperm-whale rolling on the moonlit surface of the sea enveloped in the mighty coils of an octopus far larger than any of which even fragments have yet been handled by man.

THE INVISIBLE MARQUIS OF GALLANTREVE.

By Robert Barr.

CHAPTER V.

EIGHT A.M. is too early an hour to make a call upon a young lady of position in the land, so Maurice Armelin strolled along the river-path, past the old mill and waterfall, and so to the margin of the lake that was in reality the mill-pond. As he approached the boathouse he stopped suddenly. Some one inside was singing, trilling like a happy bird, with no thought of audience. Maurice determined to retreat; but before he could even turn round the door of the boathouse opened, and mademoiselle stood there, flooded by the rays of the morning sun, looking delightfully fresh and new-made. She was very simply dressed, with collar open at the lovely throat, with glistening ringlets clustering round her shapely head.

'Oh!' she cried, pausing in her exit, and seemingly half-desirous of retreating again; but the nonchalant young man took no more notice than if this were the most ordinary encounter and he had been invited to attend. The influence of the eastern sun brought a delicate flush upon her fair face.

'Good-morning, mademoiselle,' said Armelin. 'Been swimming?'

She laughed a little. 'Yes; I dived under the doors; that is why my hair is so wet.' And she shook out her ringlets in a manner so distractingly charming that the young man bent his eyes to the grass at his feet lest she should see more in them than he intended.

'Ah,' he went on, 'I know that trick! Many a hundred times I have done it.'

'Not here?' she said, stepping forward.

'No, not here, of course; but I love to dive under boathouse doors,' he ended, somewhat lamely.

She looked upon him with wide-eyed admiration. Here was not the formal, sombrely clad *avocat*, but an Adonis who looked ten years younger. It flashed upon her that she might hesitate to ask guidance from a youth so plainly belonging to the gay world, so she brought this unexpected meeting at once to a business basis.

'Have you heard from the Marquis this morning?'

'Not this morning, mademoiselle. I received a telegram last night.'

'Really! He is very prompt. What does he say, monsieur?'

'I will show you his telegram by-and-by, mademoiselle. Meanwhile, let me ask a question. Have you breakfasted?'

'Oh, I enjoyed my *petit déjeuner* hours ago. I

shall breakfast at eleven, and the pleasure of looking forward to that meal will be enhanced if monsieur will condescend to be my guest.'

She made him a pretty, old-fashioned curtsey that seemed somehow to accord well with the simple gown she wore, and she reminded him of a painting by Watteau that he had seen in the Louvre. He placed his hand on the appropriate part of his white flannel coat, and bowed as perfectly as one of his most accomplished ancestors might have done.

'Mademoiselle, I accept with alacrity and great pleasure. Your invitation gives a touch of perfection to this glorious morning, which I had already thought perfect.'

Once more she laughed a little, and then sighed. Really the situation must not get out of hand. This, after all, was a conference relating to practical affairs.

'We shall have much to talk about, you know,' she said demurely.

'Undoubtedly.'

'Tell me what is the Marquis's decision.'

'Ah, the Marquis! I had forgotten him for the moment. Well, mademoiselle, I think it best to show you his telegram, which will place at your disposal all the information I already possess. As you remarked, we shall have much to talk about; therefore I propose to lower one of the boats.' He checked himself. 'Ah, I take it for granted that there *is* a boat within?'

'There are four of them,' she replied.

'Well, we will choose one, and make a voyage up the little river—that is, if the water is deep enough.'

'Oh, yes, the mill-pond makes it possible to ascend for five miles; farther if a canoe is taken. I shall be delighted to accompany you, monsieur. Pardon me while I run up to the château and find Madame Durfer.'

'Why bring Madame Durfer?'

'Oh monsieur, I must take my chaperon with me!'

She glanced admiringly at him, and the glance seemed to say, 'My dear sir, you are not to-day the solemn *avocat* of yesterday.'

'The boat I shall select, mademoiselle, on this occasion will hold only two.'

'I could not think of it, monsieur,' said the girl breathlessly.

'It is the order of the Marquis, mademoiselle.'

'The order of the Marquis! Does the Marquis de Gallantreve venture to subject me to his orders?'

The young man shrugged his shoulders, it seemed with a gesture of indifference. The lady had drawn herself up with some indignation, and her eyes flashed a look on him that differed from any other he had ever received.

'Really, mademoiselle, you balk at trifles. If yesterday you proposed to place yourself permanently under the orders of the Marquis, why should you hesitate to obey a command given to-day?'

'A command, monsieur! I am not one to be commanded.'

'Very well, mademoiselle,' said the *avocat* quietly, taking off his hat with a gesture of farewell. 'I have the honour to bid you good-morning.'

As the young man turned away, mademoiselle impulsively sprang forward and placed her hand on his arm.

'Wait, wait, wait!' she cried. 'You are not going to leave me like this?'

'Mademoiselle, what can I do? I represent the Marquis de Gallantreve.'

'But you represent me also! You promised yesterday to advise me,' she interrupted, speaking rapidly.

'Certainly; but you refuse to take my advice.'

'Oh, I don't! I don't! What is your advice, monsieur?'

'My advice is that you allow me to let down the boat.'

'Oh!' She seemed nonplussed, and stood there hesitating. Somehow this did not accord with convent instructions, with the custom of the country.

'You mean that I should go up the river alone with you?'

'Certainly, mademoiselle. If the Marquis de Gallantreve trusts me with his future wife, why should *you* object?'

'True, true! I had not thought of that. You put things very clearly, monsieur.'

'It's my profession, you know.'

'Yes, so it is; but Madame Durfer'——

'Oh, Madame Durfer! Madame Durfer has nothing to do with this. Saints preserve us! if I wished to buy sixteen large cannon from you, would you insist that Madame Durfer should be present during the negotiations?'

'No; but you would not buy the cannon from me. My business manager would attend to that.'

'Of course. I'm merely using an analogy. He wouldn't want Madame Durfer there. What I am desirous of pointing out is that this is entirely an arrangement looking towards the marriage, I representing both parties, as one might say. I must consult with each of them. When the Marquis telegraphs me to see Mademoiselle Maillot alone, and mademoiselle refuses to see me alone, there is nothing left for me but to return to Paris.'

'I see, monsieur. I have been most unreasonable. Pray forgive me. Shall I summon the servants to get ready the boat?'

'Oh, do not trouble, mademoiselle; I can manage it without assistance.'

The girl stood on the platform, and watched him open the wide doors that gave access to the river, then very deftly lower one of the boats into the water. He made a nest of cushions for her comfort, selected a pair of oars, placed them on the rowlocks, and with one hand holding the craft steady, raised the other to her with a smile. The girl stepped daintily into her place, and a touch of the oars sent

the boat far out from under cover. He turned the prow up-stream, and rowed with easy, skilful strength. The girl leaned back on her cushions, sometimes looking at him, sometimes watching the ripples made by her slim, trailing fingers in the water. The river narrowed and narrowed; the great château sank out of sight. At last they entered a tunnel of green, subdued light, trees arching overhead, complete silence everywhere. Neither had spoken since they left the boathouse. Maurice deftly drew in his oars, letting the boat progress with its own impetus.

'Here is the telegram of the Marquis, mademoiselle.'

'Oh,' she cried, waking from her reverie, 'I had forgotten him!'

She did not offer to take the telegram, so he bent forward and placed it on her lap. She took up the message rather listlessly, preparing it for perusal with indolent grace; but before the reading was finished mademoiselle was sitting up straight enough, and displeasure was indicated by two or three scarcely perceptible upright lines which marked her smooth forehead just above the nose. The telegram was a long one:

'*To* MAURICE ARMELIN, *at Josslyn's Farm.*

'The proposal interests me; but as I have given no thought to this matter heretofore, I beg you to act for me. Delay reply for a week at least, and during that time see the lady alone as much as possible. Ask her to show you the beauties of the estate. Discover her faults, if any, and report to me. I shall then do whatever you advise.—HENRI.'

'You don't seem to be pleased with the communication, mademoiselle.'

'No, I am not. It is such an order as he might send to his bailiff instructing him to choose a horse, kind, gentle, and well broken.'

'Which lady is speaking now?'

'Which lady?'

'Yes. You must not forget that you are two persons: one is a guardian, shrewd and business-like; the other is a prospective fiancée, just out of the convent, knowing nothing of these needful preliminaries. It was to the guardian I gave that telegram.'

'Indeed! I fear I shall find this duplicate personality somewhat embarrassing.'

'You did not do so yesterday.'

'No; I thought it a very simple matter yesterday; but to-day it seems to wear a different complexion. I thought perhaps the Marquis himself might appear.'

'Ah, guardian, you could hardly expect that. It would be rather awkward if at the last he was impelled to refuse. I think it much more delicate on his part to depute the investigations to me.'

'Perhaps you are right, and doubtless you have set down in your mental note-book petulance, impatience, and perhaps injustice as three bad qualities possessed by the young lady.'

'Oh no, no, no! Again you are mixing things up. The young lady knows nothing about all this. You as her guardian, I representing the Marquis, bring our negotiations, let us suppose, to a successful conclusion. Then the swain appears on the scene, is introduced to his inamorata, and from that time forward they are happy together. The petulance, impatience, and so forth belong to the guardian, not to the dulcinea. The Marquis and I have no interest in the personal qualities of the guardian.'

'I think I understand at last, and if stupidity is to be added to your list, please remember it is to be accredited to the guardian. Down at the boat-house you spoke of your position being difficult, but it is simplicity itself compared with mine.'

'Oh, you will soon get used to it. To make your problem easier, I shall, with your permission, always address you as "guardian" when we are attending to the business side of our conference, and "mademoiselle" when I am making the acquaintance of that charming young lady.'

'Very well, that is agreed, then; and now, will you turn the boat round, Monsieur Armelin? I recognise that the situation requires a little more thought than I have yet given to it. I can only think connectedly in my boudoir; and with your permission, monsieur, I shall shut myself up there for an hour.'

'A very good suggestion, guardian; but if you insist on returning to the château you must walk, for I am going to take the boat farther up the river.'

'Walk!' exclaimed the girl with indignation, her eyes ablaze.

'Yes; I suppose you know the way. Mademoiselle and I are going up the river together.'

Mademoiselle continued sitting bolt upright for a minute or two, then a smile came to lips and eyes as she reclined back lazily among the cushions, interlacing her fingers behind her head.

'You are a very bewildering person, Monsieur Armelin.'

'I have been with your guardian all the morning, and she is sometimes difficult to deal with. She has so bewildered me that it is no wonder you notice the effect. Have I your permission to take you farther up the river?'

'You may take me where you will,' answered the girl dreamily, looking at him from under half-shut eyelids.

'And now, mademoiselle, as this is the first time I have seen you to-day, may I give myself the pleasure of wishing you good-morning.'

'Good-morning, Monsieur Armelin.'

'I hope, mademoiselle, you slept well last night.'

'Excellently, monsieur. And you?'

'I regret to say I did not sleep, which was disappointing, for I wished to be very wide awake to-day, and observant.'

'Yes, and observant. What drove sleep from your eyes last night, monsieur? Thinking of that nice new suit of clothes?'

'How do you know it is new?'

'I judge from appearances only.'

'I was thinking of suits, but not of this one. I thought it strange that the Marquis de Gallantreve, merely because I won his case in a lawsuit, should think me competent to win his case in a lovesuit.'

'That sort of talk should be kept for my guardian. I know nothing of law, or—or of the other thing.'

Maurice smiled down upon her. 'The Marquis will teach you, mademoiselle.'

She gave a little wriggle of impatience. 'Oh, bother the Marquis!' she cried.

'With all my soul,' agreed Maurice. 'Let's talk about ourselves.'

'Yes, tell me how you became an avocat.'

But as we know all about that already, we may leave the young people to their discussion.

The week passed very quickly for both of them. They motored together, drove together, boated together, and for all that Marie Angelique saw of the young man he might almost as well have been living at the château. As the week sped on Maurice Armelin became more and more cheerful and brilliant in his conversation. He told himself he had never really lived before; but, on the other hand, Mademoiselle Maillot grew wistful and silent, until finally the morning of their last day dawned.

'Mademoiselle,' he said, 'I plead for a concluding walk together. May I have the pleasure of accompanying you to the forest on Josslyn's farm, and there, by the river-side, we will bid one another good-bye?'

She did not answer except with a bow of the head, and they walked side by side, with very little said between them, until they reached the spot he had indicated, and there they sat down together beneath the trees.

'Mademoiselle,' he began, 'this has been a week in Paradise.'

'Yes,' she replied indifferently, without looking up at him, 'the estate of Gallantreve is indeed a Paradise.'

'That was not precisely what I meant, mademoiselle. Perhaps you will understand my remark when I confess that I have found you absolutely faultless, and shall so report to the Marquis of Gallantreve.'

To his astonishment, the girl turned her face to the trunk of the tree beneath which she sat, and began to weep quietly.

'What have I said?' he demanded.

'Oh, you have said nothing.' Then she sprang to her feet, dashing away the tears, seemingly angry that he had been a witness of her emotion. When she spoke her voice was hard enough, and under sufficient control.

'The week has ended,' she said, facing him, as he too arose and stood before her. 'The Marquis will be quite within his rights if he rejects my proffer, in spite of your recommendation, will he not?'

'Within his rights—yes; but if he acted thus I should not call him a gentleman.'

'Then, possibly, you will not call me a lady. If one party to the compact has the right, the other party logically must have a similar remedy?'

'Certainly. You reason like a lawyer.'

'Thank you. I suppose you intend that for a compliment. I, therefore, announce to you, monsieur, that nothing on earth will induce me to marry the Marquis of Gallantreve!'

'What excuse can I make to the Marquis, mademoiselle?'

'Am I compelled to vindicate my action?'

'I think you owe that much to the Marquis, and also to yourself, mademoiselle.'

'In that case you may say that I do not love him, and will never marry a man I do not love.'

'There has been a radical change in your opinion since this day week.'

'Yes. I had imagined a man that does not exist.'

'The Marquis does not exist!' cried Maurice, apprehensive that she had discovered his duplicity.

'Does not exist as I had pictured him. The man I had fancied him to be was constructed from your speech in court and my imagination in the château. If the Marquis de Gallantreve had been the man whose feelings you described he would never have remained so long in Paris without visiting his own homestead. Have I given you sufficient reasons for my conduct?'

Armelin shook his head. 'I fear he will not think them sufficient.'

'I do not care in the least what he will think; but if he feels himself ill-used, tell him I have still another and a stronger reason in reserve, which I will confess to him, but not to you.'

'Thank God that between us we have eliminated the Marquis—a useless creature at best. Now, mademoiselle, he being out of the way, I do myself the honour of proposing for your hand in marriage.'

'You!'

'Yes, I.'

'Then I have the honour of declining your proposal.'

'Why?'

'Must I give reasons to you also?'

'Yes, if you can give the same reason.'

'What do you mean by that, monsieur?'

'I mean that if you tell me that you do not love me, and cannot love me, I shall bid you good-bye and never see you again.'

'Oh!'

'I am waiting for your reply, mademoiselle.'

'This has been all a joke to you, monsieur. You have angered me exceedingly time and again.'

'That is no answer.'

'My answer is that I refuse to marry a man who is not in love with me.'

'Mademoiselle, I have loved you from the first moment I saw you. Did you not see how startled I was when you made your proposition for that worthless wretch the Marquis, when before you, quite unheeded, ignored, passed by, sat such an example of worth and affection as myself?'

The girl turned from him with impatience. 'You are pleased to joke again, monsieur.'

'I assure you I am not. I consider myself every whit as good as the Marquis.'

'What shall you tell the Marquis?'

'I shall tell him you fell in love with me.'

'Really? And you will add that at the end you took an effective means of curing me of my infatuation?'

'I shall add nothing of the sort. Your infatuation, like my own, cannot be cured, and thus I prove it to you.' Whereupon, in spite of her attempt to elude him, he clasped her in his arms, and, without encountering insurmountable obstacles, kissed her.

'Now, dear mademoiselle, to show you that I have loved you from the first, I came here not to evict you, as you suppose, but to bring to Josslyn and to Marie Angelique the executed deed which gives the freehold of their farm to them and their heirs for ever. I resolved not to present this parchment to them, but to cause it to reach them from your hands. Here it is, mademoiselle. Come with me to the farm, and make Marie Angelique nearly as happy as I am.'

'As *we* are, you should say. Why did I never think of giving them the farm myself while I owned it? I did lower the rent. How generous, after all, the Marquis must be! I fear I did him an injustice.'

'Oh, not a bit of it. He gives them the farm merely for his own selfish gratification.'

And so they walked together to the homestead, and were received by the cheerful Marie Angelique, to whom mademoiselle made a pretty speech before presenting the legal document.

'And now, Marie Angelique,' said Maurice, patting her on the huge shoulder, 'one good turn deserves another. Mademoiselle and I have never been introduced, and thus we have walked about together contrary to all French customs. Marie Angelique, introduce me to mademoiselle.'

'But surely by this time you need no introduction?' protested Marie Angelique.

'Woman, how dare you trifle with me thus? Introduce us, I say, and that speedily.'

'Mademoiselle Maillot, have I your permission to introduce to you Henri Francet, eleventh Marquis of Gallantreve?' said Marie Angelique.

THE END.

SANTOS PAST AND PRESENT.

'GIVE A DOG A BAD NAME, AND'—

IN an article entitled 'Why Boys Shun the Sea Career,' published in *Chambers's Journal* of December 1907, both Rio de Janeiro and Santos are referred to as 'death-holes.' In fairness to these two important seaports, and to the Brazilians themselves, it is very necessary to refute such an erroneous statement calculated to do very much harm to a friendly nation and to those interested in business with the ports referred to.

Rio de Janeiro, the capital of Brazil, and the most beautiful city in the world, is not what it was many years ago, but is a very healthy place, well drained, and being wonderfully improved every year; in fact, old residents who have been away for a few years would not now recognise it.

It is of Santos, however, that I am better able to write, and I wish to show my appreciation of the hospitality extended to a foreigner, who has resided for nearly twenty years within a few hours of the port of Santos, by endeavouring to disabuse the minds of the British public of the strong belief, still prevalent, that Santos is even now the terrible hotbed of yellow-fever and malaria which it was eighteen and twenty years ago.

On 29th December 1890 I arrived at the port of Santos on board the old R.M.S. *La Plata*, and well I remember that day! It was overcast and very hot, just midsummer, hardly a breath of air stirring even away out in the stream, where we lay waiting for the visit of the port doctor and the Customs authorities, for no one could leave the ship until these 'visits' had been made.

The passengers who were to land were told to get their baggage ready, and the smaller things would be examined on board by the Customs officer. As soon as this ordeal was over we were allowed to hire a boat, of which there were a number alongside the steamer, the owners of which were all shouting at once to try to get a fare. Having listened to my friends haggling (in an unknown language) and then striking a bargain with a powerful-looking fellow, who brought his boat to the foot of the ladder and ran up to the deck to fetch my things, I went down into the boat, and, oh! the stifling atmosphere down there, with the heat reflected from the glassy water. About ten minutes' pull brought us to a rickety old pier, with slimy wooden steps, on which we landed, and through which I thought I should fall. The tide was out and the foreshore was nothing but black slime and filthy, stinking mud.

I stayed the night at the house of a friend at the suburb called the Barra, overlooking the sea; and the next day, after getting the rest of my luggage through the Customs, I went to the neighbouring city of São Paulo, about two and a half hours by rail from Santos. Of the summer season of 1890–91 I have little recollection, as, being then employed in a bank, I had little to do with Santos. A few months later, however, I joined a commercial

house with a branch in that port, and of the summer season of 1891-92 I have very vivid recollections. Yellow-jack was raging amongst the shipping and throughout the whole city. To make matters worse, there was a boom in trade, and the port was crowded with shipping of all kinds; sailing-vessels, coal-ships, and steamers with general cargo were anchored out in the stream, waiting there, amid the miasmas and mists from the surrounding swamps, for their turn to come alongside one or other of the few small private wharves to unload, not a few having been known to lie as long as six or eight months ere they were able to get a berth.

It became a regular thing to inquire, when we got to the office in the morning, 'What news from Santos to-day?' 'Who has got the fever?' 'How is So-and-so?' too often the reply being, 'Died last night;' 'X. is away ill to-day;' 'Captain, third officer, and three men died to-day, and four more men are down,' and so on; it being a rare thing to receive a more cheerful reply that some one had recovered. I have known of the whole crew of a ship being carried off, a new crew sent out from home, and the whole of them also dying in a few weeks. Things came to such a pass that several steamship firms made arrangements for the entire ships' companies to come up to São Paulo, or to a small village in the hills nearer to Santos, until the ships were ready for sea again. Many were the deeds of true heroism done in those days by men and boys who, in spite of all risks, nursed the sick.

Thank God! these are all now things of the past, and it is a fact that every year sees Santos more and more crowded with visitors from all parts of the state of São Paulo, who go there for their holidays, and by the doctor's orders, to take sea-baths. I myself have been going there for several years with my wife and children for two or three weeks' holiday.

The two principal reasons for this great change in the health of Santos are that the city is very much better drained, and has an excellent supply of very good water, and that the foreshore, which in the old days was nothing but stinking mud, is now covered for a distance of several miles with as fine a line of quays as can be found in any part of the world. These can berth the largest steamers (of over ten thousand tons) which come to South America. All the large steamship companies—the Royal Mail, Pacific Steam Navigation, Lamport and Holt, Prince Line, Hamburg-Südamerikanische, Nord-Deutscher Lloyd, Messageries Maritimes, two or three Italian lines, a Dutch line, a Spanish line, &c.—send their best boats regularly every week or fortnight to the once carefully avoided port of Santos.

The city is supplied with most excellent water brought in from the hills a few miles distant, there being no lack even in the hottest weather. A good tram-service exists, connecting the city with the sea-front called the Barra, where there are two good hotels, which are filled to overflowing with visitors for about six months in the year. Across the river from the Santos quays is the island of Santo Amaro, on the far side of which, on the open ocean, is a hamlet called Guarujá, composed of a hotel and a number of private residences, the permanent abode of some business men and their families, as well as the resort of many visitors during the cool season. The passengers in transit by all the large steamers outward and homeward bound generally visit one or other of these places while their steamer is in port.

Santos is the second port of Brazil, commercially speaking, the trade carried on being of world-wide extent. Its chief article of export is coffee, about three-quarters of the world's supply passing through the port, the total for the season ending on 30th June 1906 having attained the enormous figure of fifteen million bags, which were sent to all parts of the world.

The water-supply, lighting, and tramway services are in the hands of a very prosperous English concern called The City of Santos Improvements Company, and there are three banks—two English and one German—and many important export and import houses. The port is connected with the interior by the São Paulo Railway, a line famous in the annals of railroad enterprise as one of the most wonderful and best paying in the world.

Much could yet be said of the state of São Paulo, its capital of the same name (with its two hundred and fifty thousand inhabitants), and of the many enterprises, vast coffee estates, the mineral and agricultural wealth of this part of Brazil; but the object of this article will have been attained if it helps to convince the British public in general, and 'those that go down to the sea in ships' in particular, that the much-maligned port of Santos is to-day one of the finest and healthiest in South America.

SONG.

THERE is a dimple in her cheek,
Another in her chin:
Quicksands that lie in wait, and seek
To draw the heedless in.

They sparkle in the light that shines
From laughing lips and eyes;
And not the wisest man divines
That danger in them lies.

And him who comes in love or sport
In soft embrace they keep;
So that he sinks, in sight of port,
A thousand fathoms deep.

Wise if he knows his certain doom
To that smooth eddy drawn,
He finds in the sweet deeps a tomb
Well worth his freedom gone.

ROYAL HOLYROOD: SOME RECOLLECTIONS.

By An Ex-Custodian.

'DEAR old Holyrood!' was a favourite and a frequent exclamation of the late Lord Leven, who for so many years held the position of Lord High Commissioner to our National Church. Of the many potentates and princes, great ones of literature, stars of Thespian fame, heroes of the battlefield, famous politicians who have found place in history—visitors to our 'dear old Holyrood'—there was ever an invariable absence of all symbols of greatness which one might expect from their exalted station and the record of their past. One exception only I remember. An African potentate—a tall, handsome, noble-looking, yet half-tamed black—returned my salute with all the dignity and grace of a true emperor.

It was a manifest pleasure to Lord Leven, whose love for and benefactions to Holyrood are well known, to stroll through the old towers and be shown the secret stairs with which the enormous walls are honeycombed, and the jail into which all these stairs converge. The prison of the original palace is still there, with its oaken, bolt-headed doors and jailers' peep-holes, as in the time of the fifth James, when both peer and presbyter passed many bitter days within its walls—curious nooks, the existence and purpose of which are still as a sealed book to the would-be historian and the illiterate guide. One little adventure which his lordship was fond of relating happened during the sitting of the General Assembly of the Church of Scotland. There are of course at that time a large number of extra servants, men hired for the festivities, some of them of an unproved stamp. For the solace of these retainers a lorry-load of beer is requisitioned and dispensed with an unsparing hand, and it was over an escapade of one of these worthies that his lordship had a hearty laugh. Having a few quiet moments to spare on a Sabbath-day, he sauntered into his favourite haunt, the Chapel Royal. Alongside the south aisle there lie a few stone coffins found in the grounds in 1857, and when strolling along the Earl was amazed to see one of his extra servants lying fast asleep in one of these fourteenth century sepulchral relics, having evidently sat down to cool, fallen asleep, then slid gently into the stone coffin.

It has often been said that visitors from abroad sometimes know more about Holyrood and Scottish history than many natives. This was strikingly brought home to me one day when conversing with the Crown-Prince of Siam. His Royal Highness, small of stature, keen, yet self-controlled, was accompanied by part of his suite, and by all the party was displayed that searching, watchful power of scrutiny so characteristic of Eastern nations. In conversation his English, quietly delivered, was excellent, and his knowledge of Scottish history shamed some of our Irish and English officials. Going through the much-criticised Portrait Gallery, he showed that the story of Bruce and his Stuart descendants had been part of a well-studied history of European thrones; and the story of Mary Stuart and Holyrood, the Scottish descent of our reigning house from Elizabeth of Bohemia, and the line of Charles the First, her brother; and he alluded to Prince Rupert of Bavaria and his mother, with whom, he explained, he had become acquainted at the late Queen's Jubilee, all given as perfectly as if he had been a prince of our own dominions. Nor was the story of Charles Stuart and his deposed grandsire unknown, or the unfortunate risings of the Braes of Mar and the '45.

The Crown-Prince of Germany paying a private visit to the old Towers of James V. under the auspices of Lord Rosebery, I was in attendance, and was not only gratified with the pleasant—nay, gentle demeanour of the royal visitor, but was also both pleased and amused with his lordship's pawky remarks and guidance of his royal protégé. But when we reached Lord Darnley's Supping Room it became my somewhat risky duty to put a spoke in his lordship's wheel; for surely I had good cause when I saw and heard that he had mistaken the room as the scene of the murder. I interposed, 'Oh no, my lord; this is where they assembled; this is Darnley's Room, and that is the famous stair

[All Rights Reserved.]

they went up to Queen Mary's Room above.' With a good-humoured laugh he quickly said, 'Oh, indeed —then we must do just the same to carry out the whole spirit of the thing!' The key of the gate leading to the little turnpike-stair was kept by an ancient Highlander, who was caretaker at the time, and a painful search ensued before it was found; but the party waited patiently, then in single file followed the conspirators' route up to the Supping Room of the Queen.

Afterwards, when we came to the royal vault in the Chapel, his lordship again suggested that the Prince should enter and see the place where lay the bones of his Scottish ancestors, almost uncared for and unnamed; but the same difficulty here again barred the way, and the visit was abandoned. A short time after, when conversing with a smart young American lady about the party going up the conspirators' stair 'to carry out the whole spirit of the thing,' how quickly she nonplussed me by asking, 'Did they carry it out? Did they have a murder?'

Perhaps one of my most pleasant recollections carries me back to the genial, gifted Henry Irving. During an engagement in Edinburgh, he was off the boards suffering from an affection of the throat, and paid a visit to Holyrood. Sir Henry was the very pink of courtesy and good-humour, and I felt that I was highly honoured when in carriage-and-pair the great exponent of Shakespeare drove up to the Palace, inquiring for his old correspondent. I had been writing on old Edinburgh comedians, and had corresponded with Irving on the subject. I had also been suggesting a play on Holyrood in Queen Mary's time, with the character of John Knox for his rôle amplified. He doubted the experiment, as the play of Mary Queen of Scots had been so often tried with small success. I did my best, pointing out that in his hands the results would be different; but the matter, further than an outline of the subject, was closed by his tragic death.

We had a grand forenoon's ramble through the famous old Towers and Chapel Royal. It was not the petted, dignified favourite of the world we were dealing with, but the jocose, courteous gentleman, delighting to recount his early career in our city, and dealing with the Stuart history as a scholar and a patriot. Before the portrait of the misguided hero of fatal Flodden we were favoured with a taste of his quality. Pausing for a space, and with a quotation from *Marmion*, he turned to me, saying, 'Mr S., you have heard of John Coleman, the once-famous tragedian? One night on the stage he was declaiming, in his solemn, pompous style, on the power and might of the English arms, when a stray Scot in the gallery, unable longer to bear the English taunts, yelled out with an ugly oath, 'You ——, mind o' Bannockburn!' The whole was given, action as well, in the great artist's best style.

I don't forget how, when we reached the famous stair in Darnley's Supping Room, we were taken down a bit, as after a swift glance into the historic traitor's path—the relic of nigh five centuries agone —he turned to me with a twinkle in his eye, and in quite tragic tones cried, 'Ah, now we have the genuine!' So long as he lived Sir Henry never forgot his correspondent in Holyrood, and, alas! the last letter I received clearly presaged the speedy closing of a brilliant career.

One story concerning the famous blood-stains has long been told by the keepers of Holyrood. In the fifties, when the late Queen began to frequent the royal apartments, an old lady, either keeper or cleaner, was one morning showing Prince Albert up to Queen Mary's rooms. The Prince, as they reached the top of the stair, quietly asked where were the indelible blood-stains. The form of a lady peering at the stains barred the view, and the cicerone snapped out, 'They're there, if that wuman wad stand oot o' the wey!' It was the Queen, who had stolen a march on the Prince Consort.

In those times the keepers of the rooms had no little difficulty with the Rizzio stains. One day a Yankee was caught cutting out a splinter from the planking to carry across the Atlantic. At other times the vendors of washing-powders would be found on their knees testing the infallible powers of their wares on stains.

It was indeed a strange sensation when I stood in the Picture Gallery of Holyrood conversing with one whose forebear took fatal part in that historic scene witnessed by both armies on the eve before the mighty clash of arms on the field of Bannockburn. A fine, tall, aristocratic-looking gentleman, with a young lad of about sixteen, sought the portrait of the Bruce. I led them to the pitiful effort of De Witt, where, after a few moments' pause, the elder gentleman, turning to the youth, in full-voiced accents exclaimed, 'There's the fellow who cracked your ancestor's skull that night at Bannockburn!' Seeing my interest and surprise, he then courteously explained to me that the young gentleman was the direct lineal descendant of the unlucky Sir Henry De Bohun, whose encounter with King Robert will be an ever-remembered incident in Scottish history. My after-thoughts of this episode were precisely similar to those evoked by the visit of the German Crown-Prince, that they were not what one was prepared to expect as representatives of the fighting, warlike time, but rather mild, unassuming, young gentlemen of peaceful tastes.

Frank and affable, without the slightest shade of patronage, I found the Duke of Argyll. Our talk was of the forties, when his relatives, the Campbells, had apartments in the east side of the Palace, and the ducal Hamiltons almost the whole of the north and west wings, and of their almost daily visitors, John Sobieski Stolberg and Charles Edward Stuart, to whom, when a boy, I often touched my cap. These two gentlemen, who were usually in Highland garb, but also at times wore the cavalry braided frock-coat, were very frequent visitors to the Argyll residents

in the Palace, and no well-bred boy ever passed them without saluting the claimed descendants of Prince Charlie. The Duke, who was perfectly acquainted with the history of these gentlemen, was more particularly struck with the fact of so many of the paintings in James the Fifth's Towers belonging to the Duke of Hamilton, as he remembered that in the Argyll apartments there were only a very few, of no great account. Of course it will be remembered that when the Queen began to take residence in Holyrood the Argylls and Breadalbanes had to quit.

The Duke was too young to have known the Sobieski Stuarts at the time they frequented the Palace, but probably met them after they had left Edinburgh to reside on the island of Aigas, on the river Beauly, in a house built by Lord Lovat. In the adjacent hamlet of Wester Eskadale, they are interred in a Roman Catholic graveyard, where a large tomb of polished red stone, with crown and broken sword, now tells the story of their claims as Counts of Albany, the title adopted by Prince Charles when he went into retirement to his seat at Albano.

It was after a conversation with the Duke, and when he had reached Queen Mary's little chamber, that I was sent for to answer a query: 'Do you recollect the names of those present in this room when Rizzio was dragged away by the conspirators?' then he added, 'Of course we know the Countess of Argyll was here.' I replied, 'Yes, your Grace; and you are standing on the exact spot where she sat, at the foot of the table, opposite the Queen. There was Lord Robert Stuart, the French doctor, the Master of the Household, Arthur Erskine the Master of Horse, the gentleman-in-waiting, and the page Anthony Standen, the Queen and Lord Darnley in the double chair at the head of the table, with Rizzio at their back in the window recess;' giving, of course, for confirmation my authorities, including Mary's letters to her uncle of Guise, Lord Ruthven's confessions written in Newcastle (whence he fled and died), and others. The Duke's visit was quite unexpected. He was alone, in fine spirits, and entered into many racy reminiscences of the time when Holyrood was full of courtly life.

No item of Queen Victoria's Jubilee rejoicings gave greater satisfaction than the assemblage in our midst of native troops from the far-distant and varied tribes who own allegiance to the British flag. Not a few will remember the magnificent, stately—nay, majestic marching of these troops through our streets; and the sight of these men of every costume and almost every clime in the ballroom of the '45 brought to me a cloud of reflections. It was a strange sight to see the stalwart Mahratta, the mild, fine-featured Hindoo, the bare-footed African, the turbaned Asiatic, assembled in the Gallery of Kings. The hall where only about a century and a half ago the winsome Prince gave audience to crowds of the best and loveliest of the land was now the trysting-place of semi-barbarous soldier tribes, many of whom in his time were to the people of this country almost unknown. Not now was heard the bagpipe wail, but the language of Babel resounded, and the deadly rifle had relegated the broadsword to the halls of antiquity for ever.

From the fourteenth century, when Robert the Bruce reigned, and when Scottish history was one continuous battlefield, one eternal struggle to throw off the English yoke, the Wauchopes of Niddrie have proved one of our best and noblest of Scottish families. The late General Wauchope, standing in the old Towers of Mary Stuart's sire, in the little Supping Room of Lord Darnley, told us, as he peered into the dark, horrible stair: 'That is the stair by which Archibald Wauchope, one of my ancestors, went up with Bothwell to murder King James;' adding, 'He was a bad man.' This of course refers to the mad, illegitimate cousin of James VI. and his wild escapade in 1591, when Jamie fled down the back stair, 'breeks in hand.' On my mentioning this interview to the venerable Dr W. H. Gray, he made reply, 'When Andrew Wauchope told you that, depend upon it that it was both true and correct.' The good Doctor also told me that the famous soldier had been an elder in his church at Liberton; and in point of fact the family name had been for five hundred years on the members' roll of church and chapel of the parish.

There are but few who clearly remember the great battle of experts over the restoration of Rosslyn Chapel, and how the Earl gained his point and left us the loveliest little chapel in our land. More recently came the restoration of St Giles' by Dr William Chambers, and William Nelson's artistic restitution of the old Parliament Hall from the whitewashed hospital of the barracks. But in each of these cases the men of taste had more than the poor, shattered remnants of Holyrood upon which to show their skill; they had in St Giles' and the Parliament Hall entire structures only to be internally remodelled, and in the case of Rosslyn Chapel the grand florid carving was there ready to be picked out. Even in these instances the cost was known to be enormous. With our grand old Chapel Royal there would be but little of the old fabric to show, even after twice the amount bequeathed by Lord Leven had been expended. How much better a well-preserved ruin in which the pilgrim can conjure up visions of the long past, the kings who have here knelt in pious devotion; of Bruce's parliament, and of his son's tomb; of the line of the unfortunate Jameses and their queens; of Mary and Darnley; and of Charles, the last Stuart crowned within its walls!

J. S.

THE HOUSE OF WHISPERS.

CHAPTER VII.—CONTAINS CURIOUS CONFIDENCES.

A WEEK had gone by. Stewart, the lean, thin-faced head-keeper, who spoke with such a strong accent that guests from the South often failed to understand him, and who never seemed to sleep, so vigilant was he over the Glencardine shootings, had reported the purchase of a couple of new pointers.

Therefore, one morning Lady Heyburn and her constant cavalier, Flockart, had walked across to the kennels close to the castle to inspect them.

At the end of the big, old-fashioned stable-yard, with gray stone outbuildings ranged down either side, and the ancient mounting-block a conspicuous object, were ranged the modern iron kennels full of pointers and spaniels. In that big, old, paved quadrangle, the cobbles of which were nowadays stained by the oil of noisy motor-cars, many a Graham of Glencardine had mounted to ride into Stirling or Edinburgh, or to drive in his coach to far-off London. The stables were now empty, but the garage adjoining, whence came the odour of petrol, contained the two Glencardine cars, besides three others belonging to members of that merry, irresponsible house-party.

The inspection of the pointers was a mere excuse on her ladyship's part to be alone with Flockart. She wished to speak with him, and with that object suggested that they should take the by-road which, crossing one of the main roads through the estate, led through a leafy wood away to a railway level-crossing half a mile off. The road was unfrequented, and they were not likely to meet any of the guests, for some were away fishing, others had motored into Stirling, and at least three had walked down into Auchterarder to take a telegram for their blind host.

'Well, my dear Jimmy,' asked the well-preserved, fair-haired woman in short brown skirt and fresh white cotton blouse and sun-hat, 'what have you discovered?'

'Very little,' replied the easy-going man, who wore a suit of rough heather-tweed and a round cloth fishing-hat. 'My information is unfortunately very meagre. You have watched carefully. Well, what have you found out?'

'That she's just as much in love with him as before—the little fool!'

'And I suppose he's just as devoted to her as ever—eh?'

'Of course. Since you've been away these last few days he's been over here from Connachan, on one pretext or another, every day. Of course I've been compelled to ask him to lunch, for I can't afford to quarrel with his people, although I hate the whole lot of them. His mother gives herself such airs, and his father is the most terrible old bore in the whole country.'

'But the match would be an advantageous one—wouldn't it?' suggested the man strolling at her side, and he stopped to light a cigarette which he took from a golden case.

'Advantageous! Of course it would! But we can't afford to allow it, my dear Jimmy. Think what such an alliance would mean to us!'

'To you, you mean.'

'To you also. An ugly revelation might result, remember. Therefore it must not be allowed. While Walter was abroad all was pretty plain sailing. Lots of the letters she wrote him I secured from the post-box, read them, and afterwards burned them. But now he's back there is a distinct peril. He's a 'cute young fellow, remember.'

Flockart smiled. 'We must discover a means by which to part them,' he said slowly but decisively. 'I quite agree with you that to allow the matter to go any further would be to court disaster. We have a good many enemies, you and I, Winnie—many who would only be too pleased and eager to rake up that unfortunate episode. And I, for one, have no desire to figure in a criminal dock.'

'Nor have I,' she declared quickly.

'But if I went there you would certainly accompany me,' he said, looking straight at her.

'What!' she gasped in quick dismay. 'You would tell the truth and—and denounce me?'

'I would not; but no doubt there are others who would,' was his answer.

For a few moments her arched brows were knit, and she remained silent. Her reflections were uneasy ones. She and the man at her side, who for years had been her confidant and friend, were both in eminent peril of exposure. Their relations had always been purely platonic; therefore she was not afraid of any allegation against her honour. What her enemies had said were lies—all of them. Her fear lay in quite a different direction.

Her poor, blind, helpless husband was in ignorance of that terrible chapter of her own life—a chapter which she had believed to be closed for ever, and yet which was, by means of a chain of unexpected circumstances, in imminent danger of being reopened.

'Well,' she inquired at last in a blank voice, 'and who are those others who, you believe, would be prepared to denounce me?'

'Certain persons who envy you your position, and who, perhaps, think that you do not treat poor old Sir Henry quite properly.'

'But I do treat him properly!' she declared vehemently. 'If he prefers the society of that chit of a girl of his to mine, how can I possibly

help it? Besides, people surely must know that, to me, the society of a blind old man is not exactly conducive to gaiety. I would only like to put those women who malign me into my place for a single year. Perhaps they would become even more reckless of the *convenances* than I am!'

'My dear Winnie,' he said, 'what's the use of discussing such an old and threadbare theme? Things are not always what they seem, as the man with a squint said when he thought he saw two sovereigns where there was but one. The point before us is the girl's future.'

'It lies in your hands,' was her sharp reply.

'No; in yours. I have promised to look after Walter Murie.'

'But how can I act?' she asked. 'The little hussy cares nothing for me—only sees me at table, and spends the whole of her day with her father.'

'Act as I suggested last week,' was his rejoinder. 'If you did that the old man would turn her out of the place, and the rest would be easy enough.'

'But'—

'Ah!' he laughed derisively, 'I see you've some sympathy with the girl after all. Very well, take the consequences. It is she who will be your deadliest enemy, remember; she who, if the disaster falls, will give evidence against you. Therefore, you'd best act now, ere it's too late. Unless, of course, you are in fear of her.'

'I don't fear her!' cried the woman, her eyes flashing defiance. 'Why do you taunt me like this? You haven't told me yet what took place on the night of the ball.'

'Nothing. The mystery is just as complete as ever.'

'She defied you—eh?'

Her companion nodded.

'Then how do you now intend to act?'

'That's just the question I was about to put to you,' he said. 'There is a distinct peril—one which becomes graver every moment that the girl and young Murie are together. How are we to avert it?'

'By parting them.'

'Then act as I suggested the other day. It's the only way, Winnie, depend upon it—the only way to secure our own safety.'

'And what would the world say of me, her stepmother, if it were known that I had done such a thing?'

'You've never yet cared for what the world said. Why should you care now? Besides, it never will be known. I should be the only person in the secret, and for my own sake it isn't likely that I'd give you away. Is it? You've trusted me before,' he added; 'why not again?'

'It would break my husband's heart,' she declared in a low, intense voice. 'Remember, he is devoted to her. He would never recover from the shock.'

'And yet the other night after the ball you said you were prepared to carry out the suggestion, in order to save yourself,' he remarked with a covert sneer.

'Perhaps I was piqued that she should defy my suggestion that she should go to the ball.'

'No, you were not. You never intended her to go. That you know.'

When he spoke to her this man never minced matters. The woman was held by him in a strange thraldom which surprised many people; yet to all it was a mystery. The world knew nothing of the fact that James Flockart was without a penny, and that he lived—and lived well, too—upon the charity of Lady Heyburn. Two thousand pounds were placed, in secret, every year to his credit from her ladyship's private account at Coutts's, besides which he received odd cheques from her whenever his needs required. To his friends he posed as an easy-going man-about-town, in possession of an income not large but sufficient to supply him with both comforts and luxuries. He usually spent the London season in his cosy chambers in Half-Moon Street; the winter at Monte Carlo or at Cairo; the summer at Aix, Vichy, or Marienbad; and the autumn in a series of visits to houses in Scotland.

He was not exactly a ladies' man. Courtly, refined, and a splendid linguist, as he was, the girls always voted him great fun; but from the elder ones, and from married women especially, he somehow held himself aloof. His one woman-friend, as everybody knew, was the flighty, go-ahead Lady Heyburn.

Of the country-house party he was usually the life and soul. No man could invent so many practical jokes or carry them on with such refinement of humour as he. Therefore, if the hostess wished to impart merriment among her guests she sought out and sent a pressing invitation to 'Jimmy' Flockart. A first-class shot, an excellent tennis-player, a good golfer, and quite a good hand at putting a stone in curling, he was an all-round sportsman who was sure to be highly popular with his fellow-guests. Hence up in the north his advent was always welcomed with loud approbation.

To those who knew him, and knew him well, this confidential conversation with the woman whose platonic friendship he had enjoyed through so many years would certainly have caused greatest surprise. That he was a schemer was entirely undreamed of. That he was attracted by 'Winnie Heyburn' was declared to be only natural, in view of the age and affliction of her own husband. Cases such as hers are often regarded with a very lenient eye.

They had reached the level-crossing where, beside the line of the Caledonian Railway, stands the mail-apparatus by which the down-mail for Euston picks up the local bag without stopping, while the up-mail drops its letters and parcels into the big.

strong net. For a few moments they halted to watch the dining-car express for Euston pass with a roar and a crash as she dashed down the incline towards Crieff Junction.

Then, as they turned again towards the house, he suddenly exclaimed, 'Look here, Winnie. We've got to face the music now. Every day increases our peril. If you are actually afraid to act as I suggest, then tell me frankly and I'll know what to do. I tell you quite openly that I have neither desire nor intention to be put into a hole by this confounded girl. She has defied me; therefore she must take the consequences.'

'How do you know that your action the other night has not aroused her suspicions?'

'Ah! there you are quite right. It may have done so. If it has, then our peril has very considerably increased. That's just my argument.'

'But we'll have Walter to reckon with in any case. He loves her.'

'Bah! Leave the boy to me. I'll soon show him that the girl's not worth a second thought,' replied Flockart with nonchalant air. 'All you have to do is to act as I suggested the other night. Then leave the rest to me.'

'And suppose it were discovered?' asked the woman, whose face had grown considerably paler.

'Well, suppose the worst happened, and it were discovered?' he asked, raising his brows slightly. 'Should we be any worse off than would be the case if this girl took it into her head to expose us—if the facts which she could prove placed us side by side in an assize-court?'

The woman—clever, scheming, ambitious—was silent. The question admitted of no reply. She recognised her own peril. The picture of herself arraigned before a judge, with that man beside her, rose before her imagination, and she became terrified. That slim, pale-faced girl, her husband's child, stood between her and her own honour, her own safety. Once the girl was removed, she would have no further fear, no apprehension, no hideous forebodings concerning the imminent future. She saw it all as she walked along that moss-grown forest-road, her eyes fixed straight before her. The tempter at her side had urged her to commit a dastardly, an unpardonable crime. In that man's hands she was, alas! as wax. He poured into her ear a vivid picture of what must inevitably result should Gabrielle reveal the ugly truth, at the same time calmly watching the effect of his words upon her. Upon her decision depended his whole future as well as hers. What was Gabrielle's life to hers? asked the man point-blank. That was the question which decided her—decided her, after long and futile resistance, to promise to commit the act which he had suggested. She gave the man her hand in pledge.

Then a slight smile of triumph played about his cruel nether lip, and the pair retraced their steps towards the castle in silence.

(To be continued.)

A GIGANTIC SCOTTISH UNDERTAKING.

In the autumn of 1905 the initial step was taken in what is undoubtedly the greatest industrial enterprise that has yet penetrated the Highlands of Scotland. From time to time different schemes have been projected for the establishment of industries in the Western Highlands, but they all pale into comparative insignificance before the gigantic undertaking now in course of development at the head of Loch Leven, in Argyllshire.

The potential value of the enormous volume of water which for centuries has been allowed to run to waste in this remote, untravelled, and picturesque region of the north is practically incalculable, and it is surprising, in an age which has witnessed so many remarkable schemes for harnessing the forces of nature, that so little advantage has hitherto been taken of this dormant factor as a means of motor-power. Scientific and mechanical experts have, nevertheless, been for some years past seriously considering the question of utilising the immense water-resources of the district to generate electricity for manufacturing purposes. Thus it is that, encouraged no doubt by the successful results obtained from their aluminium works at the Falls of Foyers, in Inverness-shire, the British Aluminium Company, in conjunction with the Loch Leven Water and Electric Power Company, having acquired the water-rights at Kinlochleven, are now, at enormous expense, constructing a huge dam and factory for the purposes of their business.

Kinlochleven lies at the head of the narrow sea-arm, Loch Leven, which runs about eight miles east from Loch Linnhe at Ballachulish, in Argyllshire; and the site of this great industrial organisation is surrounded by the giant peaks of Mamore Forest to the north and the no less lofty mountains over Glencoe to the south.

Until the starting of these colossal hydro-electric works, comparatively few people knew much about Kinlochleven; many had not even heard the name before. For this lack of knowledge there was, however, a very reasonable excuse. Three years ago it was a lonely Highland glen, given over exclusively to sport, and inhabited only by a few gamekeepers and gillies. Far removed from the ordinary tourist tracks, its weird, silent solitudes of mountain, moor, and glen were rarely penetrated except by hunters a-chasing the deer; and in maps, gazetteers, guide-books, or railway time-tables the name of Kinlochleven was conspicuous by its

absence. To-day the red deer and the eagles look down in astonishment on the busy hive of industry that has sprung up in their ancient haunts; in fact, the transformation that has taken place within the last three years is comparable only to those magic effects in which the genii of the Arabian fabulists raised palaces in a night. A Highland solitude has been transformed into a busy town of close upon six thousand workers—a town which, when completed, will have urban advantages unknown to many other towns in the north of Scotland. It is built on the model-town system. Large, roomy, self-contained cottages, mostly of two-stories, they look very substantial, and are fitted up on thoroughly modern lines. Many are already occupied by the engineers and foremen of the works. The dwelling-houses and streets will be lit by electric light, and a water-supply equal to fifty gallons per head per day of the anticipated population is provided. A number of shops have already been opened, and the town is equipped, or about to be equipped, with a harbour, an electric railway, a custom-house, a post-office, a school, a hospital, a hotel, while the Church of Scotland has prepared plans for the erection of a church for the new community. The sewage system is of the latest character, with a septic tank; and a slaughter-house and destructor are also included in the scheme. Other additions to the amenities of this wonderful town will be recreation-rooms, public baths, and a park.

The colossal undertaking which has been the means of so completely transforming a lonely, isolated district into a thriving, enterprising community owes its inception to the unique natural advantages which Kinlochleven offered to the originators of the scheme. In the production of aluminium, which is now being used for a great variety of purposes where lightness and strength, durability, and freedom from rust are essential, a heat is required greater than can be got from an ordinary furnace, and these degrees of heat are readily obtained from electric furnaces. The cheapest way to make electricity is, of course, by water-power, and the promoters of this mammoth enterprise could not fail to be impressed by the rushing torrents and waterfalls which poured down the river Leven from the string of three lochs lying in the valley immediately north of Glencoe. These three lochs—bearing unpronounceable Gaelic names—are joined together by intervening waterways, and the ingenious idea was conceived of damming them all up, so that instead of having three comparatively small lochs they would have one immense reservoir nine miles in length, with an average width of over half a mile. The approximate capacity of this big loch—when completed it will be the largest artificial reservoir in Europe, if not in the world—will be about twenty thousand million gallons; and as it is situated in a district where the average rainfall is nearly one hundred and twenty inches per annum, there can be no dubiety with regard to an adequate supply of water.

Stoutly built of concrete masonry, the wall of the huge dam is three-quarters of a mile in length, with a width of sixty feet at the base, tapering up to fifteen feet at the top, and having a maximum depth of eighty feet. From the lower side of the dam the water will be led by a concrete conduit along the hill-face for about four miles, with a fall of about one foot in the thousand into a penstock chamber. The conduit is eight feet square, built entirely of reinforced concrete, and roofed over with slabs of the same material. Ample arrangements are provided for regulating the flow into the conduit, and the passage of the water will be controlled by valves of large size. Out of the penstock chamber the water will rush through fully a mile of gigantic steel piping—there are six pipes in all—down to the turbines that work the dynamo which will provide electricity for the furnaces and machinery of the new industrial colony.

The factory containing the turbines that all this water-power is to be used for driving covers an area of six hundred feet by four hundred feet, and there is besides a carbon factory which covers two hundred feet square. There are twelve turbines, and each will feed its own series of furnaces. From the power-house a huge concrete trench or culvert about thirty feet deep by fifteen wide carries away the exhaust water to the river which flows near by.

The pipes in use for the great pipe-track are being supplied by a German firm, and are brought from Hamburg direct by steamer to Kinlochleven. No British firm, it appears, was prepared to comply with the conditions imposed in regard to the manufacture of these pipes, and some idea may be had of the importance of the order thus lost to British trade from the fact that the total weight of pipes to be used will exceed ten thousand tons, and the steamer conveying the pipes from Hamburg will require to make over twenty trips before the order is completed, as owing to their bulk only one hundred and fifty pipes can be conveyed on each voyage. These pipes are not connected in the usual way by flanges, but by bolts, and the manufacturers send their own workmen from Germany to place them in position.

Experts who have visited Kinlochleven agree that this enormous pipe-track and the works at the dam represent the most marvellous piece of engineering accomplished in this or any other country for many years. The magnitude of all the operations, the colossal scale on which everything is being done, the completeness of the arrangements, and the boldness of the whole undertaking evoke the unstinted admiration and wonderment of all. Like all great schemes, of course, there have been difficulties and barriers of an almost insuperable nature to surmount; but they have only served to bring out the latent skill and determination of those at the head of affairs. Practically before a blow was struck, the inaccessibility of the site for the dam confronted them as a serious problem. There was only a footpath

along the shore from Ballachulish, thirteen miles from the projected dam; and from the head of the loch a portion of a rough old foot-trail made by General Wade followed the river-side east for a mile or two before turning to the south to lose itself among the corries, and, having soared one thousand seven hundred feet in air, descend on the Devil's Staircase of Glencoe. Between this footpath and the foot of Loch Inbhar, where the dam was to be made, lay three or four miles of untracked moor and hill.

Water-transport of material by Loch Leven obviously suggested itself as the most feasible, and a cargo-steamer sailed up the loch from Ballachulish to test its possibilities in this connection. Halfway up the loch, at Caolasnancon, there is a part, judging with the eye, not any wider than the Tay at Perth, and most appropriately named the Dogs' Narrows. Here, it was found, there were only three feet of water at low-tide. Undismayed by these disabilities, the projectors of the scheme did not deviate one hair's-breadth from their undertaking. They widened the channel at Caolasnancon, and deepened it to ten feet at dead low-tide, removing more than half a million tons of dredgings, and rendering the loch navigable to its head by vessels of considerable draught.

Another great difficulty that had to be overcome was the conveyance of material over the very mountainous country that intervenes between the sea and the dam. There was only a track which ran parallel to the route of the great conduit, but it was quite unsuitable for wheeled traffic, so that at the outset every scrap of material used for the building of the workmen's huts at the dam and for the commencement of the work had to be carried by pack-saddle horses, or men carried the stuff on their shoulders over hill and moor for six weary miles. The ingenuity of our modern engineers solved the problem of this slow, tortuous mode of transport, and a great aerial ropeway—Blondin, it is familiarly called—was constructed from the pier at Kinlochleven to the dam, with spans varying, according to the contour of the country, from five hundred to one thousand three hundred and ninety feet. It is an endless cable of powerful steel wire-rope twelve miles long, and over it all the materials for the work and the provisions for the men have since been conveyed. The enormous value of this means of transit to the contractors may be estimated from the fact that in the dam there will be four hundred thousand cubic yards of concrete, forty-eight thousand yards in the conduit, and over forty thousand yards in the pipe-track, representing some fifty thousand tons of cement alone, not to mention coal, wood, lime, sand, iron, and the food for the big army of navvies there employed. The ropeway conveys about five hundred tons of material daily, and is worked by electricity.

The power for the ropeway, and also the electric current for the working of cranes, drills, &c., are supplied by a small temporary power-scheme possessing features resembling very much those of the parent project. Power is obtained from the falls on the Leven River; there is a conduit of about a mile in length, with a pipe-line and two turbines—the whole being capable of developing nearly one thousand horse-power. The current, after being generated at the power-station, is fed to the dam by eight copper cables, being thereafter distributed to the various machines employed in the undertaking.

To facilitate working, the contractors have connected their different centres of operation by telephones, and in a district minus thoroughfares such an adjunct is almost indispensable. All materials, plant, stores, &c. are landed by steamer at the company's pier at Kinlochleven, and a motor-boat service three times a day keeps the community in touch with Ballachulish.

It is expected that the works will take out thirty-five thousand electrical horse-power, and when the dam is complete and the factory in full working order, which it is expected will be the case early in 1909, there will be permanent employment for about fifteen hundred men, which means that there will be a population of over five thousand in the district. The whole scheme will probably cost the greater part of a million pounds before completion.

Many enterprising projects have of recent years been formulated with the idea of stemming the tide of rural depletion; but it may safely be affirmed that this gigantic electrical undertaking at Kinlochleven is by far the most important contribution of the engineer towards the solution of the 'back to the land' problem, and it is confidently hoped that it may be the pioneer of many similar ventures in the waste places of the kingdom.

The principal contractor is Sir John Jackson, Ltd., Westminster, who is constructing the dam and the hydraulic works; and Messrs M'Laughlin & Harvie, Belfast, are the contractors for the erection of the village and the factories.

THE LUCK O' THE SPEY.

CHAPTER III.

YOU are to picture the broadening river clasping green islets in Badenoch, a wind-swept strath, above it the scarred foreheads of the Cairngorms. There the Spey welcomes the deer at dawn; under the moon the quiet otter ripples her silent pools. To-day her clear depths return, enhanced, the chasing clouds; to-morrow a thousand amber freshets brim her noble banks. She is April in her inconstant delights, June in the bosom of her placid crystal sincerities.

Looked at afar, from the hills, like a drop of ink in a strong brown hand, a loch in Badenoch neighbours the river, linked to it by the silver chain of a leisurely stream. At the time of the floating of timber down-stream a rough dam was built of huge pine-beams, gagging the mouth of the loch. Against this lay half-a-dozen rafts or 'floats,' as they were called, made of newly hewn tree-trunks. The lone haunt of the heron and the red deer was transformed. On one side of the loch a thousand pines still raised their dark spears; on the other, great gaps yawned in the woods, where the axes had been ringing. On the shingle piles of tree-trunks lay ready to be made into rafts; scores of workmen were busy pruning them; patient-eyed horses strained at the heavy loads, shouting drivers and cracking whips; Gaelic oaths and snatches of song, loud and regular clink of axes in the woods, forges roaring, eerie echoes reverberating among the mountains, wheels crunching the stones; now a louder crash, as some stately pine said farewell to the hill and to life with a cry—all making a scene of tingling vitality, to the accompaniment of musical waters on the long keyboard of the shingle.

A group of men lay on the grass near the dam, awaiting orders. Soon a shout brought them to their feet, and the 'ganger' stood beside them. He was a man of experience in the ways of the motley crowd in the Spey 'floating' days, and therefore of few words. He presented six feet of Gordon tartan—hose, kilt, and doublet, the whole crowned by a flaming circlet of red hair and whiskers. He looked at the men with a gimlet and choleric blue eye, and from the red nimbus issued the following, in a voice with the timbre of a raven's:

'Six rafts ready at wance. Fowre men each for the three big rafts, twa for the twa licht anes. Ian, Donal' Fraser, an' you, Lang Dram, wull choose three men to gang wi' ye. Masel' and Alasdair Grant take the twa licht rafts wi' a man each. Mak' the river's mouth in twa days. Poach nane an' drink less, or ye needna show your faces here again.' Exit the 'ganger.'

These crisp and decisive words left little room for discussion; and, after a few seconds' jabbering together in the Gaelic, the men chose their companions, leaving Watty Douglas, the Lowlander, and an unkempt-looking hillman for the two light rafts.

The 'ganger' came back. 'Ready? Good!' said he.—'Now, Alasdair, tak' ye Watty Douglas wi' ye, an' I'll tak' this chiel,' jerking a grimy thumb at the hillman. 'He's no' muckle to look at, but he kens the river.'

Alasdair hesitated. Two days with the Lowlander, with a man whose hated image he was trying to blot out of his heart! 'I—I—will you no' take Douglas?' he stammered.

The 'ganger' stared.

'The lad's strong enough, an' willin',' he answered.

'I'm no' willin' if Grant thinks ill o' my company,' Douglas blurted out. 'Maybe I think as little o' his.'

The other man's red beard bristled.

'Be —— to both o' ye!' said he, turning his back on them with a sudden burst of anger. 'Tak' my orders, an' that licht raft doon Spey, or draw your pay an' let me see the last o' ye.'

The two men moved sulkily off to their raft, for a rough and effectual discipline reigned.

The pine-trunks in the middle of the beam across the loch's outlet were unfastened, and one by one the huge 'floats' glided slowly through, like uncouth living monsters, amid a babel of shouted orders from the shore.

It was late in the afternoon, with a fitful sun throwing long spears of yellow light through the dark woods on the silent hillside snows, and on the long dark waves of peat-moss. Where, in summer, the royal purple of the mountains, the gold of the whin-blossom, the virgin white of the wild cherry, the bracken's dark-green plaid radiated a poem, now the dying February sun retreated from brown heather and dark stretches of sombre moorland. A solitary curlew called sadly in the gathering darkness. In the swift coming of evening, the gloaming met the shadows creeping round the gaunt arms of the firs, creeping round the Cairngorms till the hills faded into gray, into mists, into nothing, save where a white, ghostly shoulder gleamed for an instant against a passing cloud. The evening fell chilly. There was a shudder in the air.

The last raft had long since swung out on the river. It was manned by Alasdair and Watty Douglas. Alasdair stood, with his dog and comrade, Cù Math, beside him, in the front of the raft, boat-hook in hand, on the alert for too near an approach to shallows, hidden rocks, or flotsam, keeping the craft in mid-stream. Douglas sat on the piled-up trunks, idly watching the dim banks

float slowly past. The two men exchanged few words, Alasdair breaking the silence now and then with an order. Night had fallen. A star or two blinked over the pine-tops. Alasdair tried to keep his thoughts from the girl, from the Lowlander, from a hundred tortures of jealousy. Up at the loch, with the incessant hard work of loading the rafts, some relief had come to him; but now, in the inaction of the quiet night, the dull gnawing came back to his heart. He watched the pines, black and mysterious against the faint mist of the river, their ranks, as it seemed, slowly circling as he floated past.

The night sped on. Douglas yawned loudly and stretched himself. He was tired of the silence, the eternal *swish, swish* of the current, the grumble of the raft. The quiet jarred on his volatile surface. He was incapable of a passion like the Highlander's, his love-affair with Mary springing from vanity and cheap excitement, a rushlight compared with the flame in Alasdair's heart. He looked at the silent Highlander without even remotely understanding the strange blend in his blood of child, savage, and gentleman. Perhaps, because of this, he was a little afraid of him, in spite of his bravado in 'The Norway Lass.' However, he must speak. He would chaff this sulky Highlander into talking. His was the nature to prefer bickering with an enemy to silence even with a friend.

'It's a dark nicht,' he began.

'It is,' answered the other impassively.

Silence again. Evidently there was nothing to be got out of meteorological observations. He was vaguely angry, and took a side-look at Alasdair.

He began again. 'I'm fair sick o' this wark. Naethin' but hammerin' an' haulin' at trees, then floatin' atween thae everlastin' hills. It's a wonder the likes o' you fashes wi' it.'

The Highlander kept silence.

'As for me,' continued Douglas, with another stealthy look, 'I wadna bide here twa days gin I hadna anither reason forby the wark. There's bonny lassies on Speyside.'

'Keep your reasons to yourself, then,' said Alasdair, his gorge rising at the other's smirk. No one but a fool would have mistaken the unnatural quiet and steadiness in his voice.

'As I was sayin',' went on Douglas blindly, 'when ye were sae ceevil as to interrupt me, there's bonny lassies on Speyside, an' wan in parteeclar.' He leered, with the sickening leer of an underbred squire of dames. The men's eyes met, and the vulgarian's blinked and fell under Alasdair's steady gaze, but an empty bravado seized him. He still went on blindly, his voice shrilling like a male virago's.

'Nae need to glower at me like that. Fine I ken what ye're thinkin' o'. Man, ye're welcome to the lass on the hill. Faugh! I've a lass in Fife, an' anither in Leith; an' as for your licht-o'-love on Speyside'——

'Stand up, hound, and take the word back!' The Highlander was within two paces of him, his face white, his voice shaking.

Douglas rose quickly. Something told him that he had been trifling with a volcano. It was not yet too late, he thought.

'Man, Grant'—— he began.

'Take it back, or you'll die like a rat!' thundered the other.

The Lowlander hesitated, and then made a tremendous mistake. He did the most dangerous thing possible to a type like Alasdair. He laid a nervous, wheedling hand on the Gael's shoulder; and in an instant revulsion from his touch, the instinct of insulted physical strength, pent-up hatred, routed all other feelings, and left Alasdair a fighting savage. He closed with Douglas instantly and without a word. The Lowlander hit out wildly, but his throat was in the other's hand. He was shaken like a rat, and then whizzed through the air to the other end of the raft, where he lay, one leg trailing in the water. The other stood over him, panting. The cold of the stream kept Douglas's sagging wits afloat, and to save himself from slipping into the swift river he threw his arms round Alasdair's ankles. The sudden clasp brought him down; and as Douglas managed to raise himself on one knee his hand touched the other's skean-dhu.

Both men rose, and the little black knife dropped with a rattle on the raft close to the Lowlander's feet. In a trice he seized it, and made a vicious downward stab. The blade cut the sleeve of Alasdair's doublet, and a spurt of blood drenched his forearm. But the skean-dhu caught for one instant in the doublet, the Highlander's hand was on Douglas's wrist, and they fought like wild beasts for the knife. Now it hovered in mid-air between them; now it came slowly, slowly, the point towards him, as Douglas's arm grew weaker. Alasdair's free hand was feeling again for his throat. Douglas was growing dizzy, a red mist in his eyes, his breath coming in gasps. Making a last effort, he flung himself forward. The mere momentum would not have shaken the other, but Alasdair's foot caught in the uneven surface of the raft; he fell backwards, striking his head, and lay stunned. Douglas fell over him heavily, and the knife, point uppermost, went to the hilt in the Lowlander's throat. He staggered to his feet, beating the air twice with his bloody hands; swaying gently, he dropped to his knees, then to all-fours at the edge of the raft. The water looked very dark. Everything was very dark. He struggled slowly to his feet as the blackness of coming death put out the stars, then called aloud once on God, and fell into the deep silence of the swift mid-stream.

Alasdair lay stunned on the raft, the collie, Cù Math, licking his face and calling on him in frantic, pitiful dog-language. For five minutes or more he lay, and then came back to his senses. Ah! where was Douglas? He rose unsteadily and stared into the dark. A thin trickle of blood ran down his

right hand. The skean-dhu had just grazed his arm. He ran his shaking hands over his doublet. One side was wet and warm, and in a flash cold beads of sweat stood out on him. The skean-dhu! —where was it? The Lowlander!—where was he? He searched the raft as thoroughly as he could in the dark, finding nothing. Ah, he remembered! For long he stood, wondering when the first streak of dawn would come, his nerves taut, a prey to a hundred maddening thoughts, his eyes fixed on the river. The river! It was talking, talking all the time. He knew now where Douglas was! He heard again, as he thought, the charm old Morag had chanted:

> The Luck o' the Spey to the fighting Grants,
> Save to them who strike for a worthless cause.

The Luck o' the Spey would be—nay, was—his. 'A worthless cause!' No. He thought of the lass on the hill, and Douglas's jeer braced him a little. Still, would the dark river give up his secret? He shuddered. Would the dawn never come? He must keep the raft more into mid-stream. It was getting too close to the slow-moving panorama of the dark shore. The hoarse bark of a hill-fox startled him like a sudden challenging voice. He heard eerie voices from the woods. The very splash of the stream tormented him, for to his type, just as much as to any Greek of old, the mountains, the woods, and the earth were full of life, the Little People danced under the moon, the Kelpie lurked at the ford. A hundred stories of creatures peering from the underworld crowded over him as he looked, smothering a cry when Cù Math, tired of being forgotten, thrust a cold nose into his hand, sending his nerves jangling anew.

Great heavens! would the dawn never come? He put an arm round the collie, and together they waited, the dog's eyes questioning the trouble in his master's.

Leaden minutes passed. Gradually a faint film rose from the waters. The banks and trees took vague shapes. The gray light crept slowly into the sky. A few paling stars saw the man washing blood from himself and the raft. Then he stood up and watched the coming of dawn. The sky's face was mirrored here and there in silent pools. Now a dark, abrupt scaur loomed in the gathering light, heralding a frank open space between the hills. He could see the sinuous run of a hill-burn and hear its friendly sound. Deeper water came, and with it shadows of pine and fir, and the gracious arms of the birches at the green edge of a still stretch of the river. The hills and the sky were shut out, save where a shaft of early morning light lanced through, as in the hush of some dim cathedral aisle—a still, tree-arched sanctuary. An early bird sang; the morning air stirred—a grave Gregorian chant in the pines. A dry sob shook him as he watched. The collie nestled closer.

An hour passed. Up the glen the brave, dark shoulder of Ben Rinnes loomed, towering over his henchman, Ben Aigen. Above the raft a cascade of dark pines broke at the river's bank into the spray of a hundred gleaming birches. The morning was at hand. In the middle light the hill-tracks became quiet streets. Stately avenues and open spaces appeared. The man on the raft knew and loved every corner of the glens, and it came to him, with a horror of himself, that now they were peopled by awful and accusing shapes. Phantom towers and battlements arose. The terraces of pines joined hands, climbing upwards to the crest, where they hung in the silver point of the morning light, inexpressibly delicate, poised on the pearly skyline, the crowning pinnacles of a silent faerie city of green spires. The pale moonlight o'er Melrose never wrought such magic.

Soon a new voice sang in the stream as it neared the sea. Alasdair heard it, and stood alert in front, as the raft swam through loud-voiced rapids into dark pools starred by sailing white bells of foam. A murmur—steady, unmistakable—stole up-stream to the listening river, and she answered the call of the North Sea in the strong, glad voice of her hurrying current.

The harbour-beacon blinked in the distance. Riding-lights of ships shone, tawdry swinging yellow dots in the early light. A mast stood out, then another and another; and Alasdair saw the sleeping village lying like a little wisp of gray smoke at the river's mouth, and, beyond, the long tireless rollers crumbling into white on the beach.

There was no one astir except a 'floater' on night-duty when the raft swung alongside the wharf.

'Mornin', Alasdair,' he said. 'Are ye alane? Where's Douglas?'

'He left the raft at Glenduar,' said Grant, without looking at him.

'Will he be after the deer, think ye?' said the other, busy with the tackle.

'I do not know. I did not see him leave,' said Alasdair. Then he went to his lodging in 'The Norway Lass,' and lay with hot, sleepless eyes. Was it a mocking voice from the quiet street that reached him? The hoarse voice of the old watch on his rounds was calling, 'The skriegh o' day! A fine mornin'. All 's well.'

(To be continued.)

REPATRIATION OR EXILE.

IN the February part of *Chambers's Journal* (1908) Lady Napier gives a pathetic description of the wholesale depopulation of the Western Highlands, and clearly depicts the almost insuperable difficulties of getting the people back to the land in such a manner as to realise the ideals of that new school of enthusiasts who hold that the simple and strenuous life is the best and happiest for all, alike for the peer or the peasant, irrespective of wealth or position. As far as the townspeople are concerned, although the noise, vulgarity, and squalid surroundings of great cities have intensified their appreciation of the beauties of nature, yet it is lamentably true that these sons and daughters of the towns have to a great extent lost the primeval instincts which enable man to face the elements and wrest a living from the soil in spite of the most unfavourable conditions. Worse still, the artificialities of life have taken so firm a hold upon their imagination that a continuous residence in the country seems insufferably monotonous after the glare of the footlights, the display of tawdry finery in the shop-windows, the ceaseless rush and clatter of the street traffic, and, last but not least, a hopeless infatuation for the make-believe and caricatures of life as depicted in plays of questionable merit and still more doubtful morals. The result is only too often a stage-struck mental attitude, which, while scoffing at the real, greedily swallows all the fictions in the universe, an ever-present self-consciousness which impels people to affect to be anything in the world except their natural selves, and a levity which respects neither gray hairs nor the grave. Then, again, the city worker is a specialist, often indeed marvellously skilful in his own department, but quite useless at any other occupation; while, on the contrary, the tiller of the soil must be an all-round man, capable of turning his hand to anything that comes along; in fact, he possesses a delicacy of sight and touch, a shrewd practical knowledge of the elements of life, and a capacity for resisting or turning to advantage the buffets of adverse circumstances, in most cases only realised and appreciated by the amateur after he has lost his money in the effort to revert to the simple life and make a living from the land. In his first enthusiasm, he is apt to forget that in order to get a sure footing in a highly skilled profession—really never mastered from the cradle to the grave—it is necessary to go slow for a time, working by sure and well-established methods, rather than attempting the seductive short-cuts of experimental processes, which in nine hundred and ninety-nine cases out of a thousand prove to be a failure. This contempt for the acquired and hereditary qualifications of the countryman is the direct cause of most reverses when people try to hark back to health and happinesss amidst the charms of fresh air and country freedom.

This question is of vital importance to the homeland. In case of war any serious interference with our foreign trade would place the price of foodstuffs beyond the reach of the masses. The inevitable political and social consequences are more easily imagined than described: the misery and starvation of the poor, the fierce desperation of a million hungry workmen whose wives and children are dying of want. Possibly the Government might do something to stave off defeat by the establishment of national granaries and the distribution of the necessaries of life. To such a state, then, has Great Britain been reduced by the celebrated Corn Laws, which converted the agriculturists of the country into wretched factory operatives. The fields which were continuously cultivated for a hundred generations have been turned into sheepwalks, and the finest recruiting grounds in the Empire have been largely converted into deer forests for the occasional amusement of the newly rich; the feudal castles of the Middle Ages are now replaced by the mansions of wealthy shopkeepers and manufacturers, who at most merely pass a few months of the year at their country houses to vary the monotony of city life.

What is the remedy? The question is often asked, 'Does any one really want to go back to the land?' We can safely say that under satisfactory conditions many would return to their native land, certainly quite sufficient to develop the agricultural possibilities of the country. Even the British colonies would furnish a large contingent of people who have amassed a competence, which they would prefer to enjoy in the old country. But from a personal appreciation of the circumstances, I am inclined to think most would come from foreign lands. There are thousands of fairly well-to-do British settlers abroad who are naturally loath to bring up their children as foreigners. They have before their eyes every day a practical demonstration of just what it means. Firstly, the language is lost or forgotten, and gradually the traditions and pride of race fade away before the influence of an uncongenial environment. Then comes final annihilation by the fusion of blood and hereditary characteristics with the irresistible majority. To make matters worse, there is frequently a tendency to assimilate the vices of both races rather than their peculiar virtues. Well, the old land may take advantage of this state of affairs if it chooses. Most of us, still holding our interests in the land of our adoption, cannot afford to buy palatial mansions and large landed estates; and, at the same time, while recognising the many sterling qualities of the British rustic, the conditions of ordinary village life do not

appeal to us. Returning wanderers to Albion's shores mostly complain of the lack of privacy and want of scope. They say you are hemmed in on every hand by vulgar posters and notices that trespassers will be prosecuted. To use a colonial expression rather forcible than elegant, there is not room anywhere to swing a cat around by the tail. The only remedy is the acquisition of small blocks of from twenty to a few hundred acres in rural districts. A few acres of arable land in mountain valleys, with free access to barren moors, which are of no use to any one, would content most of us. The subdivision of the country into large estates at present makes it next to impossible to secure such holdings in the way of purchase. The advantages to the motherland are obvious. Millions of money derived from abroad would be spent in Britain. Many settlers with special pioneering knowledge would certainly reclaim large areas of waste lands, and by the introduction of new ideas or more effective methods in process of agriculture might be expected to give an additional impetus to home production. Secondly, they would always give employment to a large amount of labour in the way of building, the laying out of orchards and parks, and the cultivation of ordinary farm lands, having a better chance of meeting foreign competition than the men who are quite dependent for a living upon the small margin remaining to their credit after paying all expenses. So, if it may be sometimes wise to speed the parting emigrant on his way to other lands in search of the competence he cannot gain at home, it is at least equal wisdom to give him a hearty welcome on his return, to make him feel that he is really returning home, and to recognise the fact that his cosmopolitan education and wider experience of the world may be of incalculable service to his motherland. The increase of the race must always settle in new countries, but ancestral and historic associations should ever attract sufficient population to the old cradleland for the education and training of new blood for the conquest and colonisation of far countries beyond the seas.

To put the matter more plainly, it is extremely desirable in many cases that people of British blood should be brought up and educated at home before taking up their careers in the countries where their lot is likely to be cast. There is something radically wrong in Britain in these matters. The returned wanderer in many—perhaps most—cases finds the conventionalities of life somewhat trying, and usually returns to his adopted country. In Italy, on the contrary, although a quarter of a million of Italians emigrate to North and South America every year, a large proportion return to end their lives in their native land, and enormous sums are remitted constantly by the exiles from home. In France the state of affairs is very much the same, except that few French people ever care to emigrate at any time.

The contention of the writer, then, amounts to this: that upon economic and political grounds it is extremely desirable to encourage in every possible way a constant stream of returning adventurers from distant lands, by making desirable lots of land easily obtainable in the way of purchase, and by improving the facilities for recreation and social intercourse in country districts. With an ideal state of society, all waste lands should be open to the public as a vast national park, preserved from acts of vandalism by rigorous administrative arrangements. In this manner the surplus workers of the great centres might also be attracted by the health and charms of a country life.

With this object in view, some reforms are necessary in the educational department. As I take it, the primary object of public instruction should be in every case to train the boy or girl as good and useful members of society, and this can only be possible after teaching them first how to earn an honest living, and, secondly, all the decorative accomplishments which can be acquired in the time available for the purpose. It is simply criminal to permit children to grow up without any knowledge of the practical aspects of life, and then turn them loose in the world to fight the battles of strife and competition without being gradually inured to the conditions of such work during their childhood. What wonder that thousands go wrong under the strain? And what it really means can only be told by those who have been through the process. In Germany the idea of out-of-door schools is gaining ground. Certainly a few hours each day spent in technical training would produce excellent results, physically and intellectually. A knowledge of the first principles of agriculture would give wholesome and healthy development alike to mind and body. The youth with a practical education of this kind need never go very far wrong. He can always at least find some spot of earth where the plough will turn him in a decent living. Model farms in every district would also be of great assistance to amateurs, and scientific experiments are every day extending the range and scope of agriculture. In the United States the authorities are more alive to these matters than rulers anywhere else, having their agents exploring China and the farthest corners of the earth in the hope of discovering improved methods of working, or of finding new plants of commercial value suited for acclimatisation in their own country; also, in search of the best varieties of cereals and other cultivated crops. Highly satisfactory results have already been obtained. For example, the yield of rice in the Southern States has been almost doubled by the adoption of Japanese seed and methods of planting.

In conclusion, it is safe to say that if the powers that be really wish the people back on the land, they can easily realise the ideal of the latest reformers of the twentieth century.

THE GRIP IN DEEP HOLE.

By CHARLES G. D. ROBERTS.

THE roar of the falls, the lighter and shriller raging of the rapids, had at last died out behind the thick masses of the forest as Barnes worked his way down the valley. The heat in the windless underbrush, alive with insects, was stifling. He decided to make once more for the bank of the stream, in the hope that its character might by this time have changed so as to afford him an easier and more open path. Pressing aside to his left, he presently saw the green gloom lighten before him. Blue sky and golden light came low through the thinning trees, and then a gleam of unruffled water. He was nearing the edge now, and because the underbrush was so thick about him he began to go cautiously.

All at once he felt his feet sinking, and the screen of thick bushes before him leaned away as if bowed by a heavy gust. Desperately he clutched with both hands at the undergrowth and saplings on either side; but they all gave way with him. In a smother of leafage and blinding, lashing branches he sank downwards—at first, as it seemed, slowly, for he had time to think many things while his heart was jumping in his throat; then, shooting through the lighter, bushy companions of his fall, and still clutching convulsively at those upon which he had been able to lay his grasp, he plunged feet first into a dark water.

The water was deep and cold. Barnes went down straight and clear under, with a strangled gasp. His feet struck with some force upon a tangled, yielding mass, from which he rose again with a spring. His head shot up above the surface, above the swirl of foam, leafage, and débris; and sputteringly he gulped his lungs full of air. But before he could clear his eyes or his nostrils, or recover his self-possession, he was stealthily dragged down again. With a pang of horror he realised that he was caught by the foot.

A powerful swimmer, Barnes struck out mightily with his arms, and came to the surface again at once, rising beyond the shoulders. But by so much the more was he violently snatched back again, strangling and desperate, before he had time to empty his lungs and catch breath. This time the shock sobered him, flashing the full peril of the situation before his startled consciousness. With a tremendous effort of will he stopped his struggling, and contented himself with a gentle paddling to keep upright. This time he came more softly to the surface, clear beyond the chin. The foam, and débris, and turbulence of little waves seethed about his lips, and the sunlight danced confusingly in his streaming eyes; but he gulped a fresh lungful before he again went down.

Paddling warily now, he emerged again at once, and, with arms outspread, brought himself to a precarious equilibrium, his mouth just clear of the surface so long as he held his head well back. Keeping very still, he let his bewildered wits recover themselves and the agitated surface settle to quiet.

He was in a deep, tranquil cove, hardly stirred by an eddy. Some ten paces farther out from shore the main current swirled past sullenly, as if weary from the tumult of falls and rapids. Across the current a little space of sand-beach, jutting out from the leafy shore, shone golden in the sun. Up and down the stream, as far as his extremely restricted vision would suffer him to see, nothing but thick, overhanging branches, and the sullen current. Very cautiously he turned his head—though to do so brought the water over his lips—and saw behind him just what he expected. The high, almost perpendicular bank was scarred by a gash of bright, raw, reddish earth, where the brink had slipped away beneath his weight.

Just within reach of his hand lay, half-submerged, the thick, leafy top of a fallen poplar sapling, its roots apparently still clinging to the bank. Gently he laid hold of it, testing it, in the hope that it might prove solid enough to enable him to haul himself out. But it came away instantly in his grasp. And once more, in this slight disturbance of his equilibrium, his head went under.

Barnes was disappointed, but he was now absolutely master of his self-possession. In a moment he had regained the only position in which he could breathe comfortably. Then, because the sun was beating down too fiercely on the top of his head, he carefully drew the bushy top of the poplar sapling into such a position that it gave him shade. As its roots were still aground, it showed no tendency to float off and forsake him in his plight.

A very little consideration, accompanied by a cautious investigation with his free foot, speedily convinced him, a practical woodsman, that the trap in which he found himself caught could be nothing else than a couple of interlaced, twisted branches or roots of a tree which had fallen into the pool in some former caving-in of the bank. In that dark deep wherein his foot was held fast, his mind's eye could see it all well enough—the water-soaked, brown-green, slimy, inexorable coil, which had yielded to admit the unlucky member, then closed upon it like the jaws of an otter-trap. He could feel that grip—not severe, but uncompromisingly firm—clutching the joint. As he considered he began to draw comfort, however, from the fact that his invisible captor had displayed a certain amount of give-and-take. This elasticity meant either that it was a couple of branches slight enough to be flexible that held him, or that the

submerged tree itself was a small one, not too steadfastly anchored down. He would free himself easily enough, he thought, as soon as he should set about it coolly and systematically.

Taking a long breath, he sank his head under the surface, and peered downward through the amber-brown but transparent gloom. Little gleams of brighter light came twisting and quivering in from the swirls of the outer current. Barnes could not discern the bottom of the pool, which was evidently very deep; but he could see quite clearly the portion of the sunken tree in whose interwoven branches he was held. A shimmering golden ray fell just on the spot where his foot vanished to the ankle between two stout curves of what looked like slimy brown cable or sections of a tense snake-body.

It was, beyond question, a nasty-looking trap; and Barnes could not blink the fact that he was in a tight place. He lifted his face above the surface, steadied himself carefully, and breathed deeply and quietly for a couple of minutes, gathering strength for a swift and vigorous effort. Then, filling his lungs very moderately, the better to endure a strain, he stooped suddenly downward, deep into the amber gloom, and began wrenching with all his force at those oozy curves, striving to drag them apart. They gave a little, but not enough to release the imprisoned foot. Another moment, and he had to lift his head again for breath.

After some minutes of rest he repeated the choking struggle, but, as before, in vain. He could move the jaws of the trap just enough to encourage him a little, but not enough to gain his release. Again and again he tried it, again and again to fail just as he imagined himself on the verge of success; till at last he was forced, for the moment, to acknowledge defeat, finding himself so exhausted that he could hardly keep his mouth above water. Drawing down a stiffish upright branch of the sapling, he gripped it between his teeth, and so held himself upright while he rested his arms. This was a relief to nerves as well as muscles, because it made his balance, on which he depended for the chance to breathe, so much the less precarious.

As he hung there pondering, held but a bare half-inch above drowning, the desperateness of the situation presented itself to him in appalling clearness. How sunny, and warm, and safe to his woods-familiar eyes looked the green forest world about him! No sound broke the mild tranquillity of the solitude, except now and then an elfish gurgle of the slow current, or the sweetly cheerful *tsic-a-dee-dee* of an unseen chicadee, or (from the intense blue overhead) the abrupt, thin whistle of a soaring fish-hawk. To Barnes it all seemed such a safe, friendly world, his well-understood intimate since small boyhood! Yet here it was, apparently, turned smooth traitor at last, and about to destroy him as pitilessly as might the most scorching desert or blizzard-scourged ice-field. A silent rage burned suddenly through all his veins—which was well, since the cold of that spring-fed river had already begun to finger stealthily about his heart. A delicate little pale-blue butterfly, like a periwinkle-petal come to life, fluttered over Barnes's grim, upturned face, and went dancing gaily out across the shining water, joyous in the sun. In its dancing it chanced to dip a hairbreadth too low. The treacherous bright surface caught it, held it; and away it swept, struggling in helpless consternation against this unexpected doom. Before it passed out of Barnes's vision a trout rose and gulped it down. Its swift fate, to Barnes's haggard eyes, seemed an analogue in little to his own.

But it was not in the woodman's fibre to acknowledge himself actually beaten, either by man or fate, so long as there remained a spark in his brain to keep his will alive. He presently began searching with his eyes among the branches of the poplar sapling for one stout enough to serve him for a lever. With the right kind of stick in his hand, he told himself, he might manage to prise apart the jaws of the trap and get his foot free. At last his choice settled upon a branch that he thought would serve his turn. He was just about to reach up and break it off, when a slight crackling in the underbrush across the stream caught his ear.

His woodman's instinct kept him motionless as he turned his eyes to the spot. In the thick leafage there was a swaying, which moved down along the bank, but he could not see what was causing it. Softly he drew down a leafy branch of the sapling till it made him a perfect screen; then he peered up the channel to make out what the unseen wayfarer was following.

A huge salmon, battered and gashed from a vain struggle to leap the falls, was floating belly-upward down the current, close to Barnes's side of the stream. A gentle eddy caught it and drew it into the pool. Softly it came drifting towards Barnes's hidden face. In the twigs of the poplar sapling it came to a halt, its great scarlet gills barely moving as the last of life flickered out of it.

Barnes now understood quite well that unseen commotion which had followed along shore the course of the dying salmon. It was no surprise to him whatever when he saw a huge black bear emerge upon the yellow sandspit and stand staring across the current. Apparently, he was staring straight at Barnes's face, upturned upon the surface of the water. But Barnes knew he was staring at the dead salmon. His heart jumped sickeningly with sudden hope as an extravagant notion flashed into his brain. Here was his rescuer—a perilous one, to be sure—vouchsafed to him by some whim of the inscrutable forest fates. He drew down another branchy twig before his face, fearful lest his concealment should not be adequate. But in his excitement he disturbed his balance, and with the effort of his recovery the water swirled noticeably all about him. His heart sank. Assuredly, the bear would take alarm at this, and be afraid to come for the fish.

But, to his surprise, the great beast, which had

seemed to hesitate, at once plunged impetuously into the stream. Nothing, according to a bear's knowledge of life, could have made that sudden disturbance in the pool except some fish-loving otter or mink, intent upon seizing the booty. Indignant at the prospect of being forestalled by any such furtive marauder, the bear hurled himself forward with such force that the spray flew high into the branches, and the noise of his splashing was a clear notification that trespassers and meddlers had better keep off. That salmon was his by right of discovery, and he was going to have it.

The bear, for all the seeming clumsiness of his bulk, was a redoubtable swimmer; and almost before Barnes had decided clearly on his proper course of action those heavy, grunting snorts and vast expulsions of breath were at his ear. Enormously loud they sounded, shot thus close along the surface of the water. Perforce, Barnes made up his mind on the instant.

The bunch of twigs which had arrested the approach of the floating salmon lay just about an arm's-length from Barnes's face. Swimming high, his mighty shoulders thrusting up a wave before him which buried Barnes's head safely from view, the bear reached the salmon. Grabbing it triumphantly in his jaws, he turned to make for shore again.

This was Barnes's moment. Both arms shot out before him. Through the suffocating confusion his clutching fingers encountered the bear's haunches. Sinking into the long fur, they closed upon it with a grip of steel. Then, instinctively, Barnes shut his eyes and clenched his teeth, and waited for the shock, while his lungs felt as if in another minute they would burst.

But it was no long time he had to wait—perhaps two seconds—while amazement in the bear's brain translated itself through panic into action. Utterly horrified by this inexplicable attack from the rear and from the depths, the animal threw himself shoulder high from the water, and hurled himself forward with all his strength. Barnes felt those tremendous haunches heaving irresistibly beneath his clutching fingers. He felt himself drawn out straight and dragged ahead till he thought his ankle would snap. Almost he came to letting go, to save the ankle. But he held on, as much with his will as with his grip. Then the slimy thing in the depths gave way. He felt himself being jerked out through the water—free. His fingers relaxed their clutch on the bear's fur, and he came to the surface, gasping, blinking, and coughing.

For a moment or two he paddled softly, recovering his breath and shaking the water from nostrils and eyes. He had an instant of apprehensiveness lest the bear should turn upon him and attack him at a disadvantage, and by way of precaution he gave forth the most savage and piercing yell that his labouring lungs were capable of. But he saw at once that on this score he had nothing to fear. It was a well-frightened bear there, swimming frantically for the sandspit; while the dead salmon, quite forgotten, was drifting slowly away on the sullen current.

Barnes's foot was aching fiercely, but his heart was light. Swimming at leisure, so as to just keep head against the stream, he watched the bear scuttle out upon the sand. Once safe on dry land, the great beast turned and glanced back with a timid air to see what manner of being it was that had so astoundingly assailed him. Man he had seen before, but never man swimming like an otter; and the sight was nothing to reassure him. One longing look he cast upon the salmon, now floating some distance away; but that, to his startled mind, was just a lure of this same terrifying and perfidious creature whose bright gray eyes were staring at him so steadily from the surface of the water. He turned quickly and made off into the woods, followed by a loud, daunting laugh which spurred his pace to a panicky gallop.

When he was gone Barnes swam to the sandspit. There he stripped, wrung out his dripping clothes, and lay down in the hot sand to let the sun soak deep into his chilled veins.

AN IVORY MINIATURE.

Time on the fair white satin where it lies
Has left faint spots,
And touched with tarnishing the gilt which ties
True-lovers' knots.

But on the portrait it has only laid
A mellow grace,
Softening the tribute which the artist paid
To form and face.

A blue-eyed girl. About her shoulders lies
A scarf of lawn;
Back from her brow—the fashion, we surmise!—
Her hair is drawn.

She smiles serenely, and it is the smile
Which still we know
Who love her—aged, but as fair the while
As long ago.

Now—as she takes the portrait from its nest,
That we may see
How well he wrought who limned her at her best
For days to be—

We can but steal a glance as there she stands,
Beloved and fair;
And choose the picture made by Time's own hands,
That artist rare.

But she, unconscious, sees with other sight
Gates backward swung,
And minds the days when fair for her delight
The world was young.

SOME CELEBRITIES I HAVE KNOWN.

By A. STODART WALKER.

PART II.

JOHN STUART BLACKIE, ROBERT LOUIS STEVENSON, ROBERT BUCHANAN.

I HAVE already, in other places, recalled my impressions of John Stuart Blackie, which fact may serve as an apology for any lengthened reminiscence of a man connected to me by close relationship of blood and with whom I lived for several years. He was the most lovable man I have ever known. The rich, unfailing generosity of his nature was a revelation. He could thunder out opinions in public of a fairly eclectic and disturbing nature; but these outbursts were but fireworks, dramatic expressions of a nature completely soaked in charity. I do not think he was capable of a mean or an uncharitable thought; and such a thing as a subterfuge—nay, even a piece of diplomatic fencing—was as impossible to his character as was a lie. He was often impatient and hasty in his denunciations of intellectual points of view which seemed distasteful to him, but only in so far as they seemed to him to be shadowed by a spirit of irreverence and metaphysical hair-splitting. The man abroad and the man at home were two different men, inasmuch as the domestic animal was reserved, gentle, and unassertive, not 'hadden doun' by his environment by any means, but a timid mouse in comparison with the roaring lion of the public platform. He was more of a humorist than a wit, seldom a satirist. His humour found expression in the richness and wealth of his metaphor, and was inspired by his remarkable joy of living. His glory in life never failed. No man was more temperate than he, and no man despised more hotly the creature who put himself on a level with the swine; but I remember an incident which occurred to me when, as a small boy, I walked with him on Princes Street, Edinburgh, which demonstrated the breadth of his outlook, though it by no means implied a careless latitudinarian. A drunken man accosted us, and, I suppose in a rather self-righteous way, I gave vent to some easily culled platitudes on the evils of drink and on the horror of the drunkard's life. Blackie turned to me, and, striking the pavement with his stick, said, 'Remember, young man, it is better to live and be drunken than not to live at all.' Nothing roused him more than pessimistic disquisitions on life 'Is life worth living?' supplied him with a splendid text for his philosophical humour. I recall a few of his rejoinders when the subject was raised at the dinner-table at Douglas Crescent, Edinburgh:

> Is life worth living? To propose the question
> Gives proof of huge conceit or bad digestion.

And again:

> Is life worth living? Well, I would not fetter
> A free man's choice; try if death suits you better.

And one night, on retiring to bed, I found the following pinned on to my dressing-table:

> Is life worth living? Ask the blackcocks and the hens
> That pick hard berries in wild Highland glens;
> They die sometimes by rot, sometimes by shot,
> But all agree that they would rather not.
> Learn, reasoning youth, from the unreasoning bird,
> And when you could be wise, don't be absurd!

I recall a time when there was staying with us a perfervid Nonconformist who used to regale us with severe denunciations of those who did not see eye to eye with him in his theological opinions. One night at dinner our visitor was unusually sweeping in his condemnations. I saw that Blackie had suddenly fallen into a fit of abstraction, but in a few moments he jumped to his feet and hurled the following lines at the theological dogmatist:

> What, you! a midge, a moth, a mite,
> An atom in God's vast dominions!
> Think you that He would take delight
> To keep His heaven all right and tight
> A pocket-borough for your opinions?—

sweetening the attack in his usual way by throwing his arms around the person attacked.

[*All Rights Reserved.*]

I often wish I had kept some notes of the multitudinous flashes of ready truth and epigram that fell from his lips. He was never ordinary in his merest commonplaces, and yet never a *poseur* in the sense of striving to be original. Probably no man would have been more surprised at being told that he was eccentric, for I remember he once defined eccentricity as 'originality without sense.' Some of his impromptus I do recall: 'I give my right hand to Protestantism, my left to Romanism, and my heart to both; but my head I keep to myself.' 'Few men are good enough for Heaven, few bad enough for Hell.' 'Happiness is comparative: a barn-door hen is not unhappy in respect of locomotive capacity so long as it is not conscious of the difference between itself and an eagle.' 'A gentleman is a man who, when a subscription-list is sent round, always gives a guinea and never a pound.' He had no patience with the 5 per cent. reduction. 'Wine is the drink of the gods, milk the drink of babies, tea the drink of women, beer the drink of Germans, and water the drink of beasts. Wine is the poetry of water, champagne the poetry of wine.' 'An absolute Tory is generally a clod or a fool, a Tory with sense is a Liberal more or less, a Liberal with sense is a Tory more or less, and a Liberal without sense is a Radical.' 'There are only three infallibles: the Roman Pope, the editor of a party newspaper, and a woman when she is in the wrong.' When I went abroad to live in Paris, his parting words to me were: 'Hate no man, but pity sinners, despise cowards, avoid knaves, work with the wise, and amuse yourself with fools.' With these words he handed me a cheque, adding, 'That 's just twice as much as I got when I was a boy, but you have more wings than I had.' But I must not become garrulous on a subject which might carry me on unceasingly. I must take another farewell of a man who was a perfect triumph of personality. Some may echo Carlyle's earlier dictum, that 'Blackie was a man of more sail than ballast;' but more who knew the man intimately will hasten to accept Carlyle's later expression of his esteem: 'Blackie is a man of lively and brilliant intellectual faculties, of ardent friendly character, and of wide speculation and acquirement, very fearless, very kindly, without ill-humour, and without guile.' As another writer said after his death, 'Poet and publicist, scholar and teacher, patriot and philosopher, he was

> **A man so varied that he seemed to be**
> **Not one, but all mankind's epitome.**

Scotland will doubtless never lack her share of notable men. We cannot imagine a time when she will not have her Stevensons, her Aytouns, her Wilsons, her Jeffreys, and even her Chalmers, should the occasion arise; but imagination collapses when it tries to picture another Blackie.'

Robert Louis Stevenson I knew but slightly; in fact, I think I only spoke to him twice. I suppose I was too young to appreciate the subtle charms of the man upon which his friends love to dwell; therefore my boyish impression of him as a *poseur*, and as being given over to rather an irritating affectation, is not of any value. He very kindly sent me an invitation to stay with him in the south of England. It has always been one of my sorest regrets that I was not able to take advantage of that opportunity of learning more of a man who inspired so much affection in his friends. But I recall distinctly my early discovery of the strange and fascinating beauty of *Travels with a Donkey*. Stevenson was then not even a name to me, and the vivid impression that fascinating volume made upon an impressionable nature is still strong with me. I knew his mother better than I knew the writer himself, and all my memories of her are touched with a pleasurable feeling. To me there are few things more beautiful in life than the reticent pride shown by a mother in the legitimate triumphs of her son.

At home I met many Scotsmen of letters—James Grant, William Black, Alexander Nicholson, Dr Walter Smith, Mr Barrie, Sir Noel Paton, Mr Sellar, Sir Douglas Maclagan, Dr John Brown, Robertson Smith, and others; but of all the personalities that appealed to me by its essential 'bigness,' that of Robert Buchanan easily came first. If there ever lived a man who on the surface was the possessor of a definite dual personality, that was the author of *The City of Dream* and *Undertones*. To the general member of the great republic of letters Robert Buchanan was often a thorn in the flesh. He seemed to possess the remarkable capacity of quarrelling with nearly every fellow of his craft; with this rider: he always maintained an easy friendship with such men as Lecky, Herbert Spencer, Browning, and Tennyson, and it must not be deduced from this that I infer that all the men with whom he crossed swords were of the smaller fry. His antagonists included Swinburne, Matthew Arnold, and a few of the men of letters who hold at this moment a large place in public estimation. From his own deliberate choice he became, as he called himself, 'The Ishmael of Song,' and an Ishmael with the instincts of a fighter. The very curious anomaly in Buchanan's character was that though he had the best of the combat, he complained that he was unfairly treated in having to fight at all, even though he was the first to put on the gloves. At the beginning of a campaign he, indeed, shook his plumes with fiery glee. Often have I received a letter from him commencing something after this fashion: 'I am preparing a grand broadside for So-and-so.' 'Did you see that X. dares to patronise me in the ——? Look out in Saturday's ——. You will see that I don't take this kind of thing lying down.' And yet, in the spirit of the coster song, 'He would black your eye one moment and stand a pint the next.' The spirit of pity never deserted him, and he did not conceive it possible for him to bear a lifelong enmity. One thing is absolutely certain, and is worth remember-

ing by those who complain of Buchanan's belligerent methods. With the single exception of his anonymous attack on Rossetti—which he withdrew and apologised for in the most graceful and poetical way—he never attacked a man in the press without putting his name on the literary weapon.

For many years I was one of Buchanan's most intimate friends. We were as opposite temperamentally as the poles are geographically, but during all the years I enjoyed his comradeship we never once came even to the borderland of a quarrel. In private life he was remarkably patient and sympathetic, and was possessed of that first of all virtues, a sense of humour, without which companionship is impossible. He was of a surety a triumph of personality. He seemed an anachronism in the nineteenth century. His blood was too hot, he was too impatient, too downright, too pagan, too Bohemian, too thoroughly irrespectable, for the graceful ways of modern civilisation. He was Richard Steele, Robert Burns, Heine, Charles Dickens, and Walt Whitman rolled into one, with this qualification—if it be necessary—he never was an amorist at large and he never was intemperate. His brain, indeed, was eclectic and nineteenth century, but his heart was of the seventeenth and the eighteenth. He had a marked dislike for bigwigs and crowned authorities, whether in politics, religion, or literature, and an equal disdain of the charlatan and the Pecksniff. He loved Scotland, but he was intolerant to Edinburgh; and when I was first introduced to him, and was indicated as a member of the teaching staff of the Medical Faculty of the University, he immediately labelled me 'the village apothecary.'

He was full of the joy of living, and heaped bushels of scorn on the dreary crowd of literary undertakers whom he labelled 'the dismal throng.' But even at times his own optimism—in the face of failure, neglect, and ill-health—would occasionally waver. 'It's all very well,' he wrote to me once, 'for me to croak anathema on the Dismal Folk, but I'm a dismal, self-tormenting creature myself; and as for the joy of life, my share in it is a flickering candle. Friday next is my birthday. I shall keep it in the coal-cellar, with a sheet around me and ashes on my head. Why the deuce was I ever born?' 'I have had the usual experience of original men,' he wrote at another time. 'My worst work has been received with more or less toleration, and my best work misunderstood or neglected; while the self-authorised critical pilots who haunt the shallows of journalism have agreed that I am a factious and opinionated mariner, doomed, like my own Dutchman in *The Outcast*, to eternal damnation because, like my prototype, I have once or twice been provoked to violent language. For nearly a generation I have suffered a constant literary persecution. Even the good Samaritans have passed me by. Yet I survive, as you know, and may even call myself contented, hating no man, fearing no man, envying no man. Few men, however, have had to struggle harder even for the merest food and air.'

Of his kindness to me I cannot write in cold ink. It was the embodiment of unselfish generosity, and when I recall the hundreds of little acts of charity performed for others I sometimes wonder why he had so few friends. To me he seemed the most exhilarating and absorbing of men, despite our divergence at myriads of points, in conduct, thought, and belief. Perhaps the reason lies in the fact that most people love the easy-souled paths of diplomatic agreement, which at any rate did not appeal to me when I was younger. He was never squint-brained or knock-kneed in his thoughts. If he were wrong his fallacies were superb. Right or wrong, he was 'a whole-hogger.' His inconsistencies were not puny—they were magnificent; he had not the faults of a pigmy but those of a giant. His pawns were not little fishes but big men and big things. He did not fight with a rapier but with a two-edged sword. His aspirations were not towards Chinese lanterns but towards the stars. He hated a snigger; he preferred the hearty laugh or the uncompromising frown. He had no time for an anæmic Mephistopheles, but was quite willing to try conclusions with a full-blooded Satan. This was the man as I found him, given to sad hack-work at times, but capable of superb efforts in literature; and as for his position on the slopes of Parnassus, his time has not yet come.

When the sediment of his work has all been riddled out, it will be found that in his *City of Dream*, his *Undertones*, his *Ballad of Mary the Mother*, his *New Rome*, he has bequeathed a precious legacy to those whose literary and moral ideals are a little more ambitious than the gutter and the village pump. I have used the word 'sediment' advisedly, for Buchanan drew a big distinction between his serious literary efforts and his merely hack-work. And nothing irritated him more than the fact that the world was more familiar with the latter than with the former. His melodramas and his stories had a vogue, and were familiar to many who had never heard of *The Wandering Jew* or *The City of Dream*. 'It makes me savage,' he wrote to me, 'when people rave over my inferior efforts and ignore the aftermath of a long life's thought and aspiration. I find that many people are quite ignorant of my best writings even when considerably interested in me as an author. I never dream of inflicting you with my pot-boilers. I shall send you any work of mine which possesses my own affection, as this [*The Devil's Case*] does. This is a book, by the way, which will be torn in pieces and boycotted, which will be thought by many to be the very acme of human blasphemy; but it is true for all that, and will live. I had just finished it when my beloved mother died, and for a time I hesitated about publishing it, and I do so now because I am convinced that she would have approved it, for even in her last illness she clearly and penetratingly

held her old eclectic faith. This is the dedication to her, which I transcribe for the first time, and send to you, my dear Walker:

DEDICATION

(*Nov. 5th*, 1894).

While the life-blood was spun
From the heart in her breast,
She look'd on her son,
Smiled, and rock'd him to rest. . . .

How swift the hours run
From the east to the west!
Erect stood the son,
And the mother was blest!

Of all the joys won,
Love like his seem'd the best;
He was ever the son
Whom she rock'd on the breast.

Yet lo! all is done!
('Twas, my God, Thy behest!)
In his turn, the gray son
Rocks the mother to rest.

All is o'er, ere begun!
Oh my dearest and best,
Sleep in peace, till thy son
Creepeth back to thy breast!'

It may be noted that this differs markedly from the poem as afterwards printed in *The Devil's Case*.

Shortly after the appearance of *The Devil's Case* I prepared a study of the historical and literary Devil, and a letter which Buchanan wrote me on the subject is noteworthy: 'What you say about the Devil is very interesting. *My* Devil is different from all the rest (Milton's, Marlowe's, Luther's, Goethe's, Calderon's, and Byron's), so far as he is really God-evolving, as the spirit of knowledge and sympathy, as opposed to the creeds which say knowledge is evil. Goethe's Mephisto is as crude a conception as even the Scotch *Deil*—mere intellect without heart, whereas I hold that intellect implies heart, and true knowledge holiness. Goethe's typical woman—e.g. Marguerite—is a fool; it is because she is ignorant, not because she is good, that she falls; whereas Goethe poses her as the type of purity and finally as the Eternal Feminine. But it is pure ignorance that makes her spell-bound by the jewels, and leads her to poison her mother and kill her child. *My* Devil would have saved her, Goethe's monkey-devil destroys her easily. Goethe, in fact, took the vulgar view. Hence the vogue of his poem.'

Buchanan's reference to the Scotch Deil I find in another of his letters in my possession: 'I propose to introduce you, as expressed in your stimulating and suggestive volume, *The Struggle for Success*, as one of the characters in a forthcoming work of mine on Burns, which I hope to get out before the Centenary. I shall also present that brave old Scot—a man in an age of pigmies—Professor Blackie, and perhaps also that other warm-hearted and big-brained Highlander, Norman Macleod. Blackie and Macleod seem to me to stand quite alone in the history of modern Scotland. My book will make some Scotsmen squirm! 'Tis an odd work, and will greatly tickle you. The following will be the title, or something like it: "*The Land of 'the Deil'*: a Story for the Burns Centenary, including the Paradox of Scottish Civilisation, with a Preface by the Devil." What do you think of that, my limmer?' As far as I am able to gather, that suggestive volume was only planned and never carried far in its execution.

Buchanan was a man who was constantly in difficulties in regard to money matters, and at one time his coffers were full, at another desperately empty. He would send me an urgent wire asking me to join him on his yacht or to shoot over his moor, and a year after he would be hard at work to make himself the possessor of a living wage. He was extraordinarily improvident, and gave money away right and left to those who appealed to his sympathy—broken-down actors, starving men of letters, helots of the turf, unfortunate women. I found it extremely difficult to get him to accept any money due to him for transactions undertaken for me. If I asked him, 'How much do I owe you, Bard?' he invariably answered in the same strain, 'Eight thousand five hundred and nineteen pounds four shillings and sevenpence,' or 'Give me half a million, and we will cry quits.' If we dined together casually, one, two, six of us, he invariably managed to get hold of the bill and pay it. This trick of his, of course, became familiar, and we seldom asked him to dinner unless we had arranged the matter beforehand with the powers that be. When he discovered that fact he would say, 'Oh, this is a duke's affair! All right, I expect to be treated as in a ducal mansion.' It was the same with cabs and trains. He was a large, stout man, but he had a curious faculty of reaching the cabman's hand or the ticket-office before the slimmest of us.

He was a confirmed turf-speculator—a strange pursuit for a singer of songs and dreamer of dreams; and it need hardly be said he lost far more than he gained; but when he was successful—and occasionally his winnings were large—he always managed to find a means of sharing his good fortune with those less privileged than himself. One of his many methods of telling white lies was this: 'How are you, X.? I owe you twenty pounds.' 'This is the first I have heard of it,' would likely be the reply. 'Oh, I took the liberty of putting a sovereign on King Charles for you, and he started at 20 to 1;' and forthwith he handed over the money. 'I say, Spider,' he once called to one of those many vagabond mercenaries who frequent the turf, 'there's a fiver for you. I put it on Seaton Deleval in your name, and she came in at 5 to 1.' The lie was evident enough to us, but as it was intended to relieve the recipient of a feeling of obligation, it was generously conceived—and even in the books of the recording angel probably forgiven.

THE HOUSE OF WHISPERS.

CHAPTER VIII.—CASTING THE BAIT.

LOVING and perishing: these have tallied from eternity. Love and death walk hand-in-hand. The will to love means also to be ready for death.

Gabrielle Heyburn recognised this truth. She had the will to love, and she had the resolve to perish—perish by her own hand—rather than allow her secret to be exposed. Those who knew her—a young, athletic, merry-faced, open-air girl on the verge of budding womanhood, so true-hearted, frank, and free—little dreamed of the terrible nature of that secret within her young heart.

She held aloof from her lover as much as she dared. True, Walter came to Glencardine nearly every day, but she managed to avoid him whenever possible. Why? Because she knew her own weakness; she feared being compelled by his stronger nature, and by the true affection in which she held him, to confess. They walked together in the cool, shady glen beside the rippling burn, climbed the neighbouring hills, played tennis, or else she lay in the hammock at the edge of the lawn while he lounged at her side smoking cigarettes. She did all this because she was compelled.

Her most enjoyable hours were the quiet ones spent at her father's side. Alone in the library, she read to him, in French, those curious business documents which came so often by registered post. They were so strangely worded that, not knowing their true import, she failed to understand them. All were neatly typed, without any heading to the paper. Sometimes a printed address in the Boulevard des Capucines, Paris, would appear on letters accompanying the enclosures. But all were very formal, and to Gabrielle extremely puzzling.

Sir Henry always took the greatest precaution that no one should obtain sight of these confidential reports or overhear them read by his daughter. Before she sat down to read, she always shot the small brass bolt on the door to prevent Hill or any other intruder from entering. More than once the Baronet's wife had wanted to come in while the reading was in progress, whereupon Sir Henry always excused himself, saying that he locked his door against his guests when he wished to be alone, an explanation which her ladyship accepted.

These strangely worded reports in French always puzzled the Baronet's daughter. Sometimes she became seized by a vague suspicion that her father was carrying on some business which was not altogether honourable. Why should he enjoin such secrecy? Why should he cause her to write and despatch with her own hand such curiously worded telegrams, addressed always to the registered address: 'METEFOROS, PARIS'?

Those neatly typed pages which she read could be always construed in two or three senses. But only her father knew the actual meaning which the writer intended to convey. For hours she would often be engaged in reading them. Sometimes, too, telegrams in cipher arrived, and she would then obtain the little, dark-blue covered book from the safe, and by its aid decipher the messages from the French capital.

Questions, curious questions, were frequently asked by the anonymous sender of the reports; and to these her father replied by means of his private code. She had become during the past year quite an expert typist, and therefore to her the Baronet entrusted the replies, always impressing upon her the need of absolute secrecy, even from her mother.

'My affairs,' he often declared, 'concern nobody but myself. I trust in you, Gabrielle dear, to guard my secrets from prying eyes. I know that you yourself must often be puzzled, but that is only natural.'

Unfamiliar as the girl was with business in any form, she had during the past year arrived at the conclusion, after much debate within herself, that this source of her father's income was a distinctly mysterious one. The estates were, of course, large, and he employed agents to manage them; but they could not produce that huge income which she knew he possessed, for had she not more than once seen the amount of his balance at his banker's as well as the large sum he had on deposit? The source of his colossal wealth was a mystery, but was no doubt connected with his curious and constant communications with Paris.

At rare intervals a gray-faced, gray-bearded, and rather stout Frenchman—a certain Monsieur Goslin—called, and on such occasions was closeted for a long time alone with Sir Henry, evidently discussing some important affair in secret. To her ladyship, as well as to Gabrielle, the Frenchman was most courteous, but refused the pressing invitations to remain the night. He always arrived by the morning train from Perth, and left for the south the same night, the express being stopped for him by signal at Auchterarder station. The mysterious visitor puzzled Gabrielle considerably. Her father entrusted him with secrets which he withheld from her, and this often caused her both surprise and annoyance. Like every other girl, she was of course full of curiosity.

Towards her Flockart became daily more friendly. On two occasions, after breakfast, he had invited her to spend an hour or two fishing for trout in the burn, which was unexpectedly in spate,

and they had thus been some time in each other's company.

She, however, regarded him with distinct distrust. He was undeniably good-looking, nonchalant, and a thorough-going man of the world. But his intimate friendship with Lady Heyburn prevented her from regarding him as a true friend. Towards her he was ever most courteous, and paid her many little compliments. He tied her flies, he fitted her rod, and if her line became entangled in the trees he always put matters right. Not, however, that she could not do it all herself. In her strong, high fishing-boots, her short skirts hemmed with leather, her burberry, and her dark-blue tam-o'-shanter set jauntily on her chestnut hair, she very often fished alone, and made quite respectable baskets. To wade into the burn and disentangle her line from beneath a stone was to her quite a small occurrence, for she would never let either Stewart or any of the under-keepers accompany her.

Why Flockart had so suddenly sought her society she failed to discern. Hitherto, though always extremely polite, he had treated her as a child, which she naturally resented. At length, however, he seemed to have realised that she now possessed the average intelligence of a young woman.

He had never repeated those strange words he had uttered when, on the night of the ball at Connachan, he returned in secret to the castle and beckoned her out upon the lawn. He had, indeed, never referred to his curious action. Sometimes she wondered, so changed was his manner, whether he had actually forgotten the incident altogether. He had showed himself in his true colours that night. Whatever suspicions she had previously held were corroborated in that stroll across the lawn in the dark shadow. His tactics had altered, it seemed, and their objective puzzled her.

'It must be very dull for you here, Miss Heyburn,' he remarked to her one bright morning as they were casting up-stream near one another. They were standing not far from a rustic bridge in a deep, leafy glen, where the sunshine penetrated here and there through the canopy of leaves, beneath which the burn pursued its sinuous course towards the Earn. The music of the rippling waters over the brown, moss-grown boulders mingled with the rustle of the leaves above, as now and then the soft wind swept up the narrow valley. They were treading a carpet of wild-flowers, and the air was full of the delicious perfume of the summer day. 'You must be very dull, living here so much, and going up to town so very seldom,' he said.

'Oh dear no!' she laughed. 'You are quite mistaken. I really enjoy a country life. It's so jolly after the confinement and rigorous rules of school. One is free up here. I can wear my old clothes, and go cycling, fishing, shooting, curling; in fact, I'm my own mistress. That I shouldn't be if I lived in London, and had to make calls, walk in the Park, go shopping, sit out concerts, and all that sort of thing.'

'But though you're out, you never go anywhere. Surely that's unusual for one so active and—well'—he hesitated—'I wonder whether I might be permitted to say so—so good-looking as you are, Gabrielle.'

'Ah!' replied the girl, protesting, but blushing at the same time, 'you're poking fun at me, Mr Flockart. All I can reply is, first, that I'm not good-looking; and, secondly, I'm not in the least dull—perhaps I should be if I hadn't my father's affairs to attend to.'

'They seem to take up a lot of your time,' he said with pretended indifference, but, to his annoyance, landing a salmon parr at the same moment.

'We work together most evenings,' was her reply.

The question which he then put as he threw the parr back into the burn struck her as curious. It was evident that he was endeavouring to learn from her the nature of her father's correspondence. But she was shrewd enough to parry all his ingenious cross-questioning. Her father's secrets were her own.

'Some ill-natured people gossip about Sir Henry,' he remarked presently, as he made another long cast up-stream and allowed the flies to be carried down to within a few yards from where he stood. 'They say that his source of income is mysterious, and that it is not altogether open and above-board.'

'What!' she exclaimed, looking at him quickly. 'And who, pray, Mr Flockart, makes this allegation against my father?'

'Oh, I really don't know who started the gossip. The source of such tales is always difficult to discover. Some enemy, no doubt. Every man in this world of ours has enemies.'

'What do you mean by the source of dad's income not being an honourable one?'

The man shrugged his shoulders. 'I really don't know,' he declared. 'I only repeat what I've heard once or twice up in London.'

'Tell me exactly what they say,' demanded the girl, with quick interest.

Her companion hesitated for a few seconds. 'Well, whatever has been said, I've always denied; for, as you know, I am a friend of both Lady Heyburn and of your father.'

The girl's nostrils dilated slightly. Friend! Why, was not this man her father's false friend? Was he not behind every sinister action of Lady Heyburn's, and had not she herself, with her own ears, one day at Park Street, four years ago, overheard her ladyship express a dastardly desire in the words, 'Oh, Henry is such a dreadful old bore, and so utterly useless, that it's a shame a woman like myself should be tied up to him. Fortunately for me, he already has one foot in the grave. Otherwise I couldn't tolerate this life at all'? Those cruel words of her stepmother's, spoken to this man who was at that moment her companion, recurred to her. She recollected, too, Flockart's reply.

This hollow pretence of friendship angered her. She knew that the man was her father's enemy,

and that he had united with the clever, scheming woman in some ingenious conspiracy against the poor, helpless man.

Therefore she turned, and, facing him boldly, said, 'I wish, Mr Flockart, that you would please understand that I have no intention to discuss my father or his affairs. The latter concern himself alone. He does not even speak of them to his wife; therefore why should strangers evince any interest in them?'

'Because there are rumours—rumours of a mystery; and mysteries are always interesting and attractive,' was his answer.

'True,' she said meaningly. 'Just as rumours concerning certain of my father's guests possess an unusual interest for him, Mr Flockart. Though my father may be blind, his hearing is still excellent. And he is aware of much more than you think.'

The man glanced at her for an instant, and his face darkened. The girl's ominous words filled him with vague apprehension. Was it possible that the blind man had any suspicion of what was intended? He held his breath, and made another vicious cast far up the rippling stream.

(To be continued.)

THE AMERICAN TOBACCO WAR.

By WILLIAM D. ALLEN.

IN America tobacco is called one of the money-making crops by the farmer for the reason that the best kinds will only grow in certain parts of the country where climate and soil are favourable. The skilful farmer, however, may grow such a fine quality of tobacco that from a little patch of five or six acres his harvest may be enough to give him a profit of one hundred pounds sterling or more in a year; for some of the 'weed,' as it is called in the United States, is in such demand for the pipe and cigarette of the Englishman and Frenchman that the farmer sells it at what would be three shillings a pound in English money.

This is why the growing of tobacco is as fascinating to many farmers in the southern states of America as is the search for gold or precious stones to the mine hunter. The principal region from which the best tobacco comes is located in the states of Kentucky and Tennessee, also in portions of Indiana and Ohio. In Kentucky is what is known as the Blue Grass district, so called because of the beautiful colour of the grass which springs from its fields and valleys—a hue nearer blue than green. From the Blue Grass district comes much of the tobacco which goes to Great Britain—a 'leaf' which is of a rich brown in tint and highly prized for the pipe. From the Blue Grass also comes most of what is called the Burley, another fine quality, which is made into chewing tobacco for the American and German. On the borders of this region is the country called the Black Patch, because here is grown a plant which has very dark leaves, thousands of tons being sent across the water to the Austrians and Germans, as they are fond of what the American calls strong tobacco.

This tobacco country, which is the most extensive in the United States, contains no less than one hundred and fifty thousand farmers, most of whom depend upon the plant for a livelihood. In a single year a harvest has been gathered from five hundred thousand acres which amounted to one hundred and seventy-five thousand tons, for which the rest of America and Europe have paid the tobacco farmers the sum of five million pounds sterling. The great wealth which comes from the soil has caused this part of the United States to be the scene of what might be called a miniature war, for the reason that bands of armed men have roamed over it, destroying warehouses and homes, burning tobacco barns, even killing and injuring those who would attempt to defend their property from destruction. In a score of towns in the Blue Grass district soldiers have been on guard to prevent them from being attacked by the marauders, while the tobacco-growers in the country who have incurred the enmity of the Night Riders have secured rifles and pistols to defend themselves and their families. The outlaws—for such they may be termed—have not hesitated to attack even cities, and are so numerous that bodies of two hundred or more have gone here and there terrorising the farmers.

The Night Riders who have caused this havoc in the very heart of the United States are not of the lower classes, but in many cases are tobacco-growers themselves. It is known that they are organised into two associations, one of which is called the Planters' Protective Association, and the other the American Society of Equity. The reason for the organisations is this: both wish to control the sale of all the tobacco from this region so that higher prices can be obtained. In other words, they have formed what is called in America a trust, but made up chiefly of farmers. They are endeavouring to force every one who raises tobacco to join them, and this is why the laws have been defied, so that in some parts of the tobacco country a state of anarchy literally exists.

The tobacco farmers who have not joined the Planters' Protective Association or the American Society of Equity sell most of their crop to what is known in the United States as the Tobacco Trust—the American Tobacco Company. Through this company the bulk of the tobacco which goes into the pipe, cigar, and cigarette of Europe is sent

across the Atlantic. It buys so much of the plant in a year that until the farmers' trusts were organised it 'controlled the market;' that is, it regulated the prices for most of the tobacco, and often the farmers were obliged to sell their crops for such a small amount of money that the returns were less than what it cost to produce the harvest. Since the farmers' trusts came into existence and began to fight the American Tobacco Company, it has been forced to increase the valuation of the tobacco it buys, and this has tempted many of the growers of the Burley and Black Patch tobaccos to sell to it rather than to the farmers' associations. The Tobacco War, as it is now called, is being waged against those farmers who are outside of the associations. They are called both Independents and Hill Billies, the latter term being a name by which the lower class of whites in Kentucky and adjacent states have been called for many years—a term of contempt.

Such is the feeling against the Hill Billies that the Night Riders think nothing of committing murder if necessary to accomplish their ends, while, as already stated, they have destroyed buildings in addition to 'scraping' or uprooting fields of young tobacco-plants and committing other outrages. The assailants are called Night Riders for the reason that most of their depredations occur under cover of the night, so that those who are engaged in the work may not be known; but usually their faces are hidden by cloth masks. Night riding began as soon as the farmers' associations were organised. First the farmers outside the associations were threatened by unsigned letters. A few barns were burned, and tobacco not pledged by the associations was thus destroyed. Plant-beds were scraped. Bundles of matches and switches were sent to persons who talked against the associations, and later they were burned out or whipped. For more than a year this continued, and it frightened ten thousand men into the associations.

Then came the first night-riding adventure, which gave evidence of careful planning and organisation. This was the descent of a band of armed and masked men, marked by badges, on the city of Trenton, Kentucky, where they burned the tobacco warehouse and factory of an independent dealer who had bought non-association tobacco. A little later they appeared at Elkton, Kentucky, and dynamited the warehouse there. Nothing more was heard of them as an organisation, except for an occasional whipping or barn burning, until December 1, 1906, when two hundred armed and masked men rode into the city of Princeton at night, took entire possession of it, 'shot it up' until opposition subsided, and proceeded at leisure to burn the largest tobacco stemmeries in the world, filled with tobacco purchased for the British market. Again there was a spell of quiet, and then, after a long series of failures, an organised band invaded and burned the independent warehouses. A month later to a day they attacked Russellville and did the same. In a few days they made an attempt to attack the town of Clarksville, Tennessee, but were repulsed. Springfield set a guard with a rapid-fire cannon and remained secure; but Dycusburg, in the Green River district, awoke in the night to find its streets filled with armed marauders, several of its buildings in flames, and some of its citizens—and the wife of one of them—being beaten in the public street, as a warning against independence.

The boldest attack which has been made by the Night Riders was the capture of the city of Hopkinsville, a community of no less than twelve thousand people. Entering the city about midnight, a band of fully two hundred captured the police on duty, and placed guards over the houses containing the fire apparatus; then, dividing into squads, some started to burn the business part of the city, while others prevented the citizens from attempting to extinguish the fire. The Night Riders began their work of destruction by breaking into a store, from which they brought out barrels of petroleum. Warehouse after warehouse was forced open, the oil barrels emptied of their contents, and the match applied. Their way into one of the buildings was barred by massive iron doors and shutters. With a charge of dynamite a gap was torn in the brick wall, and soon tongues of flame were leaping high above it, while half a million dollars' worth of tobacco was being destroyed.

While this was going on a train of railroad cars loaded with tobacco had been set on fire. After the incendiaries had gone, a railway-man, in order to save the end car, to which the flames had not spread, uncoupled it from the others and with a crowbar tried to move it along the track. While he was thus engaged some of the raiders returned, and without a word shot him down, then fired this car as well, remaining until it was wrapped in flames. So rapidly and so systematically did the assailants perform their work that within an hour after they entered the city every warehouse of the independents was ablaze, and on the outskirts of the burning square stood masked men, rifles in hand, while, as stated, another squad kept the fire company within range of their weapons.

While the Night Riders held the people in the centre of the town indoors by menacing them with their rifles and shooting at their homes, they were not numerous enough to guard the streets in the outer sections. Of course the fire and the noise soon aroused every resident. Dressing themselves as hastily as possible, they hurried to the scene of the conflagration, only to find a line over which none could cross without being the target for rifle or pistol. At first they were too startled to think of resisting or defending their property, but finally the deputy-sheriff, a hard-muscled, sturdy Irish Kentuckian, managed to get together a posse of determined men.

So intent was the mob on its work of destruction that the arming of the citizens was unknown until they were ready to attack. Before the squads who were applying the match and torch had rejoined their comrades the body of citizens charged on those who

were guarding the burning square. Among the citizens were lawyers, doctors, even clergymen, but every man had his blood up and his weapon loaded to kill if need be. Firing as they ran, they dashed upon the line of masked men. Hearing the rattle of the fusillade and the shouts of their companions, the other marauders hurried to their aid. So hot was the fire of the citizens, however, that the invaders slowly retreated until they had reached their horses. Springing into their saddles, the Night Riders formed for another stand, but bullets from the citizens' rifles fell thick and fast among them. Dismayed by the continued and apparently increasing resistance, the band put spurs to their horses and swept out of the town.

Realising that further pursuit was futile, the citizens remained in the town, where for the remainder of the night armed men patrolled the boundaries. The sheriff telegraphed to the Governor for a detachment of state troops. Governor Wilson immediately ordered the Adjutant-General to conduct troops to Hopkinsville. Two companies of soldiers were soon on the scene. Tents were pitched in the streets, and the court-house was turned into military barracks.

Since the attack on Hopkinsville, in a single week the Night Riders visited as many as a dozen localities where the Hill Billies reside. A raiding party swept down on Fredonia, cut the telephone and telegraph wires surrounding it, 'shot up' its streets, and burned the warehouses and factories of those who seemed to be leaders in opposition to the organisations. Two nights later a band of seventy-five Night Riders, crossing the state line, attacked at midnight a farmer and his son who had just finished loading their tobacco on wagons to carry it to market. After a battle in which father and son were wounded and their ammunition exhausted, the marauders entered the barn, shot the horses, dynamited the wagons, and fired the building. Proceeding to the next farm, they whipped two negroes, one almost fatally, and burned a barn full of tobacco—in all ten tons of leaf that night. Another night they descended within two miles of Hopkinsville, dragged Lucian Means, a white farmer, from his house, and severely beat him with a rawhide whip.

Not always do the Night Riders use the rifle, pistol, and torch. Several instances have occurred in which they exploded dynamite with terrible effect. This was shown in the outrage committed on what is known as the Hollman Farm, near the town of Henderson in Kentucky. Frank Hollman was one of the largest independent tobacco-raisers in that section. He had received several warnings to stop growing tobacco, or to join the farmers' associations, on pain of death or destruction of his property. Hollman had the reputation of being a fearless man, and was known to carry arms with him. He paid no attention to the threats. One morning, a few weeks after receiving the last notice from the Night Riders, he started out to plough a field in which tobacco was to be planted. With him was his ten-year-old son. Shortly after Hollman began to work, the inmates of his home were startled to hear a loud explosion, and saw a cloud of smoke rising from the field. Hurrying to the place, they found the bodies of father and son shockingly mutilated, as well as the horses, evidently killed by some powerful explosive, as the plough itself was blown to splinters, and a large hole in the ground showed where the powder had also spent its force. As dynamite cartridges have been found buried in tobacco lands owned by the Hill Billies, it is supposed that the Night Riders buried some in the Hollman field, and that the plough coming in contact with one of the missiles wrought the deadly work.

So bitter is this warfare that the farmers' associations notified their members not to plant any tobacco whatever during the year 1908. The president of the American Society of Equity sent a notice throughout Kentucky threatening any one who seeds even an acre of soil with the destruction of his property and a whipping by the Night Riders, if not death itself. That this is no idle warning is shown by the many outrages already committed. While a number of the towns containing warehouses where the independents store their tobacco are now guarded by troops, it is impossible to protect the farmers in the outlying districts, so that the majority are in great fear of the associations. This means that many miles of fields were barren during 1908, and that Europeans as well as Americans had to pay a much higher price for the pleasure of the nicotine. But what is worse, the edict of these trusts means absolute ruin to thousands of tillers of the soil. The reason for this step is that the common foe of the farmers' trusts may be prevented from obtaining any supply of tobacco during the next year, and thus be forced to assent to the demands of the associations.

The way in which the Night Riders are endeavouring to compel the planters to join their associations is shown by the story of one of the largest tobacco-growers in the Blue Grass region. He is also one of the oldest planters, having raised crops steadily for over twenty years. At last, however, he has given up the fight, and this is the reason as given in his own words:

'When this trouble began I was growing thirty acres of tobacco. I have about five hundred acres of land. The manager of the association came to me and asked me to sign a pledge to sell my tobacco only to its agents. A lot of my neighbours said they would go the way I did. I have always been a good deal of a leader around here, I suppose, and have always had a great many friends. I said, "No, I won't go in that with you. You haven't any property; you haven't any security. The warehouse you ask me to ship to is run by two men who have been dismissed from the tobacco exchange for robbing their customers. They are dishonest. You have no standing at bank. I prefer to run my own business. But I will do this: I will reduce my

acreage and hold off till you sell your crop before marketing mine."

'Then they began persecution. They drove away my negroes, and I got more. They threatened to scrape my plant-beds. All one night my sons lay on guard in the woods. Towards morning the Night Riders came, and the boys fired on them with buckshot. The riders fled in a panic, yelling with pain; so we know we shot some, but not who they were. After that defence of our property we were ostracised—we and the eight or ten other Hill Billies around here. They threatened to burn my barns. They did scrape one plant-bed. They put matches and dynamite in my wheat. Eight of us had to go to northern Kentucky to get a threshing machine, escort it here under arms, and escort it back again, after guarding it night and day and fighting off those who would have dynamited us. They have cut us out of church, ordered the school-teacher to send away Hill Billy children, driven one school-teacher away because she wouldn't obey them, and at last made war on my wife by horse-whipping our negro hands and threatening to kill any negro woman who steps foot on our land; so that my wife, who is over sixty, has to do all the work at the tubs and in the kitchen. It has been more than three years now of continued warfare. If I wished to move, I could not sell my farm.'

THE LUCK O' THE SPEY.

CHAPTER IV.

ON a dark morning three days afterwards a white light shone suddenly from a vessel out on the firth. It was as quickly obscured, a red light was run up and down from the masthead twice, and the sea was dark again. Then three answering jets came from the sand-dunes. The signals were from the revenue cutter, and the answers came from a preventive officer and two men on patrol along the shore of Spey Bay, about two miles west of Garmouth.

'That 's the *Kestrel*, sir, dodgin' about till daylight, signallin' everythin' all right.'

'Well, well, not a minute too soon for us, for 'tis a cold night,' said the officer as he rose stiffly, after his night watch among the bent-held hillocks. 'You and I will get home, Dan'l, and see the early patrol before we turn in; and Eric Edwards, here, can reach Findburgh in time for breakfast. Report yourself as usual. Mornin'.'

'Mornin', sir,' said the Findburgh patrol.

The little party separated, the officer and the man Dan'l towards Garmouth, and Edwards westwards on his patrol. The two men walked along slowly, deliberately keeping off the beaten coast-path, picking their way quietly now over the shingle, now over the dunes or the soft sand. They spoke but little, for their calling made them cautious. They were armed, it is true, but they were only two in number; the night wind might have carried their voices to any belated free-traders, and the 'gentle traffic' had occasionally anything but gentle methods.

So they walked quietly and cautiously until the slow fingers of the February dawn touched the face of the waters. They were within a mile of the sleeping hamlet, close to their boathouse, the murmur of the Spey at the bar clear in the still morning. The officer clambered to the top of a sand-dune and took a look around, then suddenly crouched, and rolled noiselessly down to the waiting Dan'l.

'Down!' he whispered. 'A man!' and whipped out a pistol. The other did the same, and they both crawled cautiously to the edge of the dune.

On the beach, just at high-water mark, they could make out in the faint light the figure of a man lying face downward, his head on the sea-wrack. The officer rose, covering the man with his pistol, but lowered it almost instantly, for there was no stealth in the figure's pose, no purpose in the limp, outstretched arms. An oyster-catcher, in dainty black-and-white cutaway, with the uncanny knowledge given to birds and beasts, strutted unafraid close to the man's hand.

'No need for pistols, Dan'l,' said the officer, as he put his into his belt and took off his hat. 'He 's in his long sleep.'

They bent over the body. The officer gently turned it over. The light fell on the face and the fair hair and a little black-handled knife up to the hilt in his throat.

'God save us a'!' said Dan'l in a shaking whisper. 'It 's Douglas the "floater" cast up by the tide. Is 't murder?'

The officer said nothing, but bent closer over the skean-dhu. 'We 'll carry him to the boathouse first,' he said, and in a few moments this was done, the door locked, and the officer turned to Dan'l. 'You will keep guard here till I return, telling nothing of what we know to anybody. I 'll take the keys with me. I 'm riding to Castle Lossie,' he said.

'Ye 'll—ye 'll no' be lang, sir?' said Dan'l, with an eloquent glance at the locked boathouse. 'I think I can hear him singing yet.'

'Two hours or less;' and the coastguard hurried off. Dan'l heard the *clip, clip* of his horse's trot through the sleeping street, then the *hurry-up, hurry-up* of the hoofs as they broke into a gallop outside the town, and he knew that the officer would be as good as his word.

Two hours later the morning broke clear over a dancing sea of blue-and-white, and the waiting Dan'l heard again the clatter of hoofs, this time

of more than one horse, and a jingle of accoutrements. The sound ceased, and in a minute or two the officer, followed by two gentlemen, came quickly over the bents.

'This is the Sheriff of the county and the Fiscal,' said the officer.

'We'll hear him afterwards, Steuart,' said the Sheriff, a tall, dark gentleman, his face flushed with the sharp morning gallop. 'Meanwhile'—— He gave a nod towards the boathouse where It lay.

The two officials and the coastguards went into the little hut. When they came out, the Sheriff held a blood-stained skean-dhu in his hand, and looked at the handle for a moment in the light. Then he waved his hand to the little wood fringing the sand. There was a glimpse of scarlet through the trees, as four redcoats appeared, leading their horses, along with the Sheriff's and the Fiscal's. The Sheriff took a pistol from his holster, and they fell into single file along the path, bringing up at the still closed door of 'The Norway Lass.'

In some mysterious way the presence of the soldiers had become known, and about a dozen drowsy idlers had gathered. Some smuggling arrest, thought they, or maybe a deserter caught before he could get aboard a chance ship, and now to be carried back to Fort George to be shot. Two of the soldiers stationed themselves at the back of the inn, and two at the front, their yellow-and-white facings little splashes of colour in the sunlit street.

The Sheriff knocked at the door of 'The Norway Lass.' There was a sound of slow feet on the stairs inside, and the landlord's querulous voice asked, 'Wha's that? We'll ha'e the hoose open in a quarter o' an hour, man!'

'In the King's name, open the door!'

'Oh ay, King's name! Fine I ken your tricks. It's a dram ye'll be wantin''——

'I am the Sheriff of the county;' and the voice had the note of authority.

Now, the King's name in a community where smuggling of lace and brandy by sea and whisky by hill-tracks was a staple industry, and where the King's resident was a wheezy old night-watchman, might conceivably conjure up few forebodings; but the Sheriff in a Scottish county was and is the very spinal-marrow of the law.

Inside, Alasdair Grant heard the words, and a wave of dread, of relief, of mingled hopes and fears, surged over him.

In a trice the landlord's tone changed. 'I beg your pardon, my lord,' he said in a voice in which contrition, surprise, and apprehension blended. 'I'll be doon this meenit. I beg your pardon, my lord.'

There was a sound of bolts drawn, and the now fully awakened landlord opened the door.

The Sheriff and the Fiscal, with a redcoat, entered. There was a buzz from the now gathering crowd outside.

'Alasdair Grant, a "floater," is here?' said the Sheriff.

The docile landlord, with round eyes, led the way with a 'Yes, my lord. At wance, my lord.'

The Highlander was standing dressed, waiting, with a white face.

'You are Alasdair Grant?' said the Sheriff. 'I arrest you on my warrant for the wilful murder of one Walter Douglas. I have to tell you,' the level voice went on, 'that anything you may say may be used by His Majesty's advocate against you.'

He took the knife from his pocket and held it up. 'Is this your skean-dhu?' he asked.

Alasdair's eyes turned from the grave legal faces to the stolid redcoats and back again. The room spun round him. A creeping horror caught his heart; a sound of rushing waters whirled through his brain. So the Spey had betrayed him! He stood silently waiting, like some bewildered animal. Then he remembered the words 'wilful murder.'

'I—I—it was not murder,' he stammered, half to himself.

Outside, the knot of people had grown into a hushed and curious crowd, the silence broken by the clatter of the horses' harness and the voice of the river.

The Sheriff's party came out, Alasdair in their midst, his face a white mask in the bright morning. Slowly the tumult of his thoughts died down. He heard the call of the river. 'The Luck o' the Spey,' he remembered.

Suddenly, from the fringe of the crowd, a woman's voice brought the blood to his face. It was Mary's.

'Indeed'—she was talking with tossing head to the staring gossips next her, and a breath of wind carried the words to the prisoner—'indeed, and it is a shame to have this talk—talk about me and Douglas and Alasdair there. It will be over the country-side, and me promised in marriage to Andrew Matheson, at Castle Lossie, and him with a farm and two pair of horses.'

Old Morag caught the thoughtless, empty words, and muttered to herself, 'Save to them who strike for a worthless cause.' She sighed. 'A bonny lad, too, an' so many lassies in the world!'

The prisoner straightened himself at the lash of the words, and turned to the Sheriff.

'It is my skean-dhu,' he said in a steady voice. 'I killed him, and I meant to kill him.'

He gave never a look at the girl or the gaping crowd, but held out his wrists to the redcoat, shivering a little at the touch of the steel. The handcuffs snapped.

'Where shall I be hanged?' he asked without a quaver. 'They will not be taking me among my own people, my lord?'

'You will be—be tried at Castle Lossie,' said the Sheriff gently. Alasdair had been on the hill with him on many a shining August day.

The man looked down at the dog at his foot, and held out a manacled hand.

'Good-bye, Cù Math!' he whispered; and the dog held up an obedient, playful paw.

There was a jingle of bridles, an order from the corporal, the redcoats quickly closed round, and the little party was soon dislimned into a moving scarlet speck among the dusty bents, the collie gazing after his lost master with troubled brown eyes that could not understand.

THE END.

THE PIT-CAMP DWELLINGS OF HOLDERNESS.

By R. A. GATTY.

THE coast-line of Holderness is neither picturesque nor beautiful. The tourist who visits it must be prepared for disappointment if he imagines that rocks and high cliffs guard the shores of this part of Yorkshire. In their place, the sole resistance to the ever-encroaching waters of the North Sea are the boulder-clay banks—they can hardly be called cliffs—varying from ten to fifty feet in height. It is true the clay contains masses of stones and pebbles, the detritus borne from distant parts by the great ice-cap which once covered Yorkshire to a depth of two thousand feet. Among such stones may be traced fragments from the granitic mountains of Scotland and Cumberland, porphyry, mica slate, ironstone, quartz, and millstone-grit; while there occasionally appear, when the cliff has fallen or the sea has carried off some tons of material, the bones and teeth of extinct animals.

In the fight which is ever going on here between the sea and land, the victory is bound to be on the side of the water. There is nothing in the boulder-clay to resist dissolution when water attacks it, whether in the form of rain or waves. You may trace the path on the cliff-top to-day, but it may be gone to-morrow; and the ominous notices posted up to warn the visitors, 'Beware of Falling Cliffs,' adorn even the esplanade at Hornsea. The pier at this seaside resort has long since been washed away. The hotel on the cliff has had to be rebuilt twice, and at the present time extensive works are in progress to repair the esplanade, which a high tide had grievously damaged. It is a great expense and trouble this fight with the North Sea, and owners of property by the coast see their land disappear, and nothing can be done to prevent it.

There is an element of danger, too, for people who are careless when roaming about these falling cliffs. I remember, years ago, when a little boy, running away from my brother, and suddenly turning round, I went right over the cliffs backwards. I saw distinctly, before I fell, a seat full of ladies, who one and all threw up their hands. I had time at that critical moment to wonder why they did so; but the next instant I threw up my heels, and, turning a complete somersault, I landed, shaken but uninjured, on a shingle-bed fifteen feet below. You are safest walking on the fine, firm sands, which are a paradise for children, who come in crowds to get the benefit of the bracing climate. To the geologist and archæologist this district is one of the most interesting in England. The falling cliffs are a ceaseless source of instruction, and you never know what you may find in the glacial débris which has come from far and wide.

I was drawn to visit Hornsea recently on hearing that Mr William Morfitt, of Atwick, had discovered what have been termed pit-camp dwellings not far from the shore. Twenty years ago, having retired from business, Mr Morfitt settled at Atwick, near Hornsea, and he has devoted himself to the pursuit of collecting everything of interest on the shore and the land. The result is a unique series of prehistoric remains, mammoth teeth and tusks, and geological specimens. Under his guidance we went down the cliff to the beach by a zigzag path, preceded by three donkeys with wooden trays on their backs, who picked their way cleverly down a very difficult pass. They carried up shingle from the beach for road-metal—an extravagant plan, it seemed to me, for it robbed the shore of the very material needed to protect the cliffs. I found this was not the view of the inhabitants, who regard the shingle brought in by the tide as a scouring enemy destructive to the cliff foundations.

Walking north towards Bridlington, we came upon the impression of a mammoth's tusk which had fallen out of the boulder-clay and had been covered over by the sand out of our sight. A small portion of the tusk remained in the cliff. We carefully measured the length of the tusk, and found it to be five feet four inches. The next storm will possibly wash away the sand and reveal it, as its probable weight of five stone would prevent it from being carried far by the tide. A very curious thing about the movements of the waves is their power of sorting and sifting. We saw under the cliff a good deal of dark-purple-looking sand, and this proved, when examined under a glass, to contain small particles of iron, intermingled with quantities of beautiful gems, till you seemed to be looking at all the riches of the world. There were purple amethysts, garnets, topazes, aquamarines, crystals, all flashing as the sunlight caught them; and I brought away a handful of this precious sand (when magnified) to get some expert's opinion about it. Strange to say, the sifting waves always place coins among this sand; and though on that occasion I only found a farthing of George III. and a brass button, I was shown afterwards a handful of silver coins collected at various times. There were Edward pennies, Elizabeth and James shillings, with many others,

including Norwegian coins. The sand also holds small ammonites such as you see in the lias rocks impregnated with pyrites. The metallic things, having, I suppose, the same specific gravity, seem to get together. The curious thing is that the silver coins are peculiarly infectious, and whatever they touch that is metal, even when dry, they in some way poison. A gun-metal watch had its case quite eaten away by lying near the silver coins.

Another interesting relic which may be got from the cliffs is an ice-scarred stone, showing not only the deep scratches which the ice has made upon the stone but the polish which it imparted. I got out a stone from the boulder-clay which, when washed and then rubbed with the hand, had all its original polish restored, just as the ice had left it.

We quitted the beach and turned into the fields to look for flint implements and to find traces of the pit-camp dwellings. These are easily discovered on the new-sown wheat-fields. You see patches of round stones which have been brought up from the beach, and these indicate spots below which are dwellings. Later on, when the crops are up, the sites may be detected by clumps of thistles, for these always grow in the soil where a pit-camp has been placed. I inquired whether the pit-dwellings were numerous, and was told they were found in most fields. In his small garden Mr Morfitt found no less than twelve. While a field was being drained last year, one drain alone cut through five.

The discovery of these houses of prehistoric man is one which cannot fail to be of the greatest interest to archæologists. Hitherto, what we have learnt about his habits and modes of life have chiefly been from the investigation of his burial-places, such as the great collection of Canon Greenwell now in the British Museum, and from remains in caves and deposits in various parts of England. I believe it is almost unique in the experience of archæologists to unearth the home of a Stone Age man, and find his flint tools and domestic utensils *in situ*, down to his cooking-pot still lying on the cinders of the hearth. Yet this is what Mr Morfitt has brought to light, not in one isolated instance, but in more than twenty, with an unlimited number yet to be opened and investigated.

The size of the pit-dwellings varies. A large one is fifteen feet long, nine feet broad, and five feet deep. In the centre is the fireplace, made of a few rough stones, and upon this, always broken, lies the cooking-pot made of ordinary clay and hearth-baked. The drawing below gives a kind of outline of the dwelling.

It is impossible to say how this dwelling-place was covered over; but in one pit was found a rib of oak nine feet six inches long, roughly pointed at both ends. It has been suggested that this was one of the ribs which formed a roof that was either covered with skins or thatched with rushes. Sometimes the floors of these dwellings are covered with cobble-stones brought up from the beach, but most have a thick black deposit which when examined is found to be composed of reeds and rushes. Around the fireplace lie strewed the bones of animals which have been eaten, and these include ox (*Bos longifrons*), red-deer, young horse, and hare, with fragments of the bones of birds and pike. All these bones have been carefully split for extracting marrow, and stone pounders lie beside them with depressions made on two sides to fit the thumb and finger. Rude flint knives, scrapers, and hammer-stones are among the débris; and it is surprising to see what coarse tools these pit-dwellers used. There are arrow-heads with little or no work upon them, and it would seem as if they had taken no trouble in forming their implements. In fact, collectors of flints would not admit such specimens into their cabinets, which contain the exquisitely manufactured knives, arrow-heads, and scrapers found upon the surface of the fields.

After examining the pit-dwellers' implements I can only say that the ordinary collector's cabinet gives no idea of the kind of tools in daily use at that time. It is possible these pit-dwellings were only occupied temporarily, and when the people removed to another part they took with them all their good things, and left only the rubbish behind. Against this last suggestion is the fact that these places have been lived in for a very considerable time. This is proved by the soil under the fireplace, which is fire-stained for some distance down; also, round the fireplace, and of considerable thickness, is a dark-coloured substance which looks as if it had once been of a greasy nature. The same stuff still clings to the lip of the cooking-pot and forms a thick cake under it. This is very suggestive of the boiling over of the family soup, and an indication apparently that the cooking-pot was not cleaned after being used.

The form of quern found in the dwellings is of the most primitive nature—merely a flat stone with a depression worn by rubbing, into which a small rubbing-stone fits. In Suffolk flat pieces of flint are found which have been roughened by blows to triturate the grain better when rubbed upon it. In two instances fragments of broken flint axes have been found, but these are the only evidences of later neolithic workmanship. As these pit-dwellings must have lain long exposed after they were vacated, the bits of axes may have been dropped in later.

In spite of the rude quality of the pottery, which is quite without decoration, one very small cup of delicate workmanship was found. It holds exactly a teaspoonful, and is suggestive of having been used for a baby's feeding-vessel. Some of the pots have still left upon them the impress made by the fingers when they were being moulded by hand, and in one case the knuckle-marks are distinctly visible at the

bottom of the pot; but as only a woman's hand could pass into the vessel, it proves that the pot-maker was one of the gentler sex. Indications, again, of women's presence are shown by the spindle-whorls; and in one instance two beads, one made of jet (merely a square piece with a hole through it) and the other of chalk, were found. In many dwellings a red pigment is met with almost vermilion in colour, which may have formed the rouge-pot of that period.

Boars' teeth occur, sharpened at one end; and these, like the sharpened bones found in the kitchen-middens at Tierra del Fuego among the heaps of empty shells, may have been used for getting out marrow, as the latter were for extracting fish.

The careful investigations of Mr Morfitt have brought all these finds to light, and it is impossible to deny that he has made a great contribution to our knowledge of the mode of life in neolithic times. Were these pit-dwellers the first arrivals after the great ice-cap over Holderness had melted away, and palæolithic man in the south had been, like the mammoth, wiped out of existence? They seem to have been people living in the grossest state of savagery, hiding themselves in underground holes like wild beasts. The flints which Mr Morfitt has gathered from the surface of the fields are far ruder than those delicately formed implements found on the wolds a little farther north. It is true, a few polished axes have been picked up on the surface at Atwick; but it is impossible to imagine the pit-dwellers had arrived at such a stage of development as to make such beautiful weapons. At the same time, what are called polishers have been found in quantity in the pit-dwellings, and it is commonly supposed that these small half-pieces of pebble and quartzite were used for polishing the flint. If they were, no polished flint is found with them, and it seems likely they were employed for some other purpose.

It may well be said that this district of Holderness is full of interest to those who have an antiquarian taste. The evidence of the Ice Age is nowhere more apparent, and this discovery of pit-camp dwellings may take us back to that mysterious dawn of human life after the long night of ice and desolation.

THE ART OF THE ORATOR.

NOW and again we hear loud laments over the decline and decay of public speaking in this country. The alleged decline must, we fear, be frankly admitted. We are to-day without those 'lords of language' in Parliament, in the pulpit, and on the public platform whose oratory delighted and dazzled the early decades of the Victorian era. We have no Bright or Beaconsfield in the Commons, no Chalmers or Robert Hall in the Church, no great masters of assemblies like Gladstone or Daniel O'Connell.

This decline in oratorical power and brilliance may in a measure be traced to causes well known to close observers of our national history. The student of history will always find that oratory is born in epochs of intense passion and feeling. It is brought forth from the world's womb in times of travail and unrest. Catiline's conspiracy developed a crisis in Rome that produced Cicero. Philip of Macedon made possible the advent of Demosthenes. Great orators are produced by great agitations. Chatham and Burke and Webster and Phillips and Henry Ward Beecher followed the rise of great questions about conciliation with the colonies, nullification, the anti-slavery struggle, &c., by a natural sequence.

The story is told that after the Civil War in America, Wendell Phillips, the most consummate of all platform orators, who had been accustomed to address meetings with a brilliance that held unnumbered multitudes spell-bound, stood one evening before a thin and scattered audience. Turning to a friend at his side, the great orator exclaimed, 'It's no use. I shall be obliged to purchase a stereopticon.' The man was there, ready to hurl his fiery philippics, ready to display the flash of wit and thunder of appeal; but there was no cause to advocate, no wrong to redress, no enemy to battle with. The nation was at rest, and eloquence in a calm is *vox et prœterea nihil*.

Oratory is essentially the product of passion, and casts its bewitching spell only when the soul is tense, vigilant, and volcanic. The old maxim that the orator, like the poet, is born, not made, is true; but he is born not in periods of quiescence and calm but in the throes and pangs of passion and struggle.

Yet, though we must admit this decline in oratory of the highest order, there is undoubtedly a revival of interest in the art of public speaking. The world will not readily let die its pleasure in what is perhaps the greatest gift of the gods—golden-mouthed eloquence. Other gifts there are, grand and beautiful—music, poetry, song, and the like; but these, though the expression of a noble art, cannot cope in intensity or fatal fascination with the wizardy of the eloquently spoken word. There is probably no spectacle so sublime, no spell so strong and soul-moving, as to sit under the influence of a great speaker who is master of multitudes and of the spoken word. Beaconsfield once referred to a great oration of John Bright's in the significant terms: 'It was not a speech, it was an event.' The judgment was true, and accurately expressed a feeling that has often been common to large assemblies of men. During the trial of Warren Hastings, when Burke proposed that Hastings should be impeached, Sheridan spoke

for three hours with such wonderful effect that it was agreed that the Commons should adjourn and postpone its decision until the House was in a calmer and more judicial mood. Bright's great speech of 23rd February 1855 on the Crimean war —containing the memorable passage, 'The Angel of Death has been abroad throughout the land; you may almost hear the beating of his wings'—closed with an appeal to the Prime Minister that stirred the feelings of the House of Commons as it had never been stirred within living memory.

Again, the fact that men—and women too—are finding out that the public speaker possesses a power that enriches and increases the value of the individual, has done much no doubt to revive interest in the 'art of the orator.' At few periods, if any, in the history of the world were there so many opportunities of putting out his talent to profit, so many openings for its exercise and use; and the man who can deliver himself in public, who can communicate his thoughts in clear, strong, and well-chosen words, is—other things being equal —a better man and more likely to take a foremost place in life than the man who cannot. It is not only the fact that he can speak in public; but the fact that he can speak in public proves the possession of certain qualities of a rare and valuable kind that adds materially to the man's power and force of character.

And this leads me to enter in greater detail upon the 'art of the orator.'

Few subjects have produced a larger literature and body of instruction than the art of oratory; but it is only in a small and limited degree that public speaking can be taught by book or precept. Unless the aspirant has, to begin with, certain natural endowments he can never command the highest success. If, for example, he is without a certain warmth of temperament, a certain passion and afflatus of soul, his career as an orator is closed from the start. This is the true meaning of that old and familiar saying, 'The orator is born, not made.' Nature gives birth to the orator, training develops him, and practice perfects him; but given the natural and necessary qualifications without which no real progress can be made, there is no limit to future possibilities. He can learn much both from books and from the living example. Nearly all the great masters of the art, from Demosthenes to John Bright, have been close and assiduous students both of the rules of rhetoric and the best classic models. The sedulous and self-imposed exercises of Demosthenes—'the standard of perfection,' as Cicero calls him—by the seashore will occur to every schoolboy. Readers of Lord Macaulay will remember what infinite pains the younger Pitt took to acquire fluency of language and a rich and large vocabulary. John Bright is reported to have read the poet Milton every evening, and he himself admitted the vast labour given to the preparation of his speeches. Fox, whom Burke called 'the most brilliant and accomplished debater that the world ever saw,' was a close and enthusiastic student of the classics. Lord Brougham was conversant with the great masterpieces of ancient eloquence, which he knew to a great extent by heart. Chatham, who had all the natural gifts an orator could desire—a commanding presence, a graceful bearing, an eye of piercing brightness, and a voice of the utmost flexibility—was an extensively read, if not a minutely accurate, classical scholar; and it is interesting to know that Demosthenes was his favourite author, and that he diligently cultivated the faculty of expression by the practice of translation and retranslation. Lord Byron says of Grattan that he came very near to his ideal of a perfect orator, yet few great speeches show so many traces of art as his. And the list could be indefinitely lengthened.

Yet oratory is essentially an experimental art. No amount of study or theoretical instruction will suffice without incessant practice. It was the shrewd advice of Sheil to Benjamin Disraeli at the beginning of his parliamentary career to speak as often as he could, no matter how much or how little he knew of the subject before the House. The advice was based upon a true perception of the principle of progress in the art of public speaking. Oratory may, indeed, be likened to swimming. There must be the same abandonment to one's own resources, the same recklessness and risk of endeavour, the same determination to 'sink or swim' in the effort. Nothing short of actual experiment will overcome the initial difficulties of the art, the chief of which is perhaps the lack of self-possession. Self-possession is to oratory what a sure memory is to acting, or what an axle is to the wheel: it holds the whole equipment of speech in readiness and under control. A public speaker without self-possession is prisoner to a weakness which betrays him instantly. Lord Beaconsfield has a passage—perhaps autobiographical—in *Endymion* that well describes such a condition of mind: 'Endymion felt that this was the crisis of his life. He knew the subject well. It was about a week before the day arrived, and Endymion slept very little that week, and the night before his motion not a wink. He almost wished he was dead as he walked down to the House in the hope that the exercise might remedy or improve his languid circulation, but in vain; and when his name was called and he had to rise, his hands and feet were like ice. . . . It might be said that he was sustained by his despair. He felt so feeble and generally imbecile that he had not vitality enough to feel sensible or foolish. He had a kind audience, and an interested one. Then he opened his mouth; he forgot his first sentence, which he had long prepared. In trying to recall it, and failing, he was for a moment confused, but only for a moment.'

The speaker must in the first place be master of himself before he can be master of his theme, and through that master his audience. More than this is needful for the highest reaches of the art, but no

one can ever hope to scale the topmost heights who has not learned to foot this first rung of the ladder. The rest—excluding for the moment the gifts of genius—are matters of technique and expression which every man will have his own method of learning. These include such points as correct pronunciation, voice modulation, plan or arrangement of address, and, last but not least, the cultivation of a brief, terse, and pregnant style of speaking.

Dr John Clifford, one of the most popular and perhaps the most influential speaker among Nonconformist divines, describes his own method of speech-making in the following terms: 'My method is (1) to master my facts and my line of reasoning as far as possible; (2) write out what I have to say as fully as time permits; (3) rewrite—or, as the Germans say, rework—the subject; (4) "boil down" so as to get the briefest analysis of what is to be said; (5) resist the temptation to rely upon the written phrase, and leave the mind to act with all possible freedom and spontaneity; (6) make clear to myself the precise character of the results I wish to achieve, and then bend all my energies in that direction.' Based on his own experience, Dr Clifford gives the following advice to public speakers: '(1) Never forget distinctness of articulation. This is a primary consideration in effective utterance. (2) To get a vocabulary, read the best literature and mark all "elect" terms—terms that give distinction to a sentence and lift it out of the rut of wearisome commonplace. (3) To secure self-command, become self-oblivious by charging the entire mind—the emotional not less than the reflective part—with the subject and with the purpose of the speech. (4) Incessant and undespairing work is all in all.'

Mr Winston Churchill puts his faith in persevering practice: 'Make a great number of speeches. Never mind if only a score of persons are present. Treat each of them as though he were a missionary to whom you were delivering a message which he should go forth and preach. Also, if you are a good observer, you will learn as much by your speeches as you can hope to teach. Watch men's faces, and endeavour to realise how much and how little they understand, what amuses and interests them, what moves them to enthusiasm, and what leaves them listless or unmoved.'

Lord Wolverhampton says: 'My plan is to saturate my mind with the facts, and then to make a few notes of the order in which I propose to deal with them in my speech, and these notes are confined to the facts and their verification. Almost every speaker has a different method; but this is mine, and I hope—sometimes I am disappointed—that the words in which I think I can clothe the skeleton ideas will come at the right moment.'

Of present-day speakers, probably the two most instructive are Mr Chamberlain and Lord Rosebery. As a parliamentary speaker Mr Chamberlain is almost faultless. He is not eloquent, if by eloquence is meant what excites the passions or appeals to the heart; but his perfect command of simple and vigorous English, his great lucidity of statement, his power of incisive criticism, his adroitness and readiness in reply, make him an admirable subject for beginners to study. Lord Rosebery is instructive as a speaker from another point of view. His touch is lighter, more literary and discursive, than Mr Chamberlain's. Sometimes it is reminiscent of the 'grand manner' of past generations. It is full of fine, delicate shadings, exquisite word-pictures, verbal vignettes and humorous sketches, pointed not seldom by genial satire or epigram.

Whatever help the aspirant in public speaking seeks, whether from the precepts or example of great speakers, he will be driven from beginning to end to a careful study and command of words. For words, after all, form the only material the orator can use. No labour, therefore, can be too great, no endeavour too strenuous, in seeking a wide and accurate acquaintance with words. The best literature of all ages should be constantly read. This will enrich the vocabulary and give accuracy and mastery in the use of words. Command over form is only one element in the making of an orator or poet; but it is an indispensable one, and is best studied in the great creative works of the masters. It has been remarked more than once that the famous passage in Shakespeare, the speech of Mark Antony over the body of Cæsar, forms one of the most powerful and subtle specimens of modern oratory, and contains the rationale of every telling point set forth by anticipation in the *Rhetoric* of Aristotle.

The 'art of the orator' is thus seen to be a divine art. Its secrets are hidden in the mind of the great artist, in the treasure-house of Nature and God. But the germs are given to what we call men and women of genius, and by study and labour the divine art becomes a human glory and holds a listening world enchanted by the majesty and wonder and beauty of the voice of man.

UNTIL WE MEET.

RONDEAU.

Until we meet—farewell, my friend;
It may be near the journey's end,
When the dark shadows slowly creep
From the illimitable deep,
That once again our lives shall blend.

Whichever way your footsteps trend,
Good angels on your path attend,
And safely ward, and straightly keep,
Until we meet.

Perchance a kinder Fate shall bend
From high estate, and haply lend
A few brief years, that we may weep
And joy together ere death's sleep.
Fond Hope, this ray of brightness send
Until we meet!

SIXTH SERIES.

MORE ABOUT NOTABLE AUSTRALIANS.

SINCE our article on 'Notable Australians' appeared in this *Journal* for 1906, Mr Fred Johns, of the *Adelaide Observer*, has published a much enlarged edition of his biographical book under that title, and has also taken New Zealand under his wing. He has made his book retrospective as well, giving us the eminent departed since the dawn of this century. The line has been drawn at great cricketers, but Mr Johns makes quite a feature of pastoralists who have done so much to build up the Commonwealth. Scotland figures extremely well in the list of notabilities, and seems to have supplied occupants for most of the university chairs, not to mention important positions in business and political life. Additional attention has been drawn to this fact by the publication of a biography of *David Syme, the Father of Protection in Australia*, by Ambrose Pratt, with an Introduction by the Hon. Alfred Deakin (Ward, Lock, & Co.). After reading this book one realises what a strong and influential man was this son of the North Berwick schoolmaster, who became proprietor and editor of the *Melbourne Age*. No one can properly understand the history of Victoria during the past fifty years without reading it. When David Syme died, February 14, 1908, at his home at Blythewood, Kew, near Melbourne, a diagram in the *Sydney Bulletin* gave an object-lesson as to what Victorians believed he had been to Australia. An outline map of Australia was given, with a wreath hanging upon Cape York Peninsula. The rest of the Commonwealth is entirely destitute of names, save that of David Syme printed in capitals across from west to east. Below is the title, 'A Deep Mark Left on Australia.' This condenses the history of a lifetime into a few words. It is also true, as his biographer says, that 'no man dead or living has exercised a more potent influence on the course of Australian events, or has played a more intimate part in public affairs. Nevertheless, it may be doubted whether there were ever more than a few scores of private persons who would have recognised him in the street if they had chanced to meet him.' He takes his place as one of the great personalities that have made Australia. The Commonwealth needs some making yet. After mentioning a few of her notable people, we shall return to David Syme.

A recent and keen observer, with a gift for setting down his impressions, was amazed that the Commonwealth, with an area much larger than the United States and a population of about one-seventeenth of that of the great Republic, had one-fourth of her population in Sydney and Melbourne. It seemed that there was an enormous waste of opportunities going on for men to rise and hew out fortune and position, and it only remained for Australians to agree as to the method of peopling their country to direct to the Commonwealth the streams of capable and energetic Anglo-Saxons who are yearly flowing westwards. This observer also noticed a generally diffused air of comfort among people and dwellings, and from the writer's point of view 'these people have too much patriotism to let a home industry be filched from them by free importers who would buy nothing in return.' Then she is free of the curse of slum tenements, for by honest industry every family can obtain a comfortable cottage at a moderate rental. Only the other day the Federal Government appointed a lecturer to travel in the United Kingdom in order to attract population.

The *Times* recently pointed out that the consummation of Australian union at the dawn of the twentieth century definitely marks the transference of power from an old to a new order of ideas. Men of character, endurance, and enterprise developed the country in the later nineteenth century, and had a paramount influence, as we shall see in the case of David Syme, upon the whole machine of government. In the last quarter of last century power passed into the hands of representatives of the democracy, so that now we have the age of Socialism, in the sense that the social instinct which looks to the community first, and the individual afterwards, prevails in the Commonwealth. It may be also true that a greater amount of popular intelligence is brought to bear upon politics than is the case in Britain.

[*All Rights Reserved.*]

Scotland figures well, as we have said, in regard to her children who have come to the front. Mr Robert Christison, of Lammermoor, Queensland, lately purchased the estate of Burwell Park, Lincolnshire, and has come back to this country to reside. A son of the minister of Foulden, he was founder of the first export meat-works in the colony, and has been a large importer of stud Hereford cattle and thoroughbred horses from England. Sir Malcolm M'Eacharn, steamship-owner, merchant, contractor, and former Mayor of Melbourne, has bought an estate in the south of Scotland which belonged to Lord Galloway, where he means to reside. Sir Malcolm was born in Islay in 1852, and his firm was early engaged in the frozen-meat trade, while he has also entered extensively into pastoral pursuits and sugar-growing in Queensland. Colonel James Burns, born near Edinburgh in 1846, left for Australia at sixteen, and dates his first success from a store at Townsville, Queensland. He is founder and director of Messrs Burns, Philip, & Co., Sydney, which owns many trading steamers, and is one of the great businesses of the southern hemisphere. Colonel Burns is chairman of a large pastoral company, president of the Highland Society of New South Wales, and resides on a fine estate, Gowan Brae, near Parramatta. Another leading pastoralist in Queensland is Robert Gray, born at Hughenden Manor, Buckinghamshire. He served under Sir Colin Campbell at Lucknow, and was present at its capture in 1858. Later he held various appointments in India, retiring from the army in 1863. When he settled at Hughenden, North Queensland, his wife, who accompanied him, was the first white woman to come to that district. William Collins is another notable Queensland pastoralist who has done much in association with Messrs M'Ilwraith and Forrest in opening up the country, and he has laid down artesian bores and sub-artesian bores on various stations, and has been associated with M'Ilwraith, M'Eacharn, & Co. in the first successful shipment of frozen beef and mutton from Sydney and Melbourne in the steamship *Strathleven*. Mr F. Sadlier Falkiner, who came from Ireland to Victoria in 1853, is one of the most successful sheep-breeders in Australia, and his Roonoke merino stud is considered one of the first in the world. The late James Inglis, born at Edzell, Forfarshire, in 1845, a Sydney merchant, who died in 1908, was in turn journalist and indigo-planter, and published a racy semi-autobiographical book, *Oor Ain Folk*, containing stories of Forfarshire, besides writing on tea and his travels in India and New Zealand. During the residence of that now well-known poet and prose writer Mr Will. H. Ogilvie in Australia, one volume of his verse had a circulation of over ten thousand copies.

The bulk of the professors in the universities of the southern hemisphere, as we have said, hail from Scotland. Professor James Gow Black, of the Chemistry Chair, Otago, born at Dunkeld, Perthshire, is the original of Ian Maclaren's John Ross in *The Days of Auld Langsyne*. Professor David Orme Masson, of the Chemistry Chair in the University of Melbourne, is a son of the late Professor David Masson, and was born in London in 1858. Professor Mitchell, of the Philosophy Chair in the University of Adelaide, was born at Inveravon, Banffshire, in 1861, and has published a work on the *Structure and Growth of the Mind*. Mr F. S. Peterson, Ormond Professor of Music, University of Melbourne, was born at Edinburgh in 1861. The bacteriologist to the Linnean Society of New South Wales, Mr R. Greig-Smith, is also a native of Edinburgh; so is Professor Haswell of the Biological Chair in the University of Sydney; as well as Dr H. Laurie, Professor of Mental and Moral Philosophy in the University of Melbourne; and the Rev. N. Salmond, Professor of Mental and Moral Philosophy, University of Otago. Dr Alexander MacCormick, lecturer on Surgery in Sydney University, is second to none as a surgeon to the Antipodes. Other professors of Scottish origin are Mr H. S. Carslaw, who was born at Helensburgh in 1870, and is Professor of Mathematics in the University of Sydney; Mr Francis Anderson, the Professor of Logic and Mental Philosophy, University of Sydney, hails from Glasgow; Mr Hugh MacKenzie, Professor of English Language and Literature, Victoria College, Wellington, was born at Ardross, Ross-shire, in 1861.

We pass from pastoralists and professors, however, to say something of David Syme. The great Australian journalist—'King David of Melbourne,' as he came to be called—the son of a parish schoolmaster of North Berwick, was born there on 2nd October 1827. The youngest of the seven children of George Syme and Jean Mitchell, David had his education until sixteen under his father's Spartan discipline. The routine was out of bed at 7 A.M., books till breakfast-time, and school till 4 P.M., with half-an-hour for dinner; no companions nor time for play. The health of the boy suffered, but his father was a man of few words, and the rôle of the son was strict obedience. Three sons from the North Berwick home went to the university, although the schoolmaster was passing rich on forty pounds a year. David Syme studied for two years for the Evangelical Union Church of Scotland, stopped short of being a minister, went to Germany, and on his return filled a situation as reader on a Glasgow newspaper. Smitten with the gold-fever, Syme took the five months' voyage to California, but on landing liked neither the gold-diggings nor the people he met there, and early in 1852 crossed the Pacific to Melbourne, with a slender supply of money in his pocket. After some experience of the goldfields at Castlemaine and Korong, where he was robbed by a chum, he returned to Melbourne, joined his brother Ebenezer, who was editing the *Melbourne Age*, then the only Liberal paper, for a co-operative society of journalists, printers, and workers.

David Syme had brought some little money with him from the goldfields, and embarked with his brother in the speculation of the purchase of the

Age for two thousand pounds. The first number under their management appeared on 12th June 1856. The energies of David Syme at this period were not entirely confined to the newspaper, for we find him in business as a contractor, making roads and bridges, and being on the verge of success when his brother Ebenezer died, and he took up the editorship and management of the *Age*. In 1858 he married Annabella Johnson, from Yorkshire, by whom he had five sons and four daughters.

With small capital to start with, for a decade Syme worked more than fifteen hours a day. The state of his health once made a voyage to Europe desirable. All the doctors he consulted before going said his lungs were affected. He got the truth on his return from one, a new start who had never seen him before, that it was the liver that tormented him. In his paper he was at first on the unpopular side, and his enemies tried in many ways to ruin him; the shortest cut seemed to be the withdrawal of advertisements from the *Age*. In a single day it shrank to half its size, and had to depend upon its circulation. Syme stuck to his guns, reduced the price of his paper from sixpence to threepence, and became his own editor, leader-writer, and manager. He beat the Free Traders in the end; and in 1864, after four years' desperate struggle, a Protectionist majority was returned to Parliament. At first the *Age* stood alone for Protection, and gradually worked people and Parliament round. Another tough battle was against the selfishness of the pastoralist or squatting interest holding up immense blocks of land. In 1856, when Syme took up his newspaper duties, he was only too painfully conscious of thousands of emigrants trooping out of the country who might have settled and added to the wealth of the community could they have got land to settle on. Syme's campaign was successful in pointing out the danger and the remedy. Victoria began to realise the danger; and Parliament, in obedience to the public will, wrested the monopoly of the soil from those who held it. Between 1868 and 1878 over eleven million acres of agricultural land were acquired by small resident pastoral and family settlers. In analysing the Free Trade tariff of the United Kingdom, he had declared it a sham, as it gave protection to most of the industries save agriculture. He said that the expression Free Trade sounded well, but asked if it was more than a sounding phrase, a mere theory, anything more than a mere expedient of the domestic policy of a state. During those strenuous days, his biographer says, 'with his back to the wall, fighting for more than life, he plodded on, a prodigy of physical endurance and mental productivity. His leaders, conceived in turmoil and scribbled down on odd bits of paper in moments suited for his meals and in the intervals of business cares, display a fire and a passion, a love and a faith in the democracy, that stir the blood even now.'

When increased prosperity came to Victoria an era of boom and extravagance set in, and the colony seemed racing to ruin. Syme analysed and attacked proposals for a vast expenditure on new railways, and killed the schemes. One financial magnate made the matter a personal one, and sued Syme for twenty-five thousand pounds for libel. After three years of worry and vexation, Syme was vindicated at a cost to himself of fifty thousand pounds, while he had saved the country an expenditure of over forty millions. A townsman, in acknowledging this achievement, remarked that when the history of the colony came to be written, one of the finest of its pages would be one which described how the community, stricken with summer madness, was awakened to appreciation of the danger by Syme. These proposed railways have not yet been made. He showed his public spirit by sending a rifle team to Bisley, subscribed largely to the Boer war contingents, sent a scientific expedition to the heart of Australia, and gave an endowment to Melbourne University for scientific research.

David Syme had a splendid physique, was of commanding height and striking appearance, more revered than loved, and in a mixed company he towered mentally and physically above those around him. The force and penetration of his mind are seen in the fact that while he was a power no single Liberal progressive Act found its way to the statute book which he did not wholly or partially originate. His individuality was sunk in his paper; he seldom attended a public meeting or appeared on a public platform, and the people of Melbourne scarcely knew him by sight. But though he held aloof from the people, his life was devoted to their interests, and his three greatest battles against land-monopoly, Cobdenism, and State extravagance were won in their interests. This influence was gained because the people believed in his honesty of purpose, and because he interpreted and represented and guided public opinion on the questions of the day. When his career was at its strenuous stage he used to breakfast at eight, read the papers through, then ride into town, arriving at the office about ten-thirty or eleven. His first work was to attend to the financial and publishing affairs; then he arranged the duties of his reporting staff, which consisted of three. At 3 P.M. he met his leader-writers, found subjects for them, and instructed them as to the form of the articles. Then he read till tea-time to find new matter. After that he read the proofs that poured in till midnight. Often he would rewrite a leading article. This went on till two in the morning, when the paper had to go to press. He rode home, and seldom got to sleep before three in the morning. Such was his daily grind for more than a decade.

He made many enemies but also many friends. When the pursuer in the railway action became impecunious he assisted him. 'One day a friend, who had been a fellow-contractor of Syme's before his brother Ebenezer's death, called at the office. He found David in the deepest dejection. Things were going very badly with the poor journalist, and ruin stared him in the face. The contractor was

intimate enough with him to insist upon his confidence. When he heard all he promptly decided to prove his friendship in a practical way, and pulled out his cheque-book. "It will take hundreds," said David Syme. "Well," replied the contractor, "you can have hundreds."

'The money was lent, and very soon repaid. Ten years later Syme heard that his good friend was menaced with bankruptcy. He hurried to his side and offered help. "It will take thousands," said the contractor. "Well, you can have thousands," was Syme's smiling reply, and he put a cheque signed in blank in the other's hand.'

Australia, the greatest pastoral country in the world, with a glorious climate, has to fight with terrible droughts and the rabbit-pest, but is sending us continually increasing quantities of gold, wool, dairy produce, and frozen mutton. Her sons are loyal to the flag, and promptly responded to our need during the Boer war. If labour does not kill the goose that lays the golden egg, and proves only less tyrannical than capital may be, an even more golden age than the past may lie ahead of the Commonwealth, which is developing 'a continent for a nation and a nation for a continent.'

THE HOUSE OF WHISPERS.

CHAPTER IX.—REVEALS A MYSTERIOUS BUSINESS.

IN the few days which followed, Lady Heyburn's attitude towards Gabrielle became one of marked affection. She even kissed her in the breakfast-room each morning, called her 'dear,' and consulted her upon the day's arrangements.

Poor Sir Henry was but a cipher in the household. He usually took all his meals alone, except dinner, and was very seldom seen, save perhaps when he would come out for an hour or so to walk in the park, led by his daughter, or else alone, tapping before him with his stout stick. On such occasions he would wear a pair of big blue spectacles, to hide the unsightliness of his gray, filmy eyes. Sometimes he would sit on one of the garden-seats on the south side of the house, enjoying the sunshine, and listening to the songs of the birds, the hum of the insects, and the soft ripples of the burn far below. And on such occasions one of his wife's guests would join him to chat and cheer him, for every one felt pity for the lonely man living his life of darkness.

No one was more full of words of sympathy than James Flockart. Gabrielle longed to warn her father of that man, but dared not do so. There was a reason—a strong reason—for her silence. Sir Henry had declared that he was interested in the man's intellectual conversation, and that he rather liked him, though he had never looked upon his face. In some things the old gentleman was ever ready to adopt his daughter's advice and rely upon her judgment; but in others he was quite obstinate, and treated her pointed remarks with calm indifference.

One day, at Lady Heyburn's suggestion, Gabrielle, accompanied by Flockart and another of the guests, a retired colonel, had driven over in the big car to Perth to make a call; and on their return she spent some hours in the library with her father, attending to his correspondence.

That morning a big packet of those typed reports in French had arrived in the usual registered, orange-coloured envelope, and after she had read them over to the Baronet, he had given her the key, and she had got out the code-book. Then, at his instructions, she had written upon a yellow telegraph-form a cipher message addressed to the mysterious 'Meteforos, Paris.' It read, when decoded:

'Arrange with amethyst. I agree the price of pearls. Have no fear of Smithson, but watch Peters. If London refuses, then Mayfair. Expect report of Bedford.'

It was not signed by the Baronet's name, but by the signature he always used on such telegraphic replies: 'Senrab.'

From such a despatch she could gather nothing. At his request she took away the little blue-covered book and relocked it in the safe. Then she rang for Hill, and told him to send the despatch by messenger down to Auchterarder village.

'Very well, miss,' replied the man, bowing. 'The car is going down to take Mr Seymour to the station in about a quarter of an hour, so Stokes will take it.'

'And look here,' exclaimed the blind man, who was standing before the window with his back to the crimson sunset, 'you can tell her ladyship, Hill, that I'm very busy, and I sha'n't come in to dinner to-night. Just serve a snack here for me, will you?'

'Very well, Sir Henry,' responded the smart footman; and, bowing again, he closed the door.

'May I dine with you, dad?' asked the girl. 'There are two or three people invited to-night, and they don't interest me in the least.'

'My dear child, what do you mean? Why, aren't Walter Murie and his mother dining here to-night? I know your mother invited them ten days ago.'

'Oh, why, yes,' replied the girl rather lamely; 'I did not recollect. Then, I suppose, I must put in an appearance,' she sighed.

'Suppose!' he echoed. 'What would Walter think if you elected to dine with me instead of meeting him at table?'

'Now, dad, it is really unkind of you!' she said

reprovingly. 'Walter and I thoroughly understand each other. He's not surprised at anything I do.'

'Ah!' laughed the sightless man, 'he's already beginning to understand the feminine perverseness, eh? Well, my child, dine here with me if you wish, by all means. Tell Hill to lay the table for two. We have lots of work to do afterwards.'

So the bell was rung again, and Hill was informed that Miss Gabrielle would dine with her father in the library.

Then they turned again to the Baronet's mysterious private affairs; and when she had seated herself at the typewriter and reread the reports—confidential reports they were, but framed in a manner which only the old man himself could understand—he dictated to her cryptic replies, the true nature of which were to her a mystery.

The last of the reports, brief and unsigned, read as follows:

'Mon petit garçon est très gravement malade, et je supplie Dieu à genoux de ne pas me punir si severement, de ne pas me prendre mon enfant.

'D'apres le dernier bulletin du Professeur Kniebergen, il a la fièvre scarlatine, et l'issue de la maladie est incertaine. Je ne quitte plus son chevet. Et sans cesse je me dis, "C'est une punition du Ciel."'

Gabrielle saw that, to the outside world, it was a statement by a frantic mother that her child had caught scarlet-fever. 'What could it really mean?' she wondered.

Slowly she read it, and as she did so noticed the curious effect it had upon her father, seated as he was in the deep saddle-bag chair. His face grew very grave, his thin white hands clenched themselves, and there was an unusually bitter expression about his mouth.

'Eh?' he asked, as though not quite certain of the words. 'Read it again, child, slower. I—I have to think.'

She obeyed, wondering if the key to the cryptic message were contained in some conjunction of letters or words. It seemed as though, in imagination, he was setting it down before him as she pronounced the words. This was often so. At times he would have reports repeated to him over and over again.

'Ah!' he gasped at last, drawing a long breath, his hands still tightly clenched, his countenance haggard and drawn. 'I—I expected that. And so it has come—at last!'

'What, dad?' asked the girl in surprise, staring at the crisp typewritten sheet before her.

'Oh, well, nothing, child—nothing,' he answered, bestirring himself.

'But the lady, whoever she is, seems terribly concerned about her little boy. The judgment of Heaven, she calls it.'

'And well she may, Gabrielle,' he answered in a hoarse, strained voice. 'Well she may, my dear. It is a punishment sent upon the wicked.'

'Is the mother wicked, then?' asked the girl in curiosity.

'No, dear,' he urged. 'Don't try to understand, for you can never do that. These reports convey to me alone the truth. They are intended to mislead you, as they mislead other people.'

'Then there is no little boy suffering from scarlet-fever?'

'Yes. Because it is written there,' was his smiling reply. 'But it only refers to an imaginary child, and, by so doing, places a surprising and alarming truth before me.'

'Is the matter so very serious, dad?' she asked, noticing the curious effect the words had had upon him.

'Serious!' he echoed, leaning forward in his chair. 'Yes,' he answered in a low voice, 'it is very serious, child, both to me and to you.'

'I don't understand you, dad,' she exclaimed, walking to his chair, throwing herself upon her knees, and placing her arms around his neck. 'Won't you be more explicit? Won't you tell me the truth? Surely you can rely upon my secrecy?'

'Yes, child,' he said, groping until his hand fell upon her hair, and then stroking it tenderly; 'I trust you. You keep my affairs from those people who seek to obtain knowledge of them. Without you, I would be compelled to employ a secretary; but he could be bought, without a doubt. Most secretaries can.'

'Ford was very trustworthy, was he not?'

'Yes, poor Ford,' he sighed. 'When he died I lost my right hand. But fortunately you were old enough to take his place.'

'But in a case like this, when you are worried and excited, as you are at this moment, why not confide in me and allow me to help you?' she suggested. 'You see that, although I act as your secretary, dad, I know nothing of the nature of your business.'

'And forgive me for speaking very plainly, child, I do not intend that you should,' the old man said.

'Because you cannot trust me!' she pouted. 'You think that because I'm a woman I cannot keep a secret.'

'Not at all,' he said. 'I place every confidence in you, dear. You are the only real friend left to me in the whole world. I know that you would never willingly betray me to my enemies; but'——

'Well, but what?'

'But you might do so unknowingly. You might by one single chance-word place me within the power of those who seek my downfall.'

'Who seeks your downfall, dad?' she asked very seriously.

'That's a matter which I desire to keep to myself. Unfortunately, I do not know the identity of my enemies; hence I am compelled to keep from you certain matters which, in other circumstances, you might know. But,' he added, 'this is not the first time we've discussed this question, Gabrielle dear. You are my daughter, and I trust you. Do not,

child, misjudge me by suspecting that I doubt your loyalty.'

'I don't, dad; only sometimes I'——

'Sometimes you think,' he said, still stroking her hair—'you think that I ought to tell you the reason I receive all these reports from Paris, and their real significance. Well, to tell the truth, dear, it is best that you should not know. If you reflect for a moment,' went on the old man, tears welling slowly in his filmy, sightless eyes, 'you will realise my unhappy situation—how I am compelled to hide my affairs even from Lady Heyburn herself. Does she ever question you regarding them?'

'She used to at one time; but she refrains nowadays, for I would tell her nothing.'

'Has any one else ever tried to glean information from you?' he inquired, after a long breath.

'Mr Flockart has done so on several occasions of late. But I pleaded absolute ignorance.'

'Oh, Flockart has been asking you, has he?' remarked her father with surprise. 'Well, I suppose it is only natural. A blind man's doings are always more or less a mystery to the world.'

'I don't like Mr Flockart, dad,' she said.

'So you've remarked before, my dear,' her father replied. 'Of course you are right in withholding any information upon a subject which is my own affair; yet, on the other hand, you should always remember that he is your mother's very good friend—and yours also.'

'Mine!' gasped the girl, starting up. Would that she were free to tell the poor, blind, helpless man the ghastly truth! 'My friend, dad! What makes you think that?'

'Because he is always singing your praises, both to me and to your mother.'

'Then I tell you that his expressions of opinion are false, dear dad.'

'How?'

She was silent. She dared not tell her father the reason; therefore, in order to turn the subject, she replied, with a forced laugh, 'Oh, well, of course I may be mistaken; but that's my opinion.'

'A mere prejudice, child; I'm sure it is. As far as I know, Flockart is quite an excellent fellow, and is most kind both to your mother and to myself.'

Gabrielle's brow contracted. Disengaging herself, she rose to her feet, and, after a pause, asked, 'What reply shall I send to the report, dad?'

'Ah, that report!' gasped the man, huddled up in his chair in serious reflection. 'That report!' he repeated, rising to straighten himself. 'Reply in these words: "No effort is to be made to save the child's life. On the contrary, it is to be so neglected as to produce a fatal termination."'

The girl had seated herself at the typewriter and rapidly clicked out the words in French—words that seemed ominous enough, and yet the true meaning of which she never dreamed. She was thinking only of her father's misplaced friendship in James Flockart. If she dared to tell him the naked truth! Oh, if her poor, blind, afflicted father could only see!

(To be continued.)

CHARLES KIRKPATRICK SHARPE.

By Lord Ronald Sutherland Gower.

HAVE always taken an interest in the old antiquary whose name appears above, for Sharpe was a link between old and modern Scotland. He could recall the days when the Old Town of Edinburgh housed the wealthiest and most ancient Scottish families, and he was still more interesting as being the friend and correspondent of Sir Walter Scott, who called him the 'Scottish Horace Walpole.' I have a faint recollection of being taken by my father, who was his lifelong friend, to see Sharpe more than half a century ago in Edinburgh; this must have been in the autumn of 1851 or early in 1852, the year he died.

Charles Kirkpatrick Sharpe came of a good old stock, the baronial family of Kirkpatrick of Closeburn being one of the oldest in the south of Scotland. It is recorded that Charles, Duke of Queensberry, husband of Duchess 'Peggy,' the friend of Gay the poet, and a famous *frondeuse* of the Court of George II., showed his high regard for the family of Kirkpatrick in the following manner: Driving one day with his Duchess to take part in an election at Dumfries, the Duke saw the coach of Sir Thomas Kirkpatrick, who was opposed to him in politics, coming in the same direction. The Duchess, fearing that Sir Thomas would come into the town first, shouted to her coachman to drive faster and prevent the other coach from passing, 'Else,' she cried, 'Tom of Closeburn will get in before us and lick the butter off our bread.' The Duke turned to his wife and thus rebuked her: 'Let me tell you, my lady Duchess, that Tom's ancestor was Knight of Closeburn while mine was gudeman of Drumlaury.'

Charles Sharpe's father was the son of a younger brother of this Sir Thomas Kirkpatrick, and could trace his descent from the family of John, Earl of Mar, that Earl being his great-grandfather; his Countess was a daughter of the ducal house of Lennox. Through his grandmother, Lady Susan Renton, he claimed kindred with the house of Eglintoun. Charles's father had assumed the name of Sharpe according to the will of his mother's great-uncle, Matthew Sharpe of Hoddam, from whom he inherited that estate, but he always preferred the name of Kirkpatrick, and employed his pencil in illustrating his descent from that family, the Mars,

the Stewarts, the Dundases, and the Eglintouns. Hoddam is an Annandale parish, in south Dumfries, in which is Carlyle's birthplace, Ecclefechan. The fourth Earl of Southesk sold the parcel of Hoddam in 1690 to John Sharpe, whose line, passing on the distaff-side through the Kirkpatricks, ended in four brothers—General Sharpe, who represented Dumfries in Parliament from 1832 to 1841; Charles, the subject of this sketch; and his two younger brothers, Edward Alexander, who died in 1858, and William, who died in 1875. Hoddam is a good specimen of an old Scottish fortified house. It is situated among finely wooded hills on the west bank of the river Annan, a picturesque tributary of the Solway, and originally was an old square beacon-tower dating from the fifteenth century, and, standing on the oddly named 'Hill of Repentance,' was called the Tower of Repentance. The building was much enlarged by General Sharpe in the early part of the nineteenth century, and now belongs to Mr E. Brook.

Here Charles was born in the month of May 1781. Of his early years there are no records save that he attended Dr Robinson's school in Edinburgh from 1796 to 1797. In 1798 he went to Christ Church at Oxford, where in 1802 he took his degree. He appears to have greatly disliked his tutor, whom he describes as 'unmannerly and disgusting;' and even the stately and important head of Christ Church, Dr Cyril Jackson, he calls 'an inspired swine.' In his letters he also sneered at his fellow-collegians, but he made some friendships at the University which lasted throughout his life. Among these was that with my father, the then Lord Gower; with him and also with his mother, the Duchess-Countess of Sutherland, he maintained a lifelong correspondence.

Whilst he was at Christ Church, Sharpe had some thoughts of writing a satire on the University after the manner of the famous *New Bath Guide;* but only a fragment of what he wrote has been preserved. Despite his dislike of the University, he seems to have been popular at Christ Church, where his drawings and caricatures were highly esteemed. One of the best of the satirical poems that he wrote at this period was upon the notorious Thomas Paine. It commences as follows:

> Hail! sacred light of Reason, Paine refined,
> New blessing to the long-benighted mind;

and so on for fifteen lines.

By far the most interesting event in Sharpe's life at Oxford was his acquaintance with Walter Scott. It was in 1802 that the first two volumes of the *Minstrelsy of the Scottish Border* appeared; and so interested was Sharpe in their publication that he wrote to the editor, with the result that two ballads by him appeared in the third volume of the *Minstrelsy*, published in 1803. These two ballads elicited the praise of the then well-known authoress Anna Seward, and a letter written by her in the same year to Scott led to Sharpe's first introduction to the 'Great Unknown.' The meeting took place at Oxford. In one of his home-letters Sharpe writes that he invited 'this Border Minstrel' to breakfast, probably in his rooms at Christ Church. 'He is much too poetical,' he said of Scott. 'He spouts without mercy, and pays compliments so high-flown that my self-conceit, though a tolerable good shot, could not wing even one of them; but he told me that he intended to present me with the new edition of his book, and I found comfort in that.'

Although this first meeting does not sound promising for the future acquaintance of the two men, it led to a lifelong friendship. 'Talking of fair ladies,' writes Walter Scott to Lady Louisa Stuart in January 1808, 'reminds me of Mr Sharpe's ballads; they exhibit, I think, a very considerable portion of imagination, and occasionally, though not uniformly, great flow of versification. There is one verse, or rather a whole description of a musical ghost-lady sitting among the ruins of her father's tower, that pleased me very much. But his language is too flowery and even tawdry, and I quarrel with a lady in the first poem who yielded up her affection upon her lover showing his white teeth. White teeth ought to be taken great care of, but I cannot allow them to be an object of passionate admiration; it is too like subduing a lady's heart by grinning.'

Sharpe had a great liking for Keppel Craven and his mother, the Margravine of Anspach, and a large proportion of the correspondence, which fills two large volumes, published in 1888 by Blackwood is letters from the mother and son to Sharpe, and his letters to them. 'Everybody,' writes Sharpe—'everybody knows that she [the Margravine] was the daughter of Lord Berkeley, and first married Lord Craven. When I was acquainted with her she had the remains of much beauty; but she disfigured herself with an immense quantity of rouge and burnt cork, as I think, on her eyebrows. She was very graceful, and could assume, when she pleased, the manners of the best times; she composed music prettily, but spoilt her own songs with a cracked voice; she danced well, and was an excellent shot. I am told that she was a tolerable actress, and extremely fond of exhibiting herself on the stage. . . . Her life, if faithfully written, would make a most extraordinary book.'

At the Margravine's home, Benham, Sharpe met Gell the antiquary (nicknamed 'Topographical Gell'), and an old beau, Sir Lumley Skeffington, whom he thus described: 'He painted his cheeks and wore a black wig of horsehair, and was the most frightful of all the hideous dandies I ever beheld, but with an excellent heart and very good-natured.' One evening there were theatricals at Benham, in which Sharpe, with Keppel Craven and old Sir Lumley, acted the play (doubtless Nat Lee's) called *Alexander the Great*, Keppel taking the part of the King, Sir Lumley that of Roxana. 'The audience,' writes Sharpe, 'were in raptures, especially with Statira's death, who was stabbed with a faggot-stick and expired upon the lapdog's cushion.'

Matthew Lewis, called 'Monk Lewis,' was also one of Charles's friends, and in 1812 addressed him in a flowery ode.

The unfortunate Princess of Wales, Caroline of Brunswick, was also an acquaintance of Sharpe's; and although he was very seldom charitable in his opinions of people, he would never admit her guilt; and, writing of her, he says: 'Before I had the honour of being acquainted with her I had heard many reports of her unchastity. I never saw anything to confirm this. She had much *esprit* and talked as freely as many clever and most virtuous women of the highest rank whom I have known both in Scotland and England used to do. This is no proof of incontinence. There is an old Scotch proverb, "The silent soo eats a' the draff."' Of George IV. Sharpe had as ill an opinion as Charles Greville or Creevey; he calls him 'a filthy piece of crustiness.'

He tells a curious story of the Princess Caroline. She was sitting alone in her room very soon after the death of her father, the Duke of Brunswick. A puff of wind blew the smoke down the chimney, and in the cloud of smoke she saw the form of the Duke quite plainly.

Although Sharpe was a good letter-writer, he cannot be compared in that respect to Horace Walpole, but he deserves to be remembered for the part he took in the revival of a taste for medieval art and for the protection he gave in his native land to all that was worth preserving of an older time. His love and veneration for old buildings, old ballads, old traditions, and all that belongs to the hobby of the antiquary and collector, he shared with Walter Scott, and this sympathy of interest was the tie that bound them together.

In 1808 Sharpe made a present to Scott of one of his cleverest caricatures—that of Queen Elizabeth dancing 'high and disposedly' before the Scottish ambassador, who is looking at her capering Majesty from the opening of a curtain; the sketch is irresistibly comic, and places the author among the ablest caricaturists of his day. Walter Scott treasured this drawing greatly. Sharpe sketched mostly in sepia and in water-colours, and he also made some good etchings of old buildings and of ancient portraits; among the best of the latter being the heads of Claverhouse and his wife. But he was not happy in his imaginary designs, some of which are almost as repellent in their morbid unhealthiness as those of Aubrey Beardsley.

That Sharpe was of service to Scott not only in his work on old ballads, but also with regard to the personal history of old Scottish families, is proved by their correspondence. No one knew the inner story of the Scottish peerage, its ramifications and alliances, its scandals and skeletons in the cupboard, so well and so intimately as did Sharpe. Every *cause célèbre* of the two last centuries in the families of the old Scottish nobility was at his finger-ends; and, although he never accomplished any serious historical work, he wrote a lengthy fragment relating to Mary Stuart, of whom, like most Scotsmen, he was an ardent admirer and apologist. Scott must have had a high opinion of his friend's literary power when he recommended that Sharpe should be asked to join the staff of the *Quarterly Review* when it was founded in 1808.

When he was at Oxford, Sharpe commenced collecting and buying portraits by Lely and Vandyck, and all through his long life he was adding to his collection; one regrets that all his treasures were dispersed after his death.

Sharpe's father died in 1813, and the son migrated from Hoddam to Edinburgh, in order to be with his mother, to whom he was devotedly attached; and until his death, forty years later, he lived almost wholly in the city, paying only short visits to Hoddam. His health was never good, and for the remainder of his life he led the existence of an invalid, never going anywhere or visiting. He first took a house in Princes Street, No. 93, which he soon filled with his pictures and curios, his books and old furniture, and from here he corresponded with Walter Scott, David Laing, Thomas Thomson, and others of his literary friends. It is worth recording that Scott occasionally commenced his letters to his friend, 'My dearest Sharpe,' an expression he ordinarily used only in writing to his nearest relations.

Sharpe was always well occupied. He edited various works, and was a contributor to *Constable's Edinburgh Magazine*. He also began writing a play of which Monmouth was the subject. In 1818 Ballantyne published Law's *Memorials*, to which were appended a preface and notes by Sharpe regarding that strange work of legendary lore. Books relating to ancient ballads followed the above, and in 1823 Sharpe published a small volume of ballads for private circulation, the first page of which was headed with a beautiful little vignette from his pen, an etching worthy of Hollar or Callot. About this time he made some illustrations for David Laing's *Fugitive Scottish Poetry*, and for the reprint of Lady Anne Barnard's *Auld Robin Gray*. He also illustrated some books of Scottish family history, amongst others a delightfully quaint old book of manners, Petrie's *Rules of Good Deportment*, for which he drew an Hogarthian title-page. He likewise annotated Sir Robert Douglas's *Scottish Peerage*. No one was better qualified than Sharpe, from his knowledge of Scottish family history, to impart some life to the solemn work of Douglas; in fact, his notes make this *Peerage* the most readable of any, but it has never been printed in the annotated form.

Sharpe was of use in his generation by protesting against the scandalous manner in which Edinburgh was being modernised. He hated to see the old buildings of Dunedin destroyed, and disliked and derided the classical edifices which were rising on the Mound and on Calton Hill. He was never tired of writing against these municipal atrocities—'Athenian improvements' he calls them in grim irony. But he especially inveighed against

the alterations which were being carried out in the Castle. 'Though I have lived to see,' he writes, 'in the course of forty years the Old Town lose much of its primitive features from unavoidable decay, from the rage for "improvement," and the less destructive element of fire, I did not expect to witness such a bold attack as this upon the Rock and Castle of Edinburgh. Surely our city projectors have forgotten the adage of Drummond of Hawthornden, which should be remembered for more reasons than one: "*Les murailles et les forteresses sont au Roy, personne ne peut abaisser de son biens au préjudice de son souverainete.*"' All that was left of Old Edinburgh was dear to Sharpe's heart, and he writes to the city architect: 'All is horror and surprise at the vandalism that is being perpetrated upon the Castle.'

After 1830 he wrote little and kept no letters. This was probably owing to the action of Lady Charlotte Bury, a former friend of his, who published some of his letters to her without previously asking his permission—an inconsideration which galled him terribly, and made him very chary of writing letters afterwards even to his friends. Sharpe lived on in a house to which he had moved in Drummond Place, No. 26, and it was there that I can remember being taken by my father, and can recall the old gentleman in his brown wig, a somewhat gruesome object.

Sir Walter Scott has summed up Sharpe's character in the following description, written in his diary in 1825: 'Charles Kirkpatrick Sharpe is another very remarkable man. He was bred a clergyman, but did not take orders owing, I believe, to a peculiar effeminacy of voice, which must have been unpleasant in reading prayers. Some family quarrels occasioned his being indifferently provided for by a small annuity from his elder brother, extorted by an arbitral decree. He has infinite wit and a great turn for antiquarian lore, as the publications of Kirkton, &c., bear witness.' This refers to a book Sharpe had (not out of love for the Kirk!) edited in 1817, called *A Secret and True History of the Church of Scotland from the Restoration to the Year 1628*. 'His drawings are the most fanciful and droll imaginable, a mixture between Hogarth and some of those foreign masters who painted temptations of Saint Anthony and such grotesque subjects. As a poet he has not a very strong touch. Strange that his finger-ends can describe so well what he cannot bring out clearly and firmly in words. If he were to make drawing a resource it might raise him a large income. But though a lover of antiquities, and therefore of expensive trifles, C. K. S. is too aristocratic to use his art to assist his revenue. He is a very complete genealogist, and has made many detections in Douglas's and other books of pedigree, which our nobles would do well to suppress if they have an opportunity. Strange that a man should be curious in scandals centuries old; not but that Charles loves it fresh and fresh also, for, being very much a fashionable man, he is always master of the reigning report, and he tells the anecdote with such gusto that there is no helping sympathising with him, the peculiarity of voice adding not a little to the general effect. My idea is that C. K. S., with his oddities, taste, satire, and high aristocratic feelings, resembles Horace Walpole—perhaps in his person also in a general way.'

Many years after this description of Sharpe was written by Scott, another author and antiquary, John Hill Burton, in that delightful work *The Book Hunter*, describes the oddities of the old antiquary Fitzpatrick Smart, which stands for Kirkpatrick Sharpe. Burton describes him at some length, commencing with his books and his picture-collecting, and he sums him up by saying that after all 'he was himself his own greatest curiosity. . . . He had come to manhood just after the period of gold-laced waistcoats, small-clothes, and shoe-buckles, otherwise he would have been a living memorial of these now antique habits; it happened to be his lot to preserve down to us the earliest phase of the pantaloon dynasty. So while the rest of the world were booted or heavy shod, his silk-stockinged feet were thrust into pumps of early Oxford cut, and the predominant garment was the surtout, blue in colour, and of the original make before it came to be called a frock-coat. Round his neck was wrapped an ante-Brougham neckerchief which projected in many rolls like a great poultice, and so he took his walks abroad, a figure which he would himself have turned into admirable ridicule.

'One of the mysteries about him was that his clothes, though unlike any other person's, were always old; this characteristic could not even be accounted for by the supposition that he had laid in a sixty years' stock in his youth, for they always appeared a good deal worn. The very umbrella was in keeping; it was of green silk, and the handle was of a big crosier-like formation in cast horn. His face was ruddy, but not with the ruddiness of youth, and he bore on his head a Brutus wig. . . . Except for his linen, which was snowy white, one might suppose that he had been shot and stuffed on his return home from college, and had been sprinkled with the frowsy mouldiness which time imparts to stuffed animals and other things in which a semblance to living nature is vainly attempted to be preserved. So, if he was motionless; but let him speak, and the eternal freshness was still there, an ever-blooming garden of intellectual flowers. His antiquated costume was no longer grotesque—it harmonised with an antiquated courtesy and high-bred gentleness, a manner which he had acquired from the best sources, since he had seen the first company in his day, whether for rank or genius; and conversation and manner were far from exhausting his resources. He had a wonderful pencil, which was potent for the beautiful, the terrible, and the ridiculous, but it took a wayward, wilful course like everything else about him.

'He had a brilliant pen, too, when he chose to

wield it; but the idea that he could exercise any of these his gifts in common display before the world, for any even of the higher motives that make people desire fame and praise, would have sickened him. His faculties were his own as much as his collections, and to be used according to his caprice and pleasure. So fluttered through existence he who, had it been his fate to have his own bread to make, might have been a great man. Alas that in the end some curious annotations are all that remain of his literary powers, and some drawings always artistic! His collection, with its long train of legends and associations, came to what he himself must have counted as dispersal. He left it to his housekeeper, who, like a wise woman, converted it into cash whilst its mysterious reputation was fresh. Huddled in a great auction-room, its several catalogued items lay in humiliating contrast with the decorous order in which they were wont to be arranged. *Sic transit gloria mundi!*'

Among the treasures dispersed at this sale of Sharpe's collection were some wonderful old ivory chessmen of the twelfth or thirteenth century, which were found in the Isle of Skye, and in which the costume of knights and bishops resembled the Bayeux tapestry. These are now in the British Museum. It is much to be deplored that such a collection of Scottish antiquities as that formed by Sharpe was not acquired *en bloc* for the Antiquarian Museum at Edinburgh; the opportunity of obtaining such inestimable *bric-à-brac* will not be likely ever to recur.

The impression which both Sir Walter Scott and Hill Burton give of Sharpe is not on the whole a favourable one. They omit to mention his undoubted kindliness of heart, and the generous help he gave to many in want of encouragement and help. Sharpe must have had some attractive and good points in his nature, for if he had been a mere cynic and scandalmonger he could not have inspired and retained as he did the friendship of some of the most distinguished men and women of his day. His love for his native land, its traditions, its literature, and monuments, was an estimable trait in his character, as was his detestation of all shams and snobbery.

THE RED CROSS.*

A STORY OF THE PLAGUE OF LONDON.

By LADY ROLLESTON.

ON a warm evening towards the end of June, in the year of grace 1665, Captain William Fielding sat alone in the panelled dining-room of Startforth Hall, in the North Riding of Yorkshire, drinking his cup of sack after supper, as became a gentleman of weight and position, and an old soldier withal, who had served with Colonel Coyners Darcey during the past troubles, and was now lieutenant to Sir Philip Musgrave, Governor of Carlisle.

On the table were the remains of a goodly sirloin of beef, garnished with Yorkshire pudding, which, however, had been severely crippled, if not utterly subdued, by an encounter with the captain's healthy appetite; while the curiously carved buffet of black oak at one side of the room displayed a hospitable row of broad-mouthed, round-bodied, jolly-looking flagons and loving-cups of antique silver, suggesting pleasant thoughts to thirsty souls from every boss and curve of their glittering sides, which had been lucky enough to escape the perils incident to such costly toys during the Civil Wars. For, though a staunch Royalist himself, Captain Fielding had possessed in those days a firm friend on the Parliamentary side in the person of Basil, second Earl of Denbigh, whose cousin Susannah he married; and it is recorded that, notwithstanding the fierce strife which then raged between opposite factions in the State, these two friends never once allowed the difference of their opinions to breed discord between them, and continued to entertain a tender affection and esteem for each other, such as honest gentlemen and loyal adversaries, acting according to the light of their consciences, should do—thus setting a gentle example that might well be followed by some rival politicians even in our more enlightened era.

The pale-yellow twilight, stealing softly through the little diamond panes of the deep Elizabethan window, showed the captain to be a tall, handsome, fresh-complexioned man, not yet in his forty-second year, with clear gray eyes, and curling brown hair worn low over his shoulders after the fashion of the time. The extreme simplicity of his dress might have been dubbed Puritan by the frivolous courtiers of the second Charles, who delighted in elaborate costumes of silk and velvet; but the fine brown cloth of which it was composed, sewn at the seams and button-holes with silver thread, the snowy lawn shirt and tie, and the long boots of Cordovan leather, set off the wearer's tall figure to advantage, and sat upon him with a grace which clearly indicated that he was as well acquainted with the Court as with the camp and the country.

Presently a servant entered the room, lighted the candles, drew the curtains, and, having ascertained that his master required nothing more, respectfully bade him 'Good-night,' and retired to the kitchen; while the captain, slowly filling a long clay pipe

* The incidents here related are a well-authenticated tradition.

with Virginian tobacco, proceeded to give himself up to the soothing influence of the fragrant weed with the placidity of a man who has supped well, and is determined to devote that half-hour to repose after meals which doctors tell us is of such benefit to the human system.

Occasionally he glanced somewhat sadly at the empty chairs which should have been occupied by the beloved forms of wife and children; but as he had only come up on leave to attend to some business connected with his Yorkshire estate, he had left the former, with his son, a child of ten years old, at their home in Carlisle; while his daughter Margery, a beautiful young girl of fourteen, was still at a boarding-school in London, where she had been sent to complete her education. It is necessary to mention, however, that the captain's mind was in no way uneasy about his dear ones, for only that morning he had received favourable accounts of his wife and son at Carlisle; and though it was some months since he had heard from his little Margery in London, he had perfect confidence in the care and wisdom of Mistress Tabitha Goodenough, under whose charge she had been placed.

When the clock in the neighbouring church of High Startforth presently pealed out the half-hour after nine, the captain began to feel sleepy, and quietly knocking the ashes out of his second pipe and draining his cup of sack, he lit a candle, and proceeded up the great oak staircase to his bedchamber, where soon afterwards he might have been heard snoring comfortably in the heavy four-post-bedstead which had witnessed the births, marriages, and deaths of the Fieldings of Startforth for nearly a century, since the days when a certain fair Anne Thwaites of Marston Moor, who is mysteriously described in the pedigree as being 'of kin to Madame Bowes'—I believe that there is a Madame Bowes of the present day still extant among the long-pedigreed Yorkshire families—won the heart of another William Fielding, secretary to the British Embassy at Paris (who had just returned from witnessing the horrors of the massacre of the Huguenots), and brought the property into the family as her marriage portion.

Whether the memories of family events clustering thickly under the dark canopy of that great bedstead—which in their time had made the hearts of many of the kindred of the sleeping figure below beat fast with love or sorrow, joy, fear, and ambition, during their brief tenure of life—influenced the slumbers of the captain I do not know. Those hearts have long been laid to rest in the vaults of the old, moss-grown church, and their passionate throbbings are now past like the momentary flutter of a butterfly's wing, leaving the spirit free to waken to that *new* life where 'there shall be no sorrow nor crying, neither shall there be any more pain,' while the story of their earthly hopes and fears is lost for ever, or only faintly echoed down to us in such brief tales as the present.

However, had all the ghosts of departed Fieldings, from Imperial Rudolph of Hapsburg with the long nose downwards, been gathered round the head of their sleeping kinsman, he could not have dreamed a dream of more vital importance to him than the one which disturbed his slumbers that night, and which I will endeavour to describe in his own words, as he told the story to his wife Susy some months later, when they were sitting side by side over their Christmas fire.

'I had gotten comfortably into my first slumber—and thou knowest, Sue, that I have ever been a hard sleeper,' he said, taking her hand—'when methought that I was standing before the house where our darling little Margy lodged, in the parish of St Martin's, Westminster.

'The street was silent and deserted, while the sun blazed down on my head from a copper-coloured sky with blinding heat, and I marvelled not a little to perceive tall blades of grass growing up betwixt the stones of the pavement, as if there had been no traffic in that usually busy quarter; but what struck me with most wonder and consternation was that on the door of Mistress Tabitha Goodenough's house a large red cross had been painted, with the words "Lord, have mercy upon us!" clearly writ above it, while underneath some other hand had scrawled "DEAD" in big characters of white chalk.

'This vision was of such clearness that I had no doubt but that I was really standing in the street; and, being much troubled in my mind to account for these strange things, I awoke with a start just as I was about to lay my hand on the door.

'It was some moments before I could realise that I was at Startforth, lying in my own bed, and I kept rubbing of my eyes, which seemed still to behold the red cross with the word "DEAD" scrawled beneath; but the bell in the church tower pealing eleven presently brought me to my senses, and I was able to judge that I must have been asleep for nearly an hour.

'I now concluded that something I had eaten at supper might have caused me to be visited by a nightmare; so, swallowing a cup of fair spring-water to drive it away, I turned me over and composed myself to sleep again.

'I had not, however, been long in the Land of Nod when the same vision once more arose before me with even greater distinctness, if that were possible, than before.

'There was the scorching sky, the deserted street, and the tall, gable-ended house projecting over me, with the cross and the ominous word "DEAD" on the door, by which I had been so much troubled in my previous dream; and again I awoke suddenly, with a cold feeling of apprehension on my heart, this time to find the moonbeams shining brightly into my chamber, and the ivy tapping gently against the casement in the soft summer wind, as if it were a spirit-hand beckoning me to come forth.

'I confess that I was grievously perplexed; for, though I am no idle believer in dreams, the vision

thus strangely repeated seemed to portend some evil hanging over the house where our beloved Margery dwelt, and it impressed me deeply. However, not wishing to give way to idle fancies, I got up, and, sitting by the open window, smoked a quiet pipe; for, though many of my friends laugh at me for giving way to the practice of smoking, and call it a vice imported from a savage and barbarous people, which is therefore little worthy of imitation among civilised nations, I have often remarked that in times of trouble the aroma of tobacco gives a calm current to the reflections, and clears the brain in a manner that is truly remarkable, many instances of which I could cite, were it not that I want to tell thee about our little Margy, and how by means of my dream she was saved from a terrible death.

'Well, as I sat by the window and looked out on the tranquil moonlit park, and saw the trees gently waving in the breeze, all so quiet and peaceful, my thoughts became more calm, and I began to consider that, as the first dream or nightmare had made such a strong impression on my mind, and I had fallen asleep thinking of it, there was nothing so very marvellous in my dreaming it again; and, having settled this point, I felt more happy, and got to bed again, determined to finish my night's repose quietly. But I had not been long asleep before that same vision appeared for the third time, impressing me with even greater apprehension, and awaking me in a cold sweat of terror.

'I now doubted no longer what to do. Whether the dream meant aught or nought, I was resolved to ride straight to London as fast as horse could carry me, and see with mine own eyes that our little Margery was in no strait requiring help. For I reflected that even were my journey to prove bootless, my mind would thus be set at rest, and I should be doing what thou wouldst have counselled in the anxiety of thy tender heart hadst thou been with me.

'I need not say how anxious I now was to reach my destination, and that it was with but little delay that I dressed myself and roused old Roger from his sleep in the loft over the stable.

'Poor, simple fellow! I could see that he marvelled secretly at my hasty summons; but, being an old soldier, he asked no questions, knowing well that it was his duty to obey; and we soon had Madcap and Primrose, our two best nags, saddled and ready for the road. Then, filling my purse with money, and taking care to place trusty pistols in our holsters for reason of the great insecurity of the highways, we mounted and rode down towards Northallerton just as the first gray streak of dawn was kindling in the eastern sky.

'How we spurred on, past sleeping hamlets and ripening corn-fields, to Doncaster and York, with never a halt or bait save such as was absolutely necessary to keep our steeds in good fettle, I need not tell thee. Our Yorkshire nags—and, I may say without boast, their riders—are used to endurance; and old soldiers like Roger and myself, who have clashed stirrups with Prince Rupert, think little of travelling night and day. But it was a long and arduous ride, the roads being in most sad condition, and thou canst imagine how my impatience was ever outstripping our expedition, great though it was.

'But when at last—on a hot, sultry afternoon, with the sun blazing down through a copper-coloured sky, just such as I had seen in my dream—we approached the outskirts of the great city of London, my heart sank within me, and I almost dreaded to reach our journey's end, lest my worst fears should be realised. This did not, however, prevent our pricking on with all possible speed, though in truth our poor horses went stumbling over the rough stones of the pavement in a sorry enough plight, having traversed forty miles since their last baiting.

'As we made our way between the long rows of houses my spirits grew heavier than ever, for I remarked that the grass was indeed growing in the streets, and that there was scarcely a Christian soul abroad to cheer their desolate aspect, while those few we did meet hurried by on the other side without raising their eyes. This reminded me that the passengers we had encountered on the road as we approached London had all passed us after the same fashion, taking little heed of our salutations, and never stopping to salute us, as is the usual manner of the common people.

'Being little acquainted with the quarter of the town we had entered, I became at last anxious for some one to direct me, and presently espying a stout citizen of the middle-class coming round a corner, I hailed him civilly; but he took no heed, and would have hurried by had I not seized him by the cloak, whereupon the fellow unfastened it from his neck and fairly took to his heels, leaving the garment in my hands.

'I was still pondering on this strange behaviour, when a tall, sallow-visaged man, whom, by his velvet doublet and black cloak, I conceived to be a physician, came along the footway with a red staff in his hand; so, moving my horse in such a manner that he could not conveniently pass, I craved speech of him, but he only answered my salutation by saying hurriedly, "Friend, it is of no use to detain me; there are others who have as much need of me as thou, and I am even now bent on an errand of life or death."

'I replied, with a strange sickness creeping over my heart, that I only wished him to direct me to Mistress Goodenough's house; whereupon, raising his eyes and regarding me earnestly, he said shortly, "If, as I imagine from your speech, you are a stranger, return quickly from whence you came, for God hath visited this city with a terrible pestilence, and it were but tempting Him to tarry." Then, eluding my grasp, he hurried up the street, chewing some pungent herbs that he carried in his hand.

'Oh dearest heart! thou canst imagine what my feelings were after this. Although hardly daring to put the thought in words, I had felt some misgiving before as to what his answer might be, but now I knew of a certainty that we were in the presence of that pestilence which walketh in darkness and striketh in the noonday, sparing neither young nor old, and that my dream had come true.

'We hurried on our way, a great terror keeping us silent, till at last we stood before the house we sought; and there, just as I had seen it in my vision days before, and I now knew that I should see it again, was the doorway with "Lord, have mercy upon us!" the great red cross, and the word "DEAD" carelessly scrawled upon it, staring us in the face.

'It was but the work of a moment to spring from my horse and to run to lift the latch; but a heavy iron padlock had been fixed to the gate, and prevented my entrance; while no living voice responded to my repeated knocks and cries.

'While I stood irresolute how to act we heard a lamentable wailing, and a poor, half-naked creature, with staring eyes and dishevelled hair, ran towards us, wringing his hands in a most terrible manner, and crying at the top of his voice, "Lord, have mercy upon us! What shall we do—what shall we do?" But, on perceiving that we would fain accost him, he uttered a loud shriek and darted down a side-street, where he was soon lost to view. So, with a heavy heart, I turned me to the door again, and recommenced knocking.

'At last a fellow, carrying a halberd in his hand, whom I took to be a guard of some sort, approached, and, stopping at a good distance from us, shouted to know what we wanted. I replied that I would enter the house where my daughter lodged, adding that he should have a gold piece if he would aid me to get in.

'He bade me throw the money on the ground, and then, placing it in his pouch with a grin, said, "I am sorry, my master, I cannot do your bidding; but it is more than my place is worth. The searchers visited that house this morning, and declared all in it dead of the pestilence. No one may enter now till the dead-cart comes to carry away the bodies; and I am the watchman set to keep the door."

'"But I will give thee yet another gold piece," I cried in my despair, "if thou wilt let me go in for but one moment to see if my child is there."

'"I cannot do it," he answered sulkily; "it is against the Magistrate's orders."

'"Then, by the sword of Prince Rupert! I will go in whether thou wilt or no," I exclaimed, drawing a pistol from my holster and holding it to the lock.

'On seeing me thus determined, he called to me to stop, saying that he had the key; but added that if I once went in I should have to remain, as none might leave a plague-stricken house till they had been fourteen days without taking the disease.

'I told him I cared not for that, and, bidding Roger lead the horses to the nearest hostel and there await my coming, prepared to enter. The faithful fellow, however, instead of doing my bidding, sprang from his horse, and, plucking me by the cloak, besought me with tears in his eyes not to turn him back; and indeed was so earnest about it that at last I was constrained to let him have his way. So, the watchman having promised to see to our horses, we passed together through the dark doorway, which was immediately locked and bolted on the outside.

'I will not pain thee, sweetheart, with a narrative of the sights which met us in each chamber of that terrible house, where the lives of so many poor creatures had suddenly been cut off in the night, as the sword of the Angel of Death swept through it. I will rather hurry to that little room on the second floor, where all my fears centred, and in which I found our Margery lying cold and motionless on her snowy bed, her young face rivalling the damask in its whiteness, but, I thanked God, not changed in the dreadful manner that had made the other rooms so terrible to enter.

'I sat down, and, taking our darling's hand in mine, for some time remained overcome by emotions which *thou* canst picture, though I cannot even now bear to describe them. Was it something in the touch of that soft hand, or a sudden inspiration from above, that made me bend eagerly over our child and hold a mirror to her parted lips? The smooth surface for a time remained bright and polished, but at last—surely it was not the thankful tears rising in my eyes?—I thought I detected a slight haze upon it. Quick as thought I drew my sword and gently pricked the slender wrist; the blood flowed fresh and red, and then I fell on my knees, and, burying my face in my hands, thanked God for His great mercy.

'Yes, though sorely stricken with the plague, our darling still breathed; the ignorant women-searchers who had visited the house having left her for dead among the dead, with not a living soul near her, to be buried alive in the great pit when the dead-cart came round!

'During two long hours I sat by the little bed without moving, for I knew that even there before my eyes the silent struggle between youth and the Destroyer was being fiercely fought over that passive form, and that when she awoke it would be either to this life or the next.

'The shadows of evening lengthened, and darkness closed on the deserted street, yet still I sat, holding the passive hand in mine, as the anxious moments sped. Then, suddenly, the ringing of a bell pierced the silence, accompanied by the heavy rolling of wheels; the glare of a torch flickered up through the window, and a hoarse voice shouted beneath in grating accents the fearful summons, "Bring out your dead."

'Presently the lock of the front door was unfastened, and heavy footsteps entered the lower rooms. The dead-cart had arrived!

'Soon Roger, who was standing sentry in the passage, beckoned with his hand, and, closing the door softly behind me, I joined him; for the men, who had emptied the lower rooms, were now coming up the stairs.

'"We seek another body," said the foremost fellow on beholding us; "the return gives seven dead in this house, and we have taken but six."

'"You have taken all that are dead here," I answered. "Go your way in peace."

'"I have my orders to execute," replied the man with an oath. "Stand back, or it will be the worse for you!"

'"The worse for you," I said quietly, drawing my sword and barring his passage. I heard afterwards that these buriers of the dead were some among the most hardened creatures of the town by reason of their dreadful calling; and I can well believe it from the torrent of abuse the men showered upon us; but at last they were fain to retire, and, fastening the outer gate behind them, left us alone in the plague-stricken house.

'As I turned again to the sick-chamber and resumed my watch, I reflected with horror and a feeling of deep thankfulness to God on what might have been the fate of our poor, helpless darling had I not been there to save her from those ignorant ruffians, who would assuredly have cast her tender body into one of the great pits, where in times of pestilence the dead are buried in nameless heaps and speedily consumed with quicklime.

'It was, I think, towards three in the morning that I noticed a quivering of Margy's eyelids, and presently, to my unspeakable joy, she opened them wide, and fixed her gentle gaze full on mine. The poor child seemed very weak, and suffering from a great oppression on the chest, but she managed to whisper the words "Dear father," though in such halting and pitiful accents that I could hardly catch what she said; then, closing her eyes again, she lost consciousness for a few moments.

'I ran to the window to let in more air, and, seeing the watchman standing below, besought him to fetch a physician, which the fellow, who was not ill-natured, presently did, bringing with him an honest apothecary, named Boghurst, from St Giles's-in-the-Fields, who, having felt his patient's pulse, pronounced her to have passed a most dangerous crisis of the disease, and held out good hopes of her recovery. Then, prescribing a decoction of dill, pennyroyal, fennel, and aniseed in a posset-drink, he departed, promising to return in a few hours.

'The watchman would on no account permit Roger or myself to leave the house, but willingly executed all our commissions for us, bringing whatsoever we required, and placing it in a basket, which we lowered from one of the windows and drew up again with a cord.

'For the first few days I felt the want of exercise very much; but as Margy slowly grew in strength I spent many hours by her bedside, reading to her out of some works of fiction that I had found in some of the lower rooms; and at this time learned how great a boon those who write such books can confer on the suffering in mind or in body, by leading their thoughts away from themselves, and attracting their sympathy to creatures who, though fictitious, are yet sufficiently interesting to arouse the nobler feelings of the heart.

'Doctor Boghurst often called, and I soon discovered that he was not only a clever and brave man, as assuredly he was, attending the suffering in all the most infected places; but one, too, possessing great natural kindness of disposition. He was also a merry companion, fond of his cup of sack, which he declared to be a great specific against the plague. Some people, he said, mixed it with wormwood; and Roger, having taken to this idea, often caused me to laugh, even during that sad time, by the long faces he would pull over his potations. For myself, I took a moderate amount of sack pure, but both Roger and I smoked tobacco continually, and to this I mainly attribute our escape from the infection.

'It was curious to hear Dr Boghurst relate how strangely the disease took some and left others, many of the most reckless and abandoned being spared, while those who were good and well beloved were called away. But this I take to be but another proof of the great mercy of God, who would not cut off His poor, erring creatures before they had time for repentance; and often have I heard stories of deeds of wonderful kindness and devotion performed during these days of trial by some who before had seemed most frivolous and thoughtless.

'At length the strange halting in Margy's speech happily passed away, and she was pronounced strong enough to travel. But now a great difficulty presented itself, for the common people in the country round London had such a terror of infection that they would suffer none coming from the city to lodge in their houses, and were even unwilling to permit them to pass through their villages. But at last, the watchman having procured at a great price the hire of a spacious coach and four stout horses, we decided to set forth and take our chance. I rewarded the fellow well for his diligence, and one dark night, when all in the street were abed, he unfastened the bolts of the door, and we stepped once again into the open air.

'Roger and I rode beside the coach, while Margy sat inside with a good woman we had procured as her companion. But I will not now tell thee all the difficulties we encountered on the road, lest I make my story too long. It is enough that I have brought thee our child safe and sound, and that her dear life was preserved through that strange dream which, coming three nights before the event, enabled me to save her from being buried alive.'

A DORSETSHIRE INDUSTRY.

THE MANUFACTURE OF TILES.

ONE marked feature of the spread of sanitary science is the increased use of tiles for building purposes. Instead of having walls with papered surfaces which need frequent renewals, and boarded floors with cracks and crevices which harbour dust and prove resting-places for disease-germs, the rough insanitary surfaces are being gradually replaced by the smooth surfaces of tiles, which, while resisting dirt and dust for a long time, are capable of being easily and quickly washed without being marred by the process, and thus they may be considered practically everlasting in wear.

Not only are tiles thus useful from a sanitary point of view, but the smooth, hard surface lends itself to artistic treatment, and tiles are used in buildings for their decorative as well as for their utilitarian qualities. The use of tiles for decorative purposes was known ages ago among Eastern nations; and although the use of such tiles was probably introduced into this country at the time of the Crusades, they were reserved chiefly for the decoration of churches on account of the expensiveness of the imported tiles. It is only of recent years that tile-making has become a home industry; but during those few years it has steadily prospered, and at the present time it gives promise of still further development.

Some of the potteries of Staffordshire include the making of tiles, the clay used being imported from Dorsetshire; but Dorsetshire is beginning to use its own clay, and as coal can be sea-borne at little expense to Poole, that town, with its suburb of Hanworthy, is established as the headquarters of the Dorsetshire pottery industry.

Most of the clay used at Poole is obtained from the neighbourhood of Wareham, and is of a gray or light-brown colour; but the cream and white clays which are used for the best and most highly ornamented tiles are imported from Cornwall and Devon.

It takes four weeks to turn the shapeless mass of rough clay into the finished tiles ready for the market, for the sticky clay has to go through many processes, which must be done slowly in order to be done well. From a shed in the yard outside the pottery, the clay is carried indoors and put into a powerful mill, which crushes the stones found in the clay into smaller fragments. Another mill pulverises the clay more completely, and then it is dried so that it may be more easily crushed, and better mixed in the next process, which consists of two more grinding operations. The clay, which by this time is reduced to a fine powder, is put into a revolving sieve, which resembles the sieve of a flour-mill, and keeps back all but the finest powder. The white clay, which has to be of extreme fineness, is put into a machine containing three sieves, which are arranged one over the other, and which act simultaneously, so that by the time it has passed through the three sieves the particles are of a microscopic character. It is then mixed to a thin paste with water, and pumped into a press containing calico bags, which are subjected to great pressure, so that a clayey mass remains in each bag. The bags are drained, and the clay is scraped off and placed in a steam-heated cupboard until it is sufficiently dry to be further pulverised and milled.

The dust is stored in bins according to colour, and when it is required for use it is slightly damped—so slightly that it still appears as powder—just sufficiently to enable the particles to cohere when they are pressed together. The damp dust is placed in a mould, a few turns are given to the screw of a press, and, lo! there is a shaped tile which is strong enough to bear gentle handling. Each press is worked by a man, and a boy stands near to receive the tiles, trim off any rough particles, and stack them ready for the drying-room. Some of the presses turn out small cubes which are used in mosaic-work, and which show a full range of colours, some of which are natural, but others are owing to an admixture of colouring matter to the clay. The most interesting branch of tile moulding is the making of encaustic tiles, in which the pattern is wrought in different coloured clays. The mould is filled with clay-dust of a particular colour, and over it is placed a sheet of thick brass from which a pattern has been cut out, a little more dust is added to fill the spaces, and the mould is pressed. The pattern is then removed, the spaces filled with dust of another colour, pressure is again applied, and the result is a tile decorated in a style capable of resisting the wear of years. Some tiles are composed of clay-dust which has been mixed to a stiff paste with water. Such tiles are moulded by hand, and when coated with a particular glaze are frost-proof, and are thus useful for decorating the outside of houses.

The moulds are carried to the drying-room, which is heated by steam-pipes. Here they remain for three or four weeks, so that they are hard enough to resist the greater heat of the furnaces without buckling out of shape. When ready for the furnaces, the tiles are stacked in lidless boxes of rough fireproof ware which are called saggers, and which are made from the débris of the clay. The saggers are piled up in a kiln capable of holding so many tiles that it takes three days to fill the kiln. The entrance to the kiln is then blocked with brickwork, and a fire is lighted underneath. The fire requires great skill in management, and the stoker

is by no means the least important person in the pottery. A complicated system of flues arranges the distribution of heat, and the dome-shaped chimney, which marks out potteries from other factories, reflects the heat downwards into the kiln. The fire is kept burning night and day for seven days, and then the tiles are tested. If they are properly baked, the fire is permitted to go out and the kiln is allowed to cool very gradually, so that a sudden change of temperature may not cause cracking among the tiles. When quite cold, the saggers are lifted out and the tiles are tested. Those that ring true are set aside for the finishing processes, while the faulty goods are crushed to atoms and are added to the crude clay, to pass again through the various operations from the beginning.

Interesting as is every process in the manufacture of tiles, the most interesting part is the decoration of them. It seems as though there is no limit to the various ways in which they may be ornamented, varying as they do from the plain glazed coloured surface to the hand-painted picture which perhaps is only part of an elaborate piece made up by a combination of tiles. The exact composition of glazes is a well-guarded trade secret, and experiments are constantly being tried for obtaining new effects. Some glazes give a transparent coating only, others give a glazed body-surface of various tints which depend largely upon the firing for their final effects, others give a dull effect in artistic shades and are known as 'monastic' glazes, while others reproduce the metallic surface of the old-fashioned lustre-ware.

Many tiles are moulded with a patterned surface, and both men and women take part in decorating such tiles, using glazes of certain colours for the groundwork and others of contrasting colours for the pattern.

Another simple form of decoration is known as 'slip outline.' A design is pencilled on the surface of a plain tile. The outline is then covered over with a glaze which is squeezed from a rubber ball held in the palm of the right hand, through a glass tube drawn to a point at one end like a stylograph filler. When the design has hardened sufficiently to prevent the colours from running into one another, the groundwork and the design are covered with different coloured glazes.

The most expensive tiles are those which are hand-painted with colours which are specially suited to the decoration of pottery. This branch of the work gives scope to the designer, who, when he knows the kind of building which is to be decorated with tiles, prepares designs of ornamental arrangements of tiles specially suited for its particular purpose. Some of the designs include a large picture which is made up of separate tiles in the same way as children's pictures are sometimes made up of blocks. The plain white tiles are arranged close together and regarded as a single surface while the design is being painted on them, and when they are numbered at the back they are easily pieced together again after they have been glazed and fired.

The appearance of a tile when it is newly glazed gives no idea of what its appearance will be like after it has been fired. The surface looks as though it had been painted over with a muddy composition of dull and neutral colours, yet when the tiles have passed the second time through the furnace the full beauty of the colours is brought out, and the surface has that glazed hardness which makes tiles so sanitarily clean. For the second baking, the tiles are again placed in saggers; but, as they are wet with their coating of glaze, they have to be kept apart by little racks and pegs of earthenware, which is, of all common substances, the only one which is able to withstand the intense heat of the furnace.

A modification of tile-work which is carried on in the same pottery is known as faïence-work. This consists of large blocks of mouldings or elaborate designs, and it plays an important part in modern buildings as a substitute for stone on account of its great durability. The powdered clay is moistened into a stiff paste which is either moulded by hand or shaped in earthenware moulds, and then baked. Some beautiful work of this kind is sometimes produced. The design, which may be an elaborate one of fruit and flowers, is modelled in clay, and a cast is taken which serves as a mould for the plastic faïence-clay. Like tiles, the blocks are baked, and sometimes too, like tiles, they are glazed. Glazed faïence is used very largely as curbs for tiled hearths, and often, too, whole mantelpieces and overmantels are composed of it.

Smart shops often have the doorway paved with mosaics arranged in artistic designs, and often with the name stretched across the white surface in mosaic lettering. Mention has already been made of the moulding of mosaics, and when they have been hardened in the furnace they are ready for use. Women are generally employed in the laying of mosaics, which is interesting work in spite of the kneeling position which has to be adopted in carrying it on. A large sheet of brown paper with the design traced on it is spread on a large low platform, on which the women kneel. The paper is glued a small piece at a time, and the glued surface has the mosaics closely packed upon it in accordance with a small coloured design which the worker has at hand. If the cubes do not fit, they are placed on a block of lead, and a smart blow from a hammer on a chisel-like tool soon chips off as much as is necessary. When the whole surface of the paper is covered with mosaics it is ready to be fixed. The doorway is spread with moist concrete and the mosaics are set in it, and left until the concrete has hardened. The brown paper on which they were glued and which forms the upper surface is soaked in warm water and peeled off, and then is revealed the name and design in their proper sequence and not reversed as they appeared while they were being pieced together.

THE HEART OF THINGS.

By Henry Leach.

London, *Yesterday.*

ALREADY there are murmurings of fear as to what may happen on the next Budget night, for it seems the Exchequer has got itself into a tight corner, and that for its freedom some drastic measures in future taxation may be necessary. Those old-age pensions, which have proved so much more expensive than was originally estimated, have to be paid for in some way. So, when men collect together, they begin now, as many times before, to speak of ways and means. Some new methods of taxation are perhaps essential. New ideas are wanted. Some persons have spoken with hope of a scheme of taxing professional sport, like Association football, as was suggested in these pages a little while back. Others are asking themselves whether we are to take it that no further burden is to be placed on the motorists. Are bachelors, cats, newspapers, advertisements, or other things that have been mentioned in this connection before, to be taxed now or never? Or instead of gaining the money that we need by fresh taxation, should we not rather try to save it out of current expenditure? This is the easier way, and that which makes for less discontent in the aggregate; though, to be sure, there are some who would grumble vehemently and for a long time if all schemes of retrenchment that have been suggested by wise men were put into practice. But when the business man finds that his accounts for a year are not so satisfactory as they ought to be, one of the things he invariably does first of all is to look through his office and his works or establishment and cut down waste, merely useless and often inexplicable expenditure. The mention of those pensions which are the cause of some of the Chancellor's present difficulties recalls that until lately we were reckless spendthrifts in pensions given to those who had done nothing towards earning them, and it is only a little to our credit that a few years ago, thanks to the report of a Select Committee, an end was put almost entirely, and chiefly by commutation, to heavy pensions which had been going on for many generations—why nobody knew. When we commence public works in these days we hear much of the rights and privileges of posterity. If anything, we are too indulgent with posterity. If we pay a sovereign we see to it that posterity shall not pay more for the same thing; we are rather disposed to let it have the article, whatever it is, for nineteen and six, and a full further allowance for any depreciation. Posterity may be grateful to us of the early twentieth-century period—that is, provided it has a taste for the things that we enjoy and are placing upon the earth. This is a fine tribute to our judicial fairness under severe provocation, for inferior nations might have been disposed to 'take it out' of their posterity for the burdens which had been inflicted upon them by ancestors who seemingly cared not a snap of the fingers for their own posterity. Our ancestors of a couple of hundred years behind, or less, were a fine body of men, who had little meanness in their spirit, and liked doing everything well. Heroes then were treated like heroes; those who were of service to the State were splendidly rewarded. There were exceptions; but this generally was the rule. When they wished to do anything of this kind unusually well, to show that they had a fine prodigality in good causes, they had a method which cost them, indeed, but little, and yielded not much to the benefactor, but which in name and provisions seemed to measure out to the last degree of munificence and generosity. We, the posterity, paid, and did so at a time when all the advantage, or most of it, that had originally been derived by the country—if any was ever derived, as it was not always—had disappeared or been forgotten. The method was simply this: to give a pension for life to the deserving person, and, more than that, to give it to his heirs and assigns *for ever*. The heirs and assigns had nothing to do with the service or circumstance, and might be comparatively worthless or unimportant persons, and we, the posterity,

[*All Rights Reserved.*]

who it was decreed should pay them, might be getting no benefit from the original situation. But it made no difference. Our ancestors with light hearts wrote 'for ever' on those parchments, and posterity kept on paying, and looked like doing so continuously until that Select Committee thought very hard and recommended us to pay off the heirs and assigns by commutation, or a lump sum, even though in many cases such commutation ran to hundreds of thousands of pounds. And this was done, so that now there are only one or two of those pensions still left, and we do not mind them when they are ticketed with names like 'Nelson.'

* * *

In these days we are not so prodigal with pensions as our forefathers were; but the fact remains that we are still a great people for giving them, and at times of financial stress like this it might be wise to consider whether these pensions might not, with serious disadvantage to nobody, be reduced in number and in value. No names are to be mentioned in this connection, nor is a grievance felt against any particular class in the pensions that they receive. Thus we are not associated with the fears of some who recognise that the present Government may complete four years of office before it goes out, and that in that case Cabinet Ministers of the first rank become entitled to pensions of two thousand pounds a year. These are very infrequently asked for, as Ministers in past sessions have for the most part been wealthy men; but the case is different now. Ministers of the second rank get pensions of one thousand two hundred pounds when they have done six years' work, and unthinking people have been known to express satisfaction that their qualification, as events are shaping themselves, will not be complete. It has often been pointed out that a certain great dignitary of State gets a pension of ten thousand pounds a year when his party goes out of office, just because he doubles certain offices, one of which at least makes hardly any demand upon his time or abilities. This is a big pension, and it is none the less by contrast with the case of the President of the United States, who gets nothing when he goes out of office, and must buckle into his work again like any one else. But the Government departments are the places where pensions are thickest. Once get into one of these departments, and it is virtually impossible to avoid a good pension, one which conscientious pensionaries feel too often is better than their poor abilities have merited. People are paid salaries for doing nothing, filling appointments which have long since become obsolete, and then, after fifteen years of boredom by regulated idleness, they take their pensions and go away. The easiest way to make money out of the State in a civil office is not to study for examinations, cram and pass them, and then 'work up' to be a something of the first division; but to make an intelligent study beforehand of the odder pensions that are given, and to qualify for one of them. Or the Governments of either complexion are always willing to create new appointments with pensions attached to their tails when interesting suggestions are made. Only the other day we had authentic information of a suggestion to this effect having been most favourably entertained, to the end that the gentleman concerned was duly appointed in a new place, with the special advantage of his appointment being antedated a few years so that he would have less than the ordinary fifteen to toil through. Wander through the dark alleys of departments, and you will find men huddled away in corners, dozing through these ugly years until the bright morning dawns when they need no longer go to do nothing at Whitehall, but with a pension and a new spirit may go forward to engage in enterprise in which their activity may have its fling.

* * *

But perhaps when we get on this administrative trail we may find that great economies may be effected without taking anything from the pockets of individuals and officials. Royal Commissions and Blue Books might be made much cheaper than they are. A little while since a Select Committee which had been appointed to consider the form and cost of the House of Commons publications made several useful recommendations; but later still we have been apprised of some interesting circumstances appertaining to the *Fifth Report of the Royal Commission on Sewage Disposal*. In 1898 ten persons were appointed to sit on this Commission, of whom only three survived to sign the fifth and semi-final report. It appeared that the only result of the ten years' work was the output of about forty pounds of Blue Books, running to five thousand two hundred and ninety-three pages, at a cost, for the entire editions, of fifty thousand pounds. This works out to about nine pounds a page, which, from the literary point of view, is shamefully extravagant, and it can only be considered from this point, since experts have said that the information contained has little practical value or else will not be applied to advantage. There are, however, worse cases than this. A little while back a volume of a Traffic Commission's report was issued and achieved some notoriety. This report cost two pounds and ninepence a copy, and one thousand two hundred copies were printed of it, of which three hundred and twenty-eight were sold. When such things happen we are prepared for the further information that in 1904–5 the considerable sum of four hundred and fifty-six thousand eight hundred and fifty-two pounds was paid for the nation's printing, and that one of the results was that two thousand nine hundred and sixty-three tons of waste-paper had afterwards to be sold. One of the pretty ways of the people who are responsible for these things is to reprint papers, that are first printed in the octavo size, in

foolscap, so that they may be bound and placed on the library shelves. This is merely a matter of looks, of æsthetic fancy; but it costs one thousand two hundred pounds a year. If we must give old-age pensions, and have difficulty in paying for them, it would be a good thing surely to take a walk through these various departments and see where we may remove a little unnecessary expenditure. The instances quoted here are merely taken hap-hazard from the general stock. This is essentially an age for national economy.

* * *

It may be presumed that when Ovid submitted that '*Nulli non sua forma placet*,' he did not mean that ladies were satisfied with their own personal appearance at all times and under every condition; but rather that when they decked themselves, and with excusable arts made it that they 'looked their best,' they were invariably pleased, seeing perhaps beauty where others of weak and careless discernment noticed only comeliness, and rejoicing in comeliness when detractors in mean whispers would speak of homely looks, and thought they were being generous at that. The poet must certainly have intended this qualification, because we can imagine circumstances in which the charms of Venus would have brightened the eyes of no young male person, and in the same way we conceive that in reflective moments it would be a grief to a lady could she see herself as others saw her at some time in full view of a vast audience, being carried in men's arms from a platform with her clothing all awry, hair loose and dishevelled, face red with anger not suppressed, and lips uttering mere incoherences. Surely ladies in such circumstances could not be satisfied with their personal appearance, and so they must be making great sacrifices. So, too, their fellows who at similar times chain themselves to chairs and fixed railings, and in such security scream hysterically across wide halls filled with people or in chambers where grave matters are being debated. By such thoughts as these we come surely to realise the vast sacrifices that some of the women of the day are making in a cause which they represent as being of the utmost moment to their welfare and that of their sex generally—of such moment, indeed, that not merely will they sacrifice their appearance, but for the furtherance of their affair, as they think, they impede the work of Governments, turn the streets to pandemoniums, and even make schisms and unhappiness in homes that aforetime knew nothing that was not of joy. The extent of the nuisance of the woman's suffrage movement, as it is being conducted at the present time, is probably not fully appreciated in country places. It is in the Metropolis that the aggravation to men and to reasonable women is greatly felt, and many of these men could in these days preach with effect and sincerity from a text yielded to them by wise Solomon, who held that 'it is better to dwell in a corner of the housetop, than with a brawling woman in a wide house.' Now, let us not be misunderstood in this matter of the suffragette movement. In these pages there is never any inclination to discuss contentious matters, but rather to avoid them, not seeking after the manner of partisan publications to influence the opinion of readers; and, furthermore, it must be said that in some of its phases the woman's suffrage question is not a contentious matter, since the great majority of thinking men are entirely agreed that in some certain circumstances, as when a masculine responsibility is borne, women should have the vote which is given almost universally to men. But, however unfair it may be to judge all women by and condemn them for the methods of the militant minority, it is almost inevitable in the circumstances; and so the persons who would give votes to women are brought to a second thought in the matter which they think is better than the first one. They ask themselves whether women who shout in squares and sing outside prison walls are quite the kind of people to be entrusted with votes, and reluctantly they answer 'No,' because in these women they see at times all the weaknesses of the sex magnified to the extreme degree, and they search with difficulty for those qualities and charms which they have been wont to honour and admire.

* * *

These ladies are a curious product of an age of difficulty and strain which tests the mental balance of all human beings as no other has ever done, and strongly tends to excite unduly fine and feminine temperaments. They are inclined to forget themselves, their sex, their dignity, in a mad pursuit of what in their excited imaginations they regard as 'politics,' and it is these politics which have now become 'their whole existence' in place of a gentler and fully feminine passion. In their present state of mind, the methods they adopt suit them most admirably. They are given a notoriety, a public exhibition in the limelight, which they could not possibly gain in any other way, for more than a day at any rate—a notoriety and a publicity which, let it be said, the best women, those whom the men of England have most respected, have generally shrunk from. See how, in the whirl of their political adventures, they check themselves marvellously to pose calmly and steadily to the photographer, once before they go forward to the battle, and again when, battered and beaten, they emerge from it; affording also facilities to the photographer to obtain a few pictures of them in the act of destroying the public peace. Then, best of all, in the evening papers and in those of the morning that follows they see exhaustive accounts of all their doings and adventures, verbatim reports of their speeches, in which they speak of their cause and all the rest of it, headlines in large type surmounting the columns; and they have the further satisfaction of reading leading articles on their policy and methods, some, be it said, exhibit-

ing no uncertain vein of sympathy with them. They feel that they are stateswomen, that they are leading England, and so forth! Men who read and witness feel sad. Agreeing with the principle of women's suffrage to a certain extent, as already explained, they realise sharply the danger of granting it as they could not have realised it in any other way. They feel that for the present there can be no franchise, particularly when the militants' 'no compromise' policy and their insatiable appetite for publicity makes it seem that nothing short of a complete franchise would stop their raging—nothing but one thing. People who are tired of this foolish nonsense ask themselves and others how it may be stopped, and they find no answer that is completely satisfactory. If the terms of imprisonment were increased, if ringleaders were banished, if even more drastic punishments were administered such as have been visited upon the leaders of political movements which have been regarded as impediments to the State in the past, it is more than doubtful whether they would be effectual. Where there is so much excitement, so much of the hysterical, and such a love for the limelight, there is no reason and no desire to terminate the period of quasi-martyrdom. But there is just one simple little thing that can be done, and which would kill the suffragette movement, as we know it at present, in a single week. No great publicity can be obtained without the Press in these days; the publicity that is obtained in other ways is not quick enough or sufficiently general. For the present it suits the papers to report these proceedings at great length. When they are tired of that, and when they come to the conclusion that in the general interest it will be quite a good thing to cease to take any further notice of the militant women or to print any more pictures of them in the throes of being militant, and act accordingly, the movement will be dead from that time. It feeds itself to life and action only on a diet of excitement and notoriety, and its little feminine pulse will cease to beat when this sustenance is withdrawn.

* * *

In the meantime, perhaps, the most serious effect of what is going on is not the nuisance in the streets, the impediments to certain forms of public business, the general rowdyism or the damage done to property, as the strain that is being put upon the chivalrous respect of men for women. These women claim to be treated like men; but during their hysterics great allowances are made for them by men sorely provoked who will not take them at their word; and yet, when the fighting, screaming, and kicking are over, the militants complain of their treatment, and speak of themselves as if they had not surely forfeited some of their rights. Man in his most perfect state should be impervious to any influences that might tend to lessen the spirit of chivalry towards women; but at his best now he is just below that perfect state, so that in the rarest cases of violent aggravation he feels that his gallantry cannot endure much longer, that but a little more and he must force upon his womankind an almost Eastern state of complete, silent, and uncomplaining subserviency, if nothing more. No doubt this feeling is unjust, because the militants who create it are but a small minority among womankind, and the great majority are yet true to those fine principles which have won for the sex the deep reverence of men, and made Englishmen the world over yield to the men of no other nation in their pride of their women. Yet some see a potential suffragette in each woman; and when, in addition, they contemplate the troubles that have been made in what were once the most peaceful homes by this business, the more acute does feeling become in the matter. Thus some men who ponder on these things are led again to ask themselves whether the women of the time, or those of whom we hear most—who are, be it said, not the best representatives of their sex—are quite of the same value as those who have built up the system of the English home as it is. Women, with the honour and the freedom which they have enjoyed in this country, have risen nobly to their opportunities and played no small part in the achievement of the blessings which have been enjoyed by all classes. So they have been set forth proudly as a pattern to the women of all other lands. But now some people begin to ask whether our English women are still so much superior to others as we have imagined, or as they were in the past. It is beyond doubt that the American woman, with her splendid sense and dignity, and her practical yet refined mind, is an enormous force for good, happiness, and success in the American life of to-day. Then some people, whose knowledge of France is limited to a few visits to Paris and odd walks along the boulevards and through the Place de la Concorde, imagine that the type of the French woman is the frisky little creature who skips nimbly across the streets making a show of lace about her ankles, and being in fact 'the gay Parisienne,' who is delightful in her way, but of little real value either to empires or homes. Others who know the heart of France are aware that the French woman is the backbone of the nation, and a strong backbone, too. She is wise, prudent, and thrifty to the utmost degree; she is constantly zealous in the interests of her kinsfolk; and she bears a great burden for the love of bearing it, and quietly, uncomplainingly, rejoicing with a full heart in a reward of the appreciation—slow enough sometimes, but always there—of the husband who toils for her. Some people sneer at the mention of home-life in France; but there is still much that is good that we might learn from it. Now, in France the women do not want the suffrage; nay, there we have the spectacle of the Government thrusting votes of one kind and another upon the female population, and of such voting-powers not being exercised to any appreciable extent. Thus, a little

while since the women in business were given votes for the election of the tribunal of commerce, which decides all trade disputes. Yet, though there are a thousand or more who are qualified, only eight have so far taken the trouble to have their names placed upon the register. Then, more recently, it was determined that all women employed in business, as well as men, should have votes for the election of the 'Conseils de Prud'hommes,' being special commercial courts. When the ballots closed at the end of last October it was shown that only twenty-four out of every thousand women had availed themselves of their privileges in the matter, and even this small minority consisted entirely of female clerks employed in certain large banks, whose names had invariably been placed on the registers by their employers. In not a single case had any woman taken steps to get her name placed on the registers. This is not mere listlessness or apathy of any blameworthy kind, as some of the 'advanced' women of other countries might suggest. It is merely that such active citizenship—this voting, electing, council-making, resolving, and all the rest of it—is work that is alien to the mind and disposition of the French woman of to-day as to all her predecessors, and that she still conceives that her place is to do the best she can for her family, and to make the least possible disturbance or assertion of rights and privileges in doing it. But, as a last word, it is a good thing to think and know that the qualities of the English women generally are as high to-day as ever. The suffragettes are a tiny minority, but an aggravating and perhaps a dangerous one.

* * *

Concerning this matter many efforts were made lately to discover parallels, even if weak ones, in the past records to the recent trouble given by the ladies in the Gallery of the House of Commons, and some most interesting results were adduced. But we do not remember that one anecdote, which is surely the best of its kind, was adduced. Once upon a time, during the reign of Mr Speaker Denison, the Deceased Wife's Sister Bill was having one of its turns in the House, when, on a motion by Mr Hanley, orders were given to have the Ladies' Gallery cleared. One lady refused to leave. The order was repeated; but the only effect the repetition had upon the lady was to make her threaten that if any one touched her she would scream! The Speaker thereupon beckoned Sir John Hay to the chair, and said to him, 'Tell Hanley I've twice sent the Serjeant-at-Arms up to clear the Gallery. He reports all gone but one, and she won't budge. I believe her to be the deceased wife's sister! We had better take no notice, and go on with the debate.'

NATURE AT NIGHT.

By F. G. Aflalo.

THE 'sabbath of mankind is the working day of more creatures than spend it in repose. It is one common error to associate light and life, and another to regard the dark hours as the sleeping-time of most of Nature's children. There are reasons for these fallacies. In the first place, we ourselves devote most of the night to rest. Then, also, most of the birds roost through the darkness, waking only in the blush of a new dawn. Birds, like the grasshoppers of which Burke complained, are so noisy that they engage our attention to the exclusion of the more silent beasts and reptiles, so that when they are at rest we are apt to deem all nature wrapped in sleep.

Yet the thousand eyes of Night, from the brief darkness of the tropics to the all but eternal gloom of the poles, look down on a busy world. In hot countries particularly the earth seems lifeless all the livelong day. A few gorgeous birds may flutter in the tree-tops; a bloated vulture may rise heavily from its orgy in the plains; a lizard or two may flash from your horse's path; but for the most part animal nature hates the fierce caress of a tropical sun, and shrinks under cover till its strength is spent. Then, when it has gone to light another hemisphere, when Night has flung her black cloak over the parched landscape, myriads of creatures start from fissures in the earth, from holes in trees, from caves and water-holes, as if by magic, till, where an hour earlier all was lifeless, you cannot stir without sending some unseen creature scuttling out of danger. I remember well a sweet orchard of nut-trees four or five thousand feet up in the Atlas Mountains, in which we pitched our tents at sundown. During the brief gloaming I wandered round my kingdom of a night in the vain search for some interesting butterfly or lizard, and found nothing but a colony of ants, which, as they were at the end remote from my sleeping-quarters, I took some pains not to disturb. No sooner, however, had the African darkness fallen on peak and valley than the little plantation seemed alive. Owls hooted and unknown birds chattered, reptiles made the fallen leaves crackle in the darkness, and little marmots came out from the boulders that towered beside our tents as soon as the moon lit up the gorge.

Every creature of prey, from lions to scorpions, fares forth at night; centipedes, cockroaches, and spiders swell the company. The mosquito, which all day has left the European in peace, once again raises her accursed voice in praise, and comes gaily to the feast. The darkness lures the weak as well as the strong, prey as well as predatory, from their hiding-place. The timid deer, stealing down

to its drinking-pool, never learns until too late its danger from the lurking crocodile or crouching panther. Fat moths sail recklessly into the open mouths of bats and nightjars. Frogs sing their own requiem as the noiseless, hungry otter glides behind them. Mice run in merry abandon under the ready claws of owls. Nature, ever merciless to the individual, never revels more ruthlessly in rapine than at night. It is the very carnival of dark deeds. The stealthy badger grossly devours a nest of screaming leverets; the fox squeezes the life out of a careless pheasant; all Nature's assassins love the cloak of darkness, and not until the sun is once more over the horizon will they and their victims seek the cover that they left in the witching hour of gloaming.

Since the ear is always more sensitive when the eye cannot see, the voices of the night are always memorable. Also, it must be remembered, there are fewer rival sounds. Even the hum of the drowsy dor-beetle, which we should hardly notice in the chorus of the million tongues of day, booms loud and threatening on a June evening. When you have once heard the tuneful choir of bull-frogs in the equatorial night, sounding from the swamp near camp, its music haunts you for years after. The lion's roar is most tremendous in the darkness; by day it might be taken for the booming grunt of the ostrich. The low hooting of some old owl, heard a mile or more on moonlight nights, would at midday scarce be noticed across the street. How much sweeter is the trembling note of the nightingale in Kentish lanes, or of the mocking-bird of Jamaica gardens, in the sable silence of the night than when in daytime it is vainly challenged by a thousand rivals!

And what of the night at sea? About darkness brooding over deep water there is quiet horror, the suggestion of tragedy, the note of hidden violence. You experience this sensation most irresistibly perhaps on the lagoons of Venice, which still conceal the evidences of a million midnight murders. Even on the banks of Tweed, beautiful alike in the light of sun or moon, I have found myself shuddering when, in the absorption of a last cast, the brief October twilight has passed unnoticed, and I have suddenly realised that I was alone with the river in pitch darkness. At sea, with the light at your masthead swinging lazily across the stars, the vastness is oppressive. You feel such a land-worm anchored there between the infinite sea and the infinite sky. The senses are all on edge. The blowing of a little porpoise beside your boat seems the spouting of a mighty whale. A straggling gull, flying back to land from its supper at the pilchard-nets, looms dimly in the half-darkness of the sea like an albatross at the least. When at last the rush of a great fish, maddened by the hook, makes your reel scream, its note of terror finds echo in your heart, so appalling is the hand-to-hand struggle with the unseen. Out in the coral seas, which have steamed all day in a tropical sun, there are dreadful night-creatures on the move. Gigantic white rays, the size of bell-tents, leap high in the moonlight, throwing off coruscations of molten silver ere they fall back on the water with a report that can be heard for miles. Down in the blackness of the water, on nights when there is no moon to light the scene, foul sharks of great size glide beneath our keel, their sinuous course plainly marked by the pale-blue fires of phosphorescence. And every now and then the rod is all but snatched from your grasp as some immense fish tears line off the reel and darts hither and thither with a fury for which, in the impenetrable gloom, you feel no match.

The most fascinating periods of night alone with Nature are its coming and its going. Watch the owls and bats slip forth from their day-retreats, blinking in what is left of the daylight, then seeing better as it fails, and dealing death among the little beasts and insects on which they prey. An early moon sails into the sky and touches the silence with its ghostly silvering, and in such light it takes a poacher's eye to make out the little gray rabbits feeding quietly in the shadow of the hedge, ready to bolt for safety when a crackling twig betrays the enemy. The larger creatures of the night are also difficult to watch, for they know full well how inconspicuous they are in such a shadowland, and until the last moment comes for flight rarely move a muscle in our presence. Those of us who have known the fitful fireflies of warmer nights miss them sadly when we go on sugaring expeditions in our woods at home.

At length the short summer night draws to its close. There is a colder feeling in the air. The moon is down, but another light comes dimly out of the east. The bubbling music of the nightingales in yonder plantation has ceased, as if the leaders of the choir would rest and let inferior artists have their turn. It must be confessed that the voices which hail the coming of day are not of the first order. From an old elm, the top of which catches the first of the new-born light, a pair of doves coo lazily. A pheasant screams its jarring note from the home park. Little bird-voices twitter faintly from the hawthorns as if their owners were uncertain whether to have another nap. As in a dissolving view, the scene grows more and more distinct. Night spreads her black wings in flight. Beasts of ravin slink back to their dens; their time is gone. Even the glow-worms lower their little lamps, for a greater light than theirs is nascent. It is the new day.

THE HOUSE OF WHISPERS.

CHAPTER X.—DECLARES A WOMAN'S LOVE.

AT nine o'clock that night Gabrielle left her father, and ascended to her own pretty room, with its light chintz-covered furniture, its well-filled bamboo bookcases, its little writing-table, and its narrow bed in the alcove. It was a nest of rest and cosy comfort.

Exchanging her tweed dress, she put on an easy dressing-gown of pale-blue cashmere, drew up an arm-chair, and, arranging her electric reading-lamp, sat down to a new novel she intended to finish.

Presently Elise came to her; but, looking up, she said she did not wish to be disturbed, and again coiled herself up in the chair, endeavouring to concentrate her thoughts upon her book. But all to no purpose. Ever and anon she would lift her big eyes from the printed page, sigh, and stare fixedly at the rose-coloured trellis pattern of the wall-paper opposite. Upon her there had fallen a feeling of vague apprehension such as she had never before experienced, a feeling that something was about to happen.

Lady Heyburn was, she knew, greatly annoyed that she had not made her appearance at dinner or in the drawing-room afterwards. Generally, when there were guests from the neighbourhood, she was compelled to sing one or other of her Italian songs. Her refusal to come to dinner would, she knew, cause her ladyship much chagrin, for it showed plainly to the guests that her authority over her step-daughter was entirely at an end.

Just as the stable-clock chimed half-past ten there came a light tap at the door. It was Hill, who, on receiving permission to enter, said, 'If you please, miss, Mr Murie has just asked me to give you this;' and he handed her an envelope.

Tearing it open eagerly, she found a visiting-card, upon which some words were scribbled in pencil. For a moment after reading them she paused. Then she said, 'Tell Mr Murie it will be all right.'

'Very well, miss,' the man replied, and, bowing, closed the door.

For a few moments she stood motionless in the centre of the room, her lover's card still in her hand. Then she walked to the open window, and looked out into the hot, oppressive night. The moon was hidden behind dark clouds, and the stillness was precursory of the thunderstorm which for the past hour or so had threatened. Across the room she paced slowly several times, a deep, anxious expression upon her pale countenance; then slowly she slipped off her gown and put on a dark stuff dress.

Until the clock had struck eleven she waited. Then, assuming her tam-o'-shanter and twisting a silk scarf about her neck, she crept along the corridor and down the wide oak stairs. Lights were still burning; but without detection she slipped out by the main door, and, crossing the broad drive, took the winding path into the woods.

The guests had all left, and the servants were closing the house for the night. Scarce had she gone a hundred yards when a dark figure in overcoat and a golf-cap loomed up before her, and she found Walter at her side.

'Why, dearest!' he exclaimed, taking her hand and bending till he pressed it to his lips, 'I began to fear you wouldn't come. Why haven't I seen you to-night?'

'Because—well, because I had a bad headache,' was her lame reply. 'I knew that if I went in to dinner mother would want me to sing, and I really didn't feel up to it. I hope, however, you haven't been bored too much.'

'You know I have!' he said quickly in a low, earnest voice. 'I came here purposely to see you, and you were invisible. I've run the car down the farm-road on the other side of the park, and left it there. The mater went home in the carriage nearly an hour ago. She's afraid to go in the car when I drive.'

Slowly they strolled together along the dark path, he with her arm held tenderly under his own.

'Think, darling,' he said, 'I haven't seen you for four whole days! Why is it? Yesterday I went to the usual spot at the end of the glen, and waited nearly two hours; but you never came, although you promised me, you know. Why are you so indifferent, dearest?' he asked in a plaintive tone. 'I can't really make you out of late.'

'I'm not indifferent at all, Walter,' she declared. 'My father has very much to attend to just now, and I'm compelled to assist him, as you are well aware. He's so utterly helpless.'

'Oh, but you might spare me just half-an-hour sometimes,' he said in a slight tone of reproach.

'I do. Why, we surely see each other very often!'

'Not often enough for me, Gabrielle,' he declared, halting in the darkness and raising her soft little hand to his eager lips. 'You know well enough how fondly I love you, how'——

'I know,' she said in a sad, blank tone. Her own heart beat fast at his passionate words.

'Then why do you treat me like this?' he asked. 'Is it because I have annoyed you, that you perhaps think I am not keeping faith with you? I know I was absent a long time, but it was really not my own fault. My people made me go round the world. I didn't want to, I assure you. I'd far rather have been up here at Connachan all the time, and near you, my own well-beloved.'

'I believe you would, Walter,' she answered, turning towards him with her hand upon his shoulder. 'But I do wish you wouldn't reproach

me for my undemonstrativeness each time we meet. It saddens me.'

'I know I ought not to reproach you,' he hastened to assure her. 'I have no right to do so; but somehow you have of late grown so sphinx-like that you are not the Gabrielle I used to know.'

'Why not?' And she laughed, a strange, hollow laugh. 'Explain yourself.'

'In the days gone by, before I went abroad, you were not so particular about our meetings being clandestine. You did not care who saw us or what people might say.'

'I was a girl then. I have now learnt wisdom, and the truth of the modern religion which holds that the only sin is that of being found out.'

'But why are you so secret in all your actions?' he demanded. 'Whom do you fear?'

'Fear!' she echoed, starting and staring in his direction. 'Why, I fear nobody! What—what makes you think that?'

'Because it has lately struck me that you meet me in secret because—well, because you are afraid of some one, or do not wish us to be seen.'

'Why, how very foolish!' she laughed. 'Don't my father and mother both know that we love each other? Besides, I am surely my own mistress. I would never marry a man I don't love,' she added in a tone of quiet defiance.

'And am I to take it that you really do love me, after all?' he inquired very earnestly.

'Why, of course,' she replied without hesitation, again placing her arm about his neck and kissing him. 'How foolish of you to ask such a question, Walter! When will you be convinced that the answer I gave you long ago was the actual truth?'

'Men who love as fervently as I do are apt to be somewhat foolish,' he declared.

'Then don't be foolish any longer,' she urged in a matter-of-fact voice, lifting her lips to his and kissing him. 'You know I love you, Walter; therefore you should also know that if I avoid you in public I have some good reason for doing so.'

'A reason!' he cried. 'What reason? Tell me.'

She shook her head. 'That is my own affair,' she responded. 'I repeat again that my affection for you is undiminished, if such repetition really pleases you, as it seems to do.'

'Of course it pleases me, dearest,' he declared. 'No words are sweeter to my ears than the declaration of your love. My only regret is that, now I am at home again, I do not see so much of you, sweetheart, as I had anticipated.'

'Walter,' she exclaimed in a slow, changed voice, after a brief silence, 'there is a reason. Please do not ask me to tell you—because—well, because I can't.' And, drawing a long breath, she added, 'All I beg of you is to remain patient and trust in me. I love you; and I love no other man. Surely that should be, for you, all-sufficient. I am yours, and yours only.'

In an instant he had folded her slight, dainty form in his arms. The young man was satisfied, perfectly satisfied.

They strolled on together through the wood, and out across the open corn-fields. The moon had come forth again, the storm-clouds had passed, and the night was perfect. Though she was trying against her will to hold aloof from Walter Murie, yet she loved him with all her heart and soul. Many letters she had addressed to him in his travels had remained unanswered. This had, in a measure, piqued her. But she was in ignorance that much of his correspondence and hers had fallen into the hands of her ladyship and been destroyed.

As they walked on, talking as lovers will, she was thinking deeply, and full of regret that she dared not tell the truth to this man who, loving her so fondly, would, she knew, be prepared to make any sacrifice for her sake. Suppose he knew the truth! Whatever sacrifice he made would, alas! not alter facts. If she confessed, he would only hate her. Ah, the tragedy of it all! Therefore she held her silence; she dared not speak lest she might lose his love. She had no friend in whom she could confide. From her own father, even, she was compelled to hide the actual facts. They were too terrible. What would he think if the bitter truth were exposed?

The man at her side, tall, brave, strong—a lover whom she knew many girls coveted—believed that he was to marry her. But, she told herself within her grief-stricken heart, such a thing could never be. A barrier stood between them, invisible, yet nevertheless one that might for ever debar their mutual happiness.

An involuntary sigh escaped her, and he inquired the reason. She excused herself by saying that it was owing to the exertion of walking over the rough path. Therefore they halted, and, with the bright summer moonbeams falling upon her beautiful countenance, he kissed her passionately upon the lips again and yet again.

They remained together for over an hour, moving along slowly, heedless of where their footsteps led them; heedless, too, of being seen by any of the keepers who, at night, usually patrolled the estate. Their walk, however, lay at the farther end of the glen, in the coverts remote from the house and nearer the high-road; therefore there was but little danger of being observed.

Many were the pledges of affection they exchanged before parting. On Walter's part they were fervent and passionate, but on the part of his idol they were, alas! only the pretence of a happiness which she feared could never be permanent.

Presently they retraced their steps to the edge of the wood beyond which lay the house. They found the path, and there, at her request, he left her. It was not wise that he should approach the house at that hour, she urged.

So, after a long and fervent leave-taking, he held her in a last embrace, and then, raising his cap, and saying, 'Good-night, my darling, my own well-beloved!' he turned away and went at a swinging pace down the farm-road where he had left his car with lights extinguished.

She watched him disappear. Then, sighing, she turned into the dark, winding path beneath the trees, the end of which came out upon the drive close to the house.

Half-way down, however, with sudden resolve, she took a narrower path to the left, and was soon on the outskirts of the wood and out again in the bright moonlight.

The night was so glorious that she had resolved to stroll alone, to think and devise some plan for the future. Before her, silhouetted high against the steely sky, rose the two great, black, ivy-clad towers of the ancient castle. The grim, crumbling walls stood dark and frowning amid the fairy-like scene, while from far below came up the faint rippling of the Ruthven Water. A great owl flapped lazily from the ivy as she approached those historic old walls which in bygone days had held within them some of Scotland's greatest men. She had explored and knew every nook and cranny in those extensive ruins. With Walter's assistance, she had once made a perilous ascent to the top of the highest of the two square towers, and had often clambered along the broken walls of the keep or descended into those strange little subterranean chambers, now half-choked with earth and rubbish, which tradition declared were the dungeons in which prisoners in the old days had been put to the rack, seared with red-hot irons, or submitted to other horrible tortures.

Her feet falling noiselessly, she entered the grass-grown courtyard, where stood the ancient spreading yew, the 'dule-tree,' under which the Glencardine charters had been signed and justice administered. Other big trees had sprung from seedlings since the place had fallen into ruin; and, having entered, she paused amidst its weird, impressive silence. Those high, ponderous walls about her spoke mutely of strength and impregnability. Those grass-grown mounds hid ruined walls and broken foundations. What tales of wild lawlessness and reckless bloodshed they all could tell!

Many of the strange stories she had heard concerning the old place—stories told by the people in the neighbourhood—were recalled as she stood there gazing wonderingly about her. Many romantic legends had, indeed, been handed down in Perthshire from generation to generation concerning old Glencardine and its lawless masters, and for her they had always possessed a strange fascination, for had she not inherited the antiquarian tastes of her father, and had she not read many works upon folk-lore and such-like subjects?

Suddenly, while standing in the deep shadow, gazing thoughtfully up at those high towers which, though ruined, still guarded the end of the glen, a strange thing occurred—something which startled her, causing her to halt breathless, petrified, rooted to the spot. She stared straight before her. Something uncanny was happening there, something that was, indeed, beyond human credence, and quite inexplicable.

(To be continued.)

NOTES FROM AN OLD DUTCH CHRONICLE.

HOW few among the visitors who stroll along the shore at Lowestoft in the summer-time, enjoying the fresh sea-breezes, give a thought as they look seaward about an event which happened nearly two hundred and fifty years ago only a few miles out from the beach! Yet it was here that a great naval engagement took place between the fleets of England and Holland, terminating after much bloodshed in a victory for England, but fought to a finish with all the bravery and splendid seamanship for which both English and Dutch were renowned. It is wholesome sometimes to reconstruct in the mind's eye those episodes of pluck and energy which adorn the pages of our national history, but which, alas! in these degenerate days are often supplanted by far less desirable forms of literature. You have perhaps to acquire the taste for historical research before you are fully alive to the pleasures it can provide; but when once you realise that every town and village you visit has its place and part in the story of our national life, the dullest spots become romantic, and even the Lowestoft shore can be made to ring again with the guns of a mighty battle.

It will be necessary to remind the reader of the troubles which had given rise to a state of war between Holland and England. Ever since Holland had become firmly constituted as a republic her prosperity had greatly increased, owing to the extension of her commerce with all parts of the world. She was England's rival on the seas, and her naval commanders, such as Admirals Van Tromp and De Ruyter, were quite equal to any men who then were at the head of our navy. The English Channel is not a very broad sea, and it may be supposed there was not too much elbow-room for rival fleets to manœuvre without constant collisions. Also, in those days the merchant-vessels required an attendant escort of warships when traversing the ocean, for piracy was a profession, and no declaration of war was needed for the privateers to help themselves to any rich merchant-

man that came their way. England had exacted from Holland the right to have her flag saluted whenever the English and Dutch ships met, on the principle that Britannia rules the waves, and this was not altogether to the Dutchman's liking.

In the reign of Oliver Cromwell, Admiral Blake was our greatest admiral, and a small affair which occurred on the seas at that time will give a very fair illustration of the way in which matters between these rival fleets were conducted. I quote from a report addressed to the Dutch Parliament by the great Admiral Cornelius Van Tromp. He says: 'High and Mighty Lords, since my last of the 20th instant, after having cruised before the Meuse, Wielengen, Ostend, and Newport, till the 24th, we were forced to weigh anchor because of the boisterous weather; and the tempest growing still more furious, several captains came aboard the Admiral to inform him what anchors and cables they had lost, some of them having but two left; and because the wind continued to grow more violent, we resolved, for the preventing of a greater disaster, to make towards the coast of Dover. We got into the Downs at one o'clock, when I immediately despatched away Captain Theyssen, of Flushing, and Captain Allen to compliment Bourne, who was then riding there with a squadron of the English fleet under his command, and to desire him from me to take no alarm at the sight of the Hollanders upon the coasts of England, because it happened only by an unexpected effect of the tempestuous weather, and to assure him they had no other design than to refit their vessels in order to return as soon as they could towards the frontiers of the State, and that the orders we had from the States-General concerned only the security of our trade and fishing and maintaining the glory of our nation. Bourne, having heard this message, made answer thereto with fine compliments, which he charged my two officers to make me, desiring them withal to return me his thanks for my advertisement. The 29th of the same month we unmoored with a wind blowing fresh at north-east, steering our course towards Calais, with design to go and cruise upon our own coasts to refurnish ourselves with anchors and cables. In our way we met fifteen of the Parliament's men-of-war or frigates, upon which I presently lowered my sails, and struck my flag, *in order to pay the honours due to the banner of England.* Being come within cannon-shot, the English Admiral let fly a shot at me, to which I made no answer. He then gave me another, to which I answered, upon which he let fly a whole broadside at me, which made so great havoc on board me that several of my men were wounded, and some of them had their arms or legs shot off. I then likewise discharged a broadside at him, yet was not able all this while to discover what the English meant by this, so great a silence there was kept on both sides. And thus the two fleets came all on a sudden to be engaged in a general battle. In the meanwhile Major Bourne, having come out of the Downs with a squadron of twelve men-of-war, whereof the first carried from sixty to seventy pieces of cannon, and the others from thirty-eight to fifty, came and fell thundering upon our rear. So the fight, being begun at four in the afternoon, lasted till nine, and was not broken off but by the obscurity of the night. Then we made out into the main sea, and the ships of both fleets tacked about towards their Admirals to refit themselves.'

The above is an extract from Van Tromp's letter, and it gives a very good idea of the free-and-easy way a sea-fight was got up in those days, without any provocation and without any declaration of war. It is true the English Admiral, reporting this engagement to Cromwell, gives a denial to Van Tromp's statements, and declares that the first shots he fired were only blank, to warn the Dutchman to dip his flag. The truth, however, was clearly on Van Tromp's side, for if he had entertained warlike intentions he certainly would have attacked the twelve warships in the Downs in preference to the fifteen vessels under Admiral Blake, which he met with afterwards in the Channel. This affair led to very serious results, and there were long debates in Parliament about it, and special envoys were sent over from the States to endeavour to bring about a peaceful solution. The upshot of it all was that Parliament and Cromwell supported Blake, and war was declared. The old Dutch chronicle quaintly remarks that all the time these negotiations were proceeding, the English privateers were capturing every Dutch ship they met, and that no nationality was safe, the French and Spanish ships suffering in the same way.

Some idea of the damage inflicted by these sea-fights with the Dutch in the Commonwealth period may be gathered from the fact that during two years, from 1652 to 1654, the English took no less than one thousand seven hundred Dutch prizes, valued at six millions sterling, while the prizes taken by the Dutch from the English amounted to about a fourth part of this in number and value. The English account states that during that time they were victorious in five general battles, some of which lasted several days, whereas the Dutch gained no victory, though in two engagements they were partially successful.

The Dutch chronicle does not altogether allow this, and a short extract from the account of one of these sea-fights throws a different light upon the subject. Tromp had gone out into the Channel with his fleet to convoy some merchantmen, when, passing near Portland, he came in sight of the English fleet. At this point the chronicle says: 'The two fleets were scarcely advanced within cannon-shot of one another, but Tromp tacked about upon Blake, who presently began to play upon him with all his artillery, though without doing Tromp any great harm, because he was at such a distance from him. But the latter, for-

bearing to fire till he came within musket-shot of his enemy, let fly at him a broadside, and, then tacking about nimbly, he fired a second at him on the same side; and then flanking him again on the other side, thundered off a third at him with so great success that there was nothing but cries and groans to be heard on board of Blake, who fought after that only in retreating and sheering away as far as he could from Tromp, who ceased not to pursue him. After this *præludium*, the two fleets intermixing one with another, the battle grew so furious that there was little else to be seen but masts overturned into the sea, and splinters flying on all sides, sails rent in pieces, and masts and cables cut short in sunder. In one place the enemy was boarding our ships, and in a moment after were chased off again, where they were seen to be blown up into the air with the deck they stood upon. And on another side was seen a ship swallowed up by the waves with several hundreds of men, and the sea turned red with human blood and covered over with dead bodies and floating pieces of shattered ships.' This account does not place the victory all on the English side, and there can be little doubt that it was the numerical superiority alone of the English that gave them eventually the command of the sea. Shortly after the above event Admiral Van Tromp was killed in action, and a peace followed which was kept until the Restoration.

Of all men, King Charles the Second should have been the last to quarrel with the Dutch. That republic had housed and sheltered him when other States would not allow him to reside in their territories. Circumstances, however, were stronger than the king's wish, and he was driven to declare war with Holland in the month of February 1665. The fact was that trade disputes had arisen between our East India Company and the Dutch Company, and there were difficulties also between the two countries in the West Indies. Jealous rivalries soon led to reprisals by sea and land, and the old piratical habits of both peoples quickly revived, and there was no solution but by an appeal to arms. Both nations had able commanders. The English navy had the Duke of York at its head, and the Earl of Sandwich acting as second in command, while the Dutch could boast of the brave De Ruyter, whose prowess at sea eventually was to be made famous by his burning our ships in the Thames.

The moment war was declared each nation made hurried preparations, and the English, a little beforehand with their enemy, sailed for the coast of Holland on April 21, 1665. After a few weeks, the weather turning foul, the English fleet returned homewards, followed by the Dutch, who appeared about the end of May near the Dogger Bank. The Dutchmen had for their admirals commanding the squadrons, Opdam, with fourteen men-of-war; John Everts, with a similar force; Stillingwert, equally equipped; Van Tromp (the son of the famous admiral), with sixteen ships; and other commanders, making a total of one hundred and three men-of-war, eleven fire-ships, and seven yachts—a truly formidable navy in those times. Our fleet consisted of one hundred and fourteen men-of-war and frigates, twenty-eight fire-ships and ketches, and about twenty-two thousand seamen and soldiers.

On 8th June the English fleet put out from Gunfleet Bay, where they had been refitting, and came to anchor in Southwold Bay. The wind being easterly, the English kept next day off Aldborough, and about midnight the Duke of York received intelligence that the Hollanders were approaching. Several merchant-ships which were victualling the English were now ordered to return to shore, and preparations were begun for attacking the enemy. The wind veered to the south-west, which gave the English the advantage of the weather-gage. It was now about three o'clock in the morning, and the opposing fleets, six miles off Lowestoft, approached each other in extended lines, and not, as was usual, in crescent form. The Dutch briskly attacked the ships under Prince Rupert, breaking through their line and then re-forming. This was repeated at six in the morning, both sides vigorously cannonading. Meanwhile the squadron under the Duke of York had not been engaged, and it was impossible for the Dutch to get the weather-gage from them. Matters were in this condition till about one o'clock in the day, when the Earl of Sandwich, advancing with his ships, divided the Dutch fleet in two.

The ships were now at close-quarters, and the battle raged furiously. Admiral Opdam brought his vessel alongside the *Royal Charles*, which was the flagship of the Duke of York, and the two Admirals thundered their guns at one another with continual broadsides. The Duke of York was in the utmost danger. By his side were the Earl of Falmouth, Lord Muskerry, and Mr Boyle, and one cannon-ball killed these three gentlemen, bespattering the Duke with blood and brains, and a splinter from Mr Boyle's skull actually wounded the Duke in the hand. For a few moments it looked as if Admiral Opdam would succeed in boarding the *Royal Charles;* but by some accident not clearly explained the powder-magazine of Admiral Opdam's ship exploded, blowing up the Admiral and all his crew. It was said at the time that a negro servant of Opdam's did this to revenge himself for being beaten by his master; but in the midst of fighting a spark from the guns at such close-quarters would reasonably explain the disaster. No less than five hundred men perished in this explosion, many of them sons of the best families in Holland.

The death of Admiral Opdam was a great blow to the Dutch, who began to show signs of weakening. They had been successful in capturing one English ship, the *Charity*, the captain of which had escaped in a boat to the English shore, only some six miles distant.

A fresh misfortune now befell the Hollanders. Three of their largest ships fouled with one another,

and became so entangled with their spars and rigging that it was impossible to cut them apart. The moment this was seen by the English they quickly sent a fire-ship among them, and all three were reduced to ashes. The seamen leapt into the water; and the fire, which had reached the powder-magazines of the ships, ignited their contents and blew the vessels to bits. It was evident now that victory would crown the efforts of the English, who pressed on the ships which were beginning to retreat. Two more Dutch Admirals fell, one with his body cut in two by a cannon-shot, and the other with his leg blown off.

It was now seven in the evening, and the battle had been raging since three on the previous morning. Martin Van Tromp held out, fighting to the last, with a small number of ships. He was five times engaged in the midst of the English, the chronicle tells us, and furiously battered by their guns on every side, and so covered in thick smoke that his seamen openly ascribed to a miracle the preservation of his ship and person. He was the last to leave the scene of this savage fight and make his way to the Dutch coast, slowly followed by the enemy. This was the most signal victory the English ever gained, and the severest blow the Dutch ever felt at sea. According to accounts, the Dutch had eighteen ships taken, and fourteen burnt or blown up. We lost one ship, the *Charity*, of forty-six guns, with most of her men, and altogether we had two hundred and fifty killed and three hundred and forty wounded. This was a small loss compared with that of the Dutch, whose numbers were six thousand killed and two thousand three hundred prisoners.

What particularly strikes the reader of these bygone sea-fights is the marvellous endurance and tenacity with which they were conducted. This battle lasted above sixteen hours, and most of the time the ships and men were in close grip—to push of pike, as the old chronicle has it. There was no shooting at two miles range, but the broadsides were poured in when the ships were at close touch. It is true the penetrating power of the guns could not be great, and the cannon-balls no doubt became embedded in the thick oak planks without causing great leakage. But the battle was determined in those days by the personal bravery and endurance of the men rather than by straight shooting and high explosives. They were grand fellows those old sea-dogs, and it must be remembered that they were the forefathers of our navy, and they deserve a word of praise and admiration when we read about their gallant deeds. Their bones lie scattered round our shores, and from time to time the restless ocean casts up some fragment from the deep, which, if it could speak, would tell us that its sacrifice was made for love of home and country, and for the sake of the little English children who now build their sand-castles beside the summer waves.

THE MONTH: SCIENCE AND ARTS.

NEW CHEMICAL CLEANING PROCESS FOR FABRICS.

AMONG the many anxieties confronting the housewife, that pertaining to the cleaning of textiles, such as carpets, curtains, &c., is among the most perplexing. Not only do such articles become heavily laden with dust, but the latter works its way so deeply and firmly into the fibres as to tarnish the lustre of the colours, and precipitates dry-rot. Recourse to violent measures, such as beating or vacuum cleaning, only partially removes the evil, with the attendant dangers of tearing away the nap or loosening the woven foundation; while washing, even if practicable, and the utilisation of special preparations which are composed largely of deleterious chemicals, are equally prejudicial to the life of the textiles. An ingenious process, however, devised by a French inventor, which has recently been introduced into this country, completely enables all the foregoing disadvantages to be overcome, and fabrics restored to their original brilliancy. The medium employed is simply the volatile, though highly explosive and inflammable, spirit-naphtha, which dissolves the dust, grease, or stains without inflicting the slightest damage. Moreover, by means of the ingenious machine with which the cleaning operation is carried out, the combustibility of the naphtha is completely negatived. The articles to be treated are placed in a cage, which in turn is inserted in an airtight cylindrical vessel so mounted that it is free to revolve. As it is the presence of moisture or hydrogen in the air which renders naphtha so inflammable, the air is withdrawn from the cylinder, leaving the articles in a vacuum. A stream of the spirit is then allowed to flow into the cylinder, and, as a further safeguard against ignition or explosion, all remaining space in the vessel is filled with carbonic acid gas. The cylinder is then rapidly revolved, and the violent agitation thus set up within forces the spirit through and through the textiles enclosed until all the dirt has been dissolved out of the threads. In a short time the naphtha is drawn off in a muddy stream, and currents of fresh air swept through the vessel, which evaporate any spirit remaining in the fabrics. When, finally, the articles are withdrawn they are as clean as when they were new, absolutely undamaged, and perfectly odourless. The process is a highly economical one, since the murky naphtha, after being drawn off, is passed through a distilling process, by which the dissolved grease and dirt are separated, leaving the spirit available for

re-use. Consequently the consumption of spirit is very small.

INEXPENSIVE BUILDING.

A new building system which should prove distinctly advantageous in places where brick or masonry is expensive, and which has extensive possibilities for bungalows and similar residences, has been successfully adopted in Ceylon and India. After the framework of the structure has been completed, expanded metal, which resembles the familiar wire-netting, only of much greater strength and solidity, is stretched between the members. Over this is placed a coating of cement of any desired thickness, which can be externally finished in rough-cast or any other desired style, while the interior is completed in the usual manner with plastering. The principle admits of very economical and rapid construction. The walls are hollow, and of great strength, impervious to rain, wind, or other adverse influences, fireproof, and practically indestructible. If desired, the outward appearance can be easily fashioned to resemble solid masonry. Internal walls are executed in the same manner, and are superior to the partitions generally erected, inasmuch as they are stronger and sound-proof. As the requisite materials are comparatively inexpensive in this country, such a system might very advantageously be adopted. So far as prime cost is concerned, the system will be found to compare in many cases with the materials generally used, and with an appreciably superior result.

NOVEL FISH-INCUBATOR.

An improved apparatus for the hatching of the eggs and rearing of the spawn of fish has been recently devised. It comprises an open trough, having two compartments of varying dimensions, the smaller being placed within the larger. The fresh water flows into the smaller tank, and then passes through small perforations at one end into the larger compartment, which is the spawning-tank. The bottom of this second receptacle is freely pierced with holes smaller than the fecundated eggs placed thereon, so that the latter cannot slip through. By means of this arrangement it is possible to secure a strong, continuous circulating current of water with less consumption of the latter than is possible with the system now in vogue. Owing to the side inflow and under outflow of water in the larger compartment, complete aeration and constant washing of the eggs throughout the whole area are assured, the lower layers of eggs and those resting in the corners of the tank being as favourably treated as those in the centre and at the top. The arrangement also ensures the equal distribution of the living food or 'plankton,' since the current sweeps it equably over every part of the tank throughout its length, breadth, and depth, enabling regular and equal growth of the small fry to be obtained. Cleaning is equally simple, since, owing to the rotary character of the current, all the impurities gather in the centre of the sieve-bottom, whence they can be removed very quickly by the aid of an india-rubber pipe having a perforated fitting at the end attached to the tank, through which the foreign matter is drawn off, this pipe having a siphoning action.

WILL THE PANAMÁ CANAL PAY?

Already considerable discussion is being raised concerning the ultimate commercial prospects of the Panamá Canal. This is a problem which is occupying the close attention of economists, and be it noted the fiercest contributions to the debate are emanating from Americans. When the United States first suggested acquiring the French concession the success of the Suez Canal was advanced as showing the assured prosperity of this waterway across the isthmus, especially as it was argued that the major part of the traffic between Europe and the Antipodes would favour the trans-American route. But will this be the case? So far as Europe is concerned, such a deviation is somewhat doubtful, since the distance *viâ* Suez to the East will be practically the same as by Panamá. It must be remembered also that Suez is on one of the greatest sea-trade highways in the world. On this route the mercantile marine taps a continuous string of the busiest markets, while *viâ* Panamá no such advantages are offered. Moreover, strange to relate, the shortest journey between New York and Hong-kong, the door of China, will even then be *viâ* Suez. To the Australian traffic the Panamá Canal will be of certain advantage; but even then it must be borne in mind that more commercial ports can be touched by the old route, and it is a moot point whether the possibilities of new traffic offered by the somewhat shorter journey through the Panamá ditch will be such as to tempt shipping from a course upon which it is already firmly established. But apart from these considerations, the Panamá Canal will experience severe competition from alternative routes on the American continent itself. By the time the canal is completed the Tehuantepec railway across the Mexican isthmus to the south, and the Grand Trunk Pacific, with its new port at Prince Rupert on the north, will be in full swing. Taking the Tehuantepec line first, New Orleans will be one thousand eight hundred and fifty-four miles and New York one thousand one hundred and eighty-two miles nearer San Francisco *viâ* the railway than by the canal, while the saving on the distance between Liverpool and San Francisco by the iron road is about eight hundred miles as compared with the waterway. It will be argued that in favouring the railway breaking bulk is necessary; but the facilities that are being provided at each end of this one hundred and eighty-nine miles of trans-continental line for transhipment are such as to reduce the delay and cost to the minimum, which in any event will be less than the canal dues. By the new Canadian trans-continental railway, New York, Chicago, and the other prosperous industrial centres in the north of the States will have their distance to Japan

shortened by over one thousand miles. The United States Government is, however, relying on the patriotism of the citizen to ensure the prosperity of its enterprise, but it is to be feared that loyalty is but an indifferent reed upon which to lean, and that it will find the American quite as mercenary as the business man of any other nation where speed, lower freights, and other advantages are concerned in the strenuous hustle for trade supremacy. From the military point of view, the canal will be distinctly valuable to the States; but there are many who affirm that the undertaking, which will cost some seventy million pounds, may prove to be the most colossal commercial blunder in the world's history.

THE FOOD-VALUE OF AERATED WATER.

In the course of a recent lecture Dr E. Symes Thompson, Gresham Professor of Medicine, drew attention to the food-value of water. In the course of a day each person requires some two and a half pints of this liquid to keep the human machine working smoothly. In addition to its dietetic value, water serves as the best vehicle for various fluids moving about the body. It is essential, however, that attention should be devoted to the selection of water; and, curiously enough, pure water is not altogether an advantage, owing to its solvent properties. For instance, when pure water flows through leaden pipes a certain proportion of the metal becomes dissolved, the introduction of which into the human system is prejudicial. On the other hand, hard water does not have this effect. The most beneficial results are obtained from water which has been aerated, since the effervescence moves the fluid of the stomach, thereby facilitating digestion. It is for this reason that the sparkling waters of certain health-resorts exercise such valuable effects; but to those far removed from such places aeration is somewhat difficult. Happily, the end can now be met by means of a simple scientific invention, whereby the requisite gas is stored in small metal cases about half the length of the finger, which, discharged into a siphon charged with pure water, aerates the contents. The siphon can be charged whenever desired, and effervescent water can be successfully obtained at home in the course of a few seconds. If such water were more freely partaken of, no doubt many of the little ills to which flesh is heir, and which are directly attributable to indigestion, could be satisfactorily avoided.

A SAFE MOTOR-CYCLE TRAILER.

One of the greatest disadvantages to the rider of the motor-cycle is its loneliness. Cyclists are proverbially gregarious, and certainly there is nothing more depressing than a compulsory long ride in solitary state. By the introduction of the trailer, which could be attached by a connecting swivelling joint to the saddle of the cycle, efforts to remove this drawback were made; but the rearmost vehicle proved to be a serious danger not only to the occupant but to the cyclist as well. Consequently the trailer has fallen into desuetude. It should, however, regain popularity by means of the new coupling-device which has recently been perfected. Instead of the car being coupled to the saddle, the rear wheel of the cycle is fixed between two projecting shafts of a small bogie carriage, upon which the rear car is carried, in much the same manner as a horse is harnessed to a cart. These side-shafts are secured to the spindle of the back-wheel by a nut on either side. Further security is obtained by fastening two diagonal stays projecting from each shaft to the saddle-pillar, similarly attached by screw-nuts. The result is that the back-wheel of the cycle comes beneath the upward sloping footboard of the rear car. Instead of imperilling the equilibrium of the cyclist, this arrangement gives him additional stability, since, being held in the frame, the machine is converted into a tricycle, and the cyclist does not have to exert effort in maintaining his balance. The system is more advantageous to the motor, since the load is equally distributed on each side, and a straight pull is obtained. The arrangement is so simple that the rear vehicle can be attached or detached in two or three seconds, and is free from liability to overturn, especially when rounding corners. The attached carriage can be obtained to seat either one or two passengers side by side, and if required can be fitted with a hand-propelling device to assist the motor in negotiating a hill. Moreover, its employment does not entail any increased consumption of petrol or impose any harder work upon the motor. It certainly indicates the most important development in motor-cycling that has yet been devised to increase the pleasures of this sport.

FINGER-STRETCHER FOR PIANOFORTE PRACTICE.

A simple device which should prove useful to students of the pianoforte has been devised, which is described as a finger-stretcher. It consists of a semicircular plate, having a semicircular groove. Four wedges, so shaped that they fit into the free spaces between the fingers, can be moved along this groove and secured in any suitable position by screws. In this way the pupil can obtain an absolute regulation of the spreading of the fingers, and by repeating the exercise regularly and cautiously improve their pliability and mobility.

EFFICIENT NON-SLIPPING TIRE FOR CYCLISTS.

Like his motoring confrère, the cyclist is a victim to side-slip upon greasy, sodden road-surfaces, more especially in towns and cities where the wooden and asphalt paving in a wet condition is particularly liable to precipitate sudden disaster. Avoidance of this ever-present menace with the ordinary tire is impossible, as experience has strikingly shown, so that under such conditions the rider is continually tempting fate, no matter how expert he may be. These dangers are, however, completely circumvented by the new cycle-tire that

has been recently introduced. A leaf has been taken from the motorist's experience by the adaptation of the non-slipping protecting band to the outer cover. The principle is precisely the same as that of the motor device—a strip of leather an inch in width, carrying two rows of steel studs about a quarter of an inch square, around its periphery, being firmly attached to the tread of the tire. The studs are placed about an inch apart in each row; but as they are 'staggered,' the distance is reduced to only half an inch between each metallic surface. The result is that a sufficient number of the studs is always in contact with the ground at one and the same time to secure a good grip even upon the most slippery or greasy surfaces, so that it is impossible for the rider to lose his equilibrium suddenly and unexpectedly. The tire has been tested during the past few weeks in London—during which period the weather has been unduly inclement, presenting road-surfaces that for slipperiness would outrival a polished ballroom floor or sheet of ice—with unique success, not the slightest tendency towards side-slipping being observed on the part of the machine thus equipped. Such a gratifying achievement upon London streets, which have an evil reputation for greasiness, should be adequate to ensure the success of the invention. It enables one to ride in safety among the thickest traffic under the most abominable road-conditions. As the tire is reasonably priced, rendering it capable of competition with the best grades of ordinary smooth rubber tires, it is brought within the reach of every devotee of the wheel, and so should meet with widespread appreciation.

NOVEL SMOKELESS BOILER-FURNACE.

An interesting and ingenious idea which should go a long way towards solving the smoke-problem has recently been devised, especially as it has been designed upon sound commercially practicable and economic lines. Briefly described, the principle involved constitutes the utilisation of producer-gas as an auxiliary fuel to the ordinary small coal. The apparatus comprises a gas-producer which delivers at the far end of the furnace, behind the coal-fire but in front of the chimney opening, a volume of gas, by means of which a second combustion is set up. The result is that the smoke from the furnace is forced by the draught along the flue until it reaches this intervening wall of intensely hot flame, where it is consumed, so that no vitiating clouds of carbon particles are discharged into the atmosphere. Some demonstrations recently carried out in London strikingly illustrated the efficiency of the system. An ordinary Lancashire boiler was used for the tests, and whereas at first dense clouds of black smoke were emitted from the chimney, almost directly the gas-flames were brought into action smoking ceased. The system should recommend itself to industrial concerns, inasmuch as the apparatus enables a saving ranging from 30 to 40 per cent. to be effected in the cost of fuel, besides contributing to a clearer and more hygienic atmosphere.

MOTH-TRAPS.

The larval stage of several species of moths is exceedingly destructive to forest trees—in some districts amounting to a veritable plague—and various means of combating these pests have been devised by forest entomologists. One of the most ingenious of these methods has recently been subjected to a fresh test at Zittau in Germany. It is a matter of common observation that light exercises a strong attractive power for this group of *Lepidoptera*. The servants of electric companies frequently report the presence of large numbers of moths in the arc lights, especially in rural and suburban districts. Several years ago this fatal fascination was made the basis of a method of what was intended to be a wholesale slaughter in places where the insects occur *en masse*. The plan consisted in the installation of electric arcs in infested areas, behind which were powerful exhausters. No great measure of success resulted, although several trials were made. The moths fluttered in dense swarms within the rays, but would not approach sufficiently near to be drawn in by the draught created by the exhauster. From the results recently obtained at Zittau it is evident that, with certain species at any rate, the method is likely to have fruitful results. What are known as 'brown moths' (probably *Liparis dispar*) had produced effects so disastrous on some of the local forests that a war of extermination was deemed imperative. Two powerful reflectors and exhaust-fans placed over a deep receptacle were erected on top of the municipal electric plant. From these two broad streams of light were thrown on the woods, which occupy the sides of a hill half a mile distant. The results have been astounding: over three tons of the moths were lured to death as the result of the first night's operations. It has been decided to have a similar installation on the Rathhaus tower.

EGG-POWDER.

Last year an account was given showing the remarkable degree of sterilisation effected by the Ekenberg process for the manufacture of powdered milk. Apart from the benefits resulting from thorough sterilisation, there are other advantages attendant upon this process, and it is not surprising to learn that the method of desiccation is likely to be extended to another agricultural product—namely, eggs. Quite recently effort has been made to obtain this product in the convenient and portable form of a powder, and intelligence comes from Melbourne, Australia, that some degree of success has been attained. The method adopted is somewhat similar to that which has been found successful in the manufacture of milk-powder, with minor differences involved by the varying nature of the two products. In order to secure that only clean, fresh eggs are employed, they are made to pass through a dark room on a perforated rolling

table over a fifty-candle-power light. By this means unsound and dirty eggs are detected and withdrawn. The remainder are passed on to a high-speed centrifugal separator, where they are smashed, and the liquid contents freed from the shell and passed on to a tank. In a chamber below this tank are a series of large cylinders, each revolution of which takes from one to two and a half minutes. A temperature of from one hundred and twenty to one hundred and thirty degrees Fahrenheit is maintained in this room. The liquid eggs are withdrawn from the tanks above into troughs below the cylinders. With each revolution of the latter they carry with them a coating of the liquid eggs, each successive coating being dried by the high temperature of the room before returning to the trough. When the coating has attained a sufficient thickness it is removed and ground to powder. The powder so derived differs from the original eggs in the absence of water only, and it is claimed that it will keep for years.

HANDLOOMS WORKED BY ELECTRIC POWER.

In the *Bollettino della Cotoniera* reference is made to a statement of the United States Consul at Glauchau that a weaver of the district has made an invention whereby every handloom can be worked by electric power imparted through the medium of a spring. Every loom fitted with the apparatus answers all the requirements of a handloom, and works with a gentler motion. The cost of this electric power is stated to be about one and a half lire per week. So simple is the working that a child can direct it.

COTTAGE PLANNING FOR TOWNS.

Recently an interesting cottage competition was held at Newcastle. The municipal authorities have acquired an extensive estate, and it was resolved to make avail of this opportunity towards a solution of the housing problem, which is as acutely affecting this town as others in various parts of the country. The erection of terraces of flats huddled together in order to secure the maximum revenue from the land was advocated in certain short-sighted quarters, but common-sense prevailed. A section of the estate was apportioned for an exhibition of varying classes of houses, ranging from a small dwelling costing inclusively one hundred and ninety-five pounds upwards. In this competition, while artistic elevation was not stifled, it was made secondary to internal planning, the idea being to secure airy, spacious, well lighted and ventilated apartments, suitable to the humbler classes of the social scale. In this connection distinct success was achieved, and it showed that at last architects and builders have realised the far-reaching possibilities in such a range of work. While superfluous external attractiveness was suppressed, every attempt to avoid monotonous barracky elevations was avoided, and in this direction the designers evinced commendable aptitude. The dwellings were kept well isolated, and provided with long gardens, so that degeneration into slums is rendered remote. Another noticeable feature deserving of commendation was the elimination of out-buildings, which constitute such an ugly, though frequent, feature of such houses. The judges did not fail to record their appreciation of the real advance recorded in cottage planning as carried out in this competition; and should the whole of the estate be planned in accordance with the same principle, the municipality of Newcastle will have achieved something distinctly practical towards carrying out the ideals to be embodied in a forthcoming Act of Parliament. Though it is not desirable that municipalities should effect such work upon unbusiness-like lines, it is incumbent upon them to do all in their power to further the welfare of the working-classes. It only needs the exercise of a little sound common-sense such as this corporation has exhibited.

THE 'BUSINESS MAN'S HANDBOOK.'

To have a book at hand which will answer troublesome questions and be a referee in times of doubt and difficulty is a comfortable and helpful thing. Messrs Curtis, Gardner, & Co., London, publish the *Business Man's Handbook*, which the publishers call an encyclopædia of figures, calculations, tables, references, with a good index. We find tables of weights and measures, helps to solutions in matters of science and mechanics, printers' tables, sizes of paper and type, something about paperhangings, bricklayers' measurements, with ready-reckoner and interest table, legal memoranda, and the time in different countries. 'This reminds one of a volume which used to be in general circulation, entitled *Enquire Within Upon Everything*.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor.

THE SNOWDROP'S MESSAGE.

A LITTLE snowdrop, fresh and fair,
Close-nestled to a sunny slope!
I gather it with tender care,
And name it Hope.

This dainty flower I send to you,
While silver chimes ring out above;
But you must christen it anew,
And call it Love.

E. MATHESON.

*** TO CONTRIBUTORS.

1*st*. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'

2*nd*. For its return in case of ineligibility postage-stamps should accompany every manuscript.

3*rd*. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, *should have the writer's Name and Address written upon them* IN FULL.

4*th*. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

ANTOINE MARCOURT & COMPANY.

By ANDREW W. ARNOLD, Author of *The Attack on the Farm, At the Sign of the Silver Bell,* &c.

CHAPTER I.

WHEN, towards the end of April 1812, we Dragoons got *la route* at Alcanez for Mequineza, from whence we were to start for France, we were all filled with delight, for we had been in Spain three years, and were heartily sick of it. We were all glad, I say; but I doubt if there was a single one who received the news with greater pleasure than myself, and for two very good reasons. My father, Comte Antoine de Marcourt, had nearly been ruined by the Revolution. Instead, however, of wringing his hands and bewailing his fate, as so many did, he saved what he could from the wreck; then, to the horror of his aristocratic connections, dropped his title, went into commerce in Marseilles, and by his shrewdness, industry, and, above all, his integrity, in ten years he became one of the richest merchants in that great city. Alas! towards the end of 1811 a bank failed; that ruined hundreds, and even affected the credit of Antoine Marcourt & Company. However, he managed to weather that storm; but recently I had heard from my brother, who was a partner in the firm, that the English had captured two valuable ships, and he told me that he feared they would have to suspend payment. Apart from the anxiety caused by these misfortunes, I was eager to return because I was betrothed, and I had not seen my fiancée for such a long time. I had, on hearing of my father's financial difficulties, written to her offering to release her; but she wrote at once saying that, for richer or for poorer, she would marry no one else. No wonder, then, when all seemed so black, that I should long to clasp the noble and beautiful girl in my arms once more.

On arriving at Mequineza we found half a regiment of artillery (twelve guns) and a battalion of infantry awaiting us. Much to the disgust of our chief, Colonel Ferrières, who had hoped to be in command of the column, he found that Colonel Lavigny of the artillery was his senior.

We Dragoons barely numbered two hundred and fifty sabres, all that remained of the five hundred and twenty who had entered Spain three years before; and we knew we should be lucky if we arrived at our depôt at Lyons without losing more, as the mountains were infested with guerillas under the famous monk Rico. This fellow—unlike Julian Sanchez, Mina, and others—did not do so much fighting himself; but there was no limit to his audacity and cunning in finding out our movements. It was said that on one occasion, at a country inn, he actually waited on General Foy and his staff; and when the wine went round he learnt a good deal that he afterwards turned, alas! to very good account. Luckily, with all his cunning, he could not help boasting of this, otherwise we should never have known it. Whether this rogue was actually in Mequineza or not we could not tell, as he had so many disguises, one day posing as a beggar, and another as an *arriero* (muleteer), &c.; but as he was known to be in the district, we all felt sure that he knew of our departure, so we took very good care to circulate a false report that we were going to the frontier *viâ* Manezon, whereas it was our intention to go to Lerida by following the course of the Segre, a tributary of the Ebro, and on through Urgel and Andorra.

Of course we should have liked our colonel to be in command, but otherwise we could not have had a better leader than Colonel Lavigny. He was a ruddy-faced, merry little man, and a *bon viveur;* but, for all that, a good soldier. All went well for the first two or three days. We had passed Lerida, and were within a league of Cervera, and had halted for the night at a little village called Medrussa, when our first misfortune arrived. For though no precautions had been omitted, yet, when the roll was called the next morning, six gunners were missing; and on a search being made, their bodies—in a shed on the outskirts—were found lying together, all stabbed just above the heart. A sentry had been placed very near; but he had seen no one approach, and how these poor wretches could have

[*All Rights Reserved.*]

been murdered without a cry being heard was indeed a mystery. Apart from a fine church and a convent, it was but a poverty-stricken place, with the grass growing on the streets. As a matter of course, after we had sacked the two former, gaining thereby some very good silver plate and some vestments, the whole place was burnt to the ground. Still, this was a very small satisfaction. The horror of this murder filled the bravest with fear. Men dreaded to sleep; the same unseen foe might be near, and, in spite of the sentries being doubled and trebled, the same cruel fate might be theirs. This sort of thing was not war; it was downright devilry. However, the most horrible experiences fade away; and, although we began to recover our spirits, we never relaxed our vigilance.

We had got to a place called Londa, about four days' march of the frontier, when we were awakened one rainy night by the trumpets sounding *l'alerte* and the drums furiously beating *la générale;* and we found, in spite of all our precautions, three men had been stabbed just in the same way as before. This time they belonged to our regiment, and were in my own squadron. The mystery was, however, to a certain extent explained; for then it came out that just as the troopers had been going to rest in a barn, a burly fellow, with jovial, good-natured face, apparently a muleteer, came up with a skin full of wine. 'You may have it all for a peseta,' he said with a laugh, 'for I don't mind telling you I got it for nothing;' and then he commenced cracking jokes with them. The *maréchal des logis* ought to have sent the rogue about his business at once, or, better still, have detained him; but, as a matter of fact, completely taken in, the sergeant was one of the first to accept the fellow's fatal offer. 'It's a rough night, señors,' he said; 'surely you can find room for a poor fellow.' And the troopers, suspecting nothing, stupidly consented.

It chanced that the damp, stormy weather had given one of the men a raging toothache, which kept him awake. All was dark and still, when he heard a slight movement in the straw. He thought at first it was only a rat, and paid little attention to it; but suddenly he heard a slight struggle, a smothered groan, a gasp. 'What's that—who's there?' he cried, springing up. In a moment all was confusion. 'Few,' as Napoleon has said, 'have two o'clock in the morning courage,' and few appeared to have had it then.

Hearing the cries and commotion, the sentry without opened the door, and received a thrust from a dagger—but luckily not a fatal one, as it fell on his cross-belts—which sent him reeling, and in a moment the fellow had escaped in the darkness. When we entered the barn we found about a dozen men apparently dead; but on examination it was seen that they were only stupefied by the drugged wine which the rogue had given them. But for the trooper having that toothache, doubtless they too would have been murdered, and the assassin would have escaped, as at Medrussa. Of course, every one would have it that the dreaded Rico was the culprit, and curses were showered upon him; but whether he really was or not we never knew. As soon as it was light we compelled the natives to dig three graves for the poor fellows we had lost, and then, when they had done that, we hung six of them.

After the men had had their *café* all arms were paraded. We naturally thought then that we should receive orders to burn the village; but this was not Lavigny's present intention. I have said that he was of a merry, jovial disposition; but there was a peculiar hard look on his face as he ordered the men to stand at ease, and the field-officers to come to his quarters. The council was soon over, and then we learnt that the whole district for some leagues round was to be divided into three divisions, each arm of the service having their own portion to sack as much as they could in three days, and then return to Londa. That apportioned to us was to the south-west. Although I was continually thinking and wondering whether my father had been obliged to suspend payment, the idea that I could help him, even in a very small way, by getting some loot had not till then entered my head; but now I reckoned that I might be able to do a little to help him, and consequently no one entered with more zest into the pillaging expeditions than I. But, alas! Lavigny had taken very good care to keep the richest district for himself; and though we rode far and wide, on the first day we got little, and in no very happy frame of mind we took up our quarters that night at a place called Turela, and hoped for better luck on the next.

'There's a monastery, I see,' said Colonel Ferrières, producing a large theological book, 'about three leagues from here, called Santa Maria de la Piedad. Marvellous cures have, it appears, been worked there by the reliques they have got, and pilgrims leave thousands of pesetas behind them every year. It's the richest monastery in the district; and there is also another, Santa Maria del Pilar, where there are some very fine pictures, but it's rather farther off. We will try both, and start at four to-morrow.'

In high hopes of retrieving our fortunes, at the appointed time we set off; but, alas! we found, as regards the first monastery, that only the bare walls were standing, so we went on to Santa Maria del Pilar.

Just as we approached the building I saw a young fellow come out. He walked slowly, with a sad, dejected mien; and as we got near him he pressed his broad sombrero more over his eyes, and, going to a mule tethered under a tree, rode off. A very jovial young brother opened the door, and, though he must have guessed our errand, with a happy, confident smile he admitted us and went to fetch the prior. This latter had a very sleek, suave manner, and at once offered us what poor refreshment his monastery could give.

'Never mind that, reverend father,' said the colonel. 'Time is valuable. You have some fin

pictures, especially of the Italian school, and we have come for them.'

'We had,' he replied in a sorrowful voice, putting great emphasis on the word *had*; 'but, alas! the ungodly have deprived us of the offerings of the faithful, and may God judge them as they deserve! Come,' he continued, with the greatest apparent frankness, 'into our chapel, and judge for yourself.'

This news came as a great shock to us all, and with sad faces we followed him. 'There,' said the prior, 'you can see for yourself,' as he pointed to some of the most terrible, fresh-painted daubs we ever saw in our lives. 'These are the work of our young Brother Ambrose. They are copies of the originals which have been taken away from us; but God judges by the intention. Our brother has done his best; he can do no more.'

We looked at the wretched pictures, and we looked at each other. Some smiled—I did myself; I could not help it as I thought of our getting up at four in the morning and riding for hours for nothing—but most were more inclined to swear; in fact, the senior major suggested angrily that it would be a good thing to make a bonfire of them. At the word bonfire the prior's face turned white, and he held up his hands and begged us to leave him what little he had. But, as I thought of it afterwards, there was a touch of real anxiety in his voice which ought to have told us we were being fooled; but we were too angry for the most part to notice it. We went into the sacristy, but apart from a few vestments there was nothing worth having; and, turning on his heel and refusing any wine, the colonel told us it was not worth while wasting any more time, and we went straight back to the village.

Strolling down the little street, I suddenly saw, watering some flowers behind the bars of her window, a very handsome young woman. Wishing to get a better view of her, I crossed the road. Then I saw a young fellow standing by her; and, what was more, he was the same one whom I had seen leaving the monastery that morning. He had not got his hat now. I looked at him, and he looked at me, and our recognition was mutual. 'Marcourt!' 'Dangani!' we both cried in delight at once, and in another minute I was in the room.

But, so that you may understand our pleasure, I must go back a little. At the beginning of the campaign, three years before, I had been badly wounded in a skirmish near Barcelona. To beguile the time of my convalescence, I thought I would learn Spanish. I was told of a teacher, an Italian, Alexandro Dangani. To my surprise, I found he was an artist; but not having been able to make much by painting, and being very much in want of money, and able to speak German, French, and Spanish, he gave lessons in languages. He had a very refined, intellectual face, and withal a very taking manner; but constitutionally he was very delicate and timid. We soon became great friends, and gradually I learnt his history, and found out that he was not an Italian at all. He was born at Belfort, and his mother was German. He was naturally so weak and so timid that, rather than serve in the army, he fled to Genoa. Being of an amorous, sentimental disposition, he fell desperately in love with some girl there; but her family objected strongly to his suit—in fact, they threatened to kill him—and he, having no courage, sought refuge in Spain. In that country he dared not own he was French, as we French were so hated, so he passed as an Italian.

He painted landscapes, but as he made little by them I suggested that he should try painting portraits. We were now such friends that I told him of my betrothal, and he proposed that I should have my portrait painted to send to my fiancée, and he offered to do it for a hundred pesetas; but as I was as plain as a fellow could well be, I did not quite care for that. 'I will give you one hundred pesetas,' I said; 'but I won't let you paint my portrait.' 'Well, poor as I am, and much as I want money,' he answered, 'I am too proud to take money for nothing.' So, to help him, I let him do it. That portrait, he always said, made him. He did it so uncommonly well that I showed it to my comrades, and he got many commissions, and as his fame grew he got better prices. Amongst others he painted the wife of a rich merchant named Maldanez; then he painted her husband. This Maldanez had a very beautiful daughter named Christina, with whom Alexandro fell madly in love; and, what is more, his love was returned quite as ardently. Maldanez, who was a *nouveau riche*, would of course, had he known of it, never have allowed any communication between his daughter and a poor artist. Then Alexandro's natural timidity came in. The poor love-sick devil painted the portrait of his beloved Christina from memory, and consoled himself all day and half the night by gazing at it. I felt truly sorry, yet I had no patience with him. The girl, too, I fancy, was getting restive and angry, for she was warm-blooded and bold. But I had, when this stage had been reached, recovered from my wounds and joined my regiment, and had not seen or heard anything of him since.

'My dear Marcourt,' he said, after he had introduced his young wife, whose beauty was quite equal to the portrait I had seen of her, and told me of his elopement, which she herself had planned, and which was quite a story of itself, 'of all the fellows I am glad to see it is you. You can help me, and I am sure you will, for you are rich.' I told him that that was not the case now. 'Well, anyway,' he said, 'you have something.' Then closing the windows and the door, in a low voice, after he had made me promise that I would not divulge what he was going to tell, he said that he had four lovely pictures to sell, a Velasquez, one of the everlasting portraits of Philippe IV., a Botticelli, a Fillipo Lippo, and also a Juan Juanes.* 'Give me but two thousand

* Juan Vicente Juanes, who has been called the Spanish Raphael, was born in 1523, and died in 1579.

francs for them and they are yours.' Now, my father had always given me a large allowance. A captain 'on the strength' was allowed two horses, but I had kept five. However, I had lately sold three, as I knew in future I should have to retrench, so I had some ready money. '*Oh ciel!*' I exclaimed, and I thought of the money I could get for them to help my father, 'where are they?' To my astonishment, they were all daubed over just like those I had seen that very morning at the monastery. He quickly cleaned a portion of one, the Velasquez, and beneath I saw the real picture. Without any hesitation I drew out my purse and paid him. And then he told me everything.

Being at his wits' end to get money, he had painted some religious pictures. To prevent the parents of his bride tracing him, he had assumed the name of Cavalletti, and he had gone from monastery to monastery painting and restoring pictures for the monks, and thus he found his way to that of Santa Maria del Pilar. At the neighbouring monastery of Santa Maria de la Pietad, in revenge for their having taken their pictures away, Foy had burnt the whole building. Fearing the same fate might be his, the prior at Santa Maria del Pilar hit on the plan which had deceived our colonel that morning, and had, for the matter of that, deceived others. Dangani, it appeared, was the young Brother Ambrose we had heard of, who had given his poor talents to make up what the ungodly had taken. Fearing the French might appear on the scene while the real pictures were being done, he was ordered to daub them over down at Turela.

'Yes, they are all real,' continued Dangani in conclusion. 'The bulk of them are Italian, as the monastery was founded by one of the sons of Pope Alexander VI. The Velasquez was given them by Philippe IV., he having been taken ill when near the monastery, and he gave them his portrait as a memento of his recovery. The four pictures you have got are the finest of all. I have kept them back, because the prior promised to pay me as I went on, but I have never had a peseta yet. I tried again to get paid this morning, and although he really has thousands of pesetas in the treasury, he won't give me a duro, he says, till I have done all; but I know that once I give him back these he will laugh in my face. You show these pictures to your colonel, and say to him that if he will give me a thousand pesetas, and only take me and Christina out of this miserable country safely, I will tell him where to find some more like them.'

Willing to help the poor fellow, I promised to do this, and went off to my chief at once.

I found him playing piquet at peseta-points with three others. 'I have had a stroke of luck, *mon colonel*. I have got fine news for you.' And to his astonished and puzzled gaze I exhibited my four masterpieces.

'Why, these daubs are just like those we saw this morning at the monastery.'

'Of course they are,' I answered; 'but look at that;' and I pointed out where Alexandro had cleaned a bit of the Velasquez.

'*Ma foi!*' cried the colonel excitedly. 'Where is the fellow? Bring him here.'

Then I explained the conditions, and how timid he was, and how he feared to be seen talking to any Frenchman.

'He wants one thousand pesetas, does he? Well, he shall have a good deal more than that if the *coup* comes off. *Allons*, Marcourt, we will go and see him, as he is afraid to come and see us.'

'The money of the monastery,' said the painter, after I had introduced him and he had told the colonel all he had told me, 'is kept in a particular cell which is set apart for any brother who may be seriously ill. This cell is the only one that has got a bed in it, and the iron chest is below the tiles under the bed.'

The colonel was half-inclined to set off at once. But the men and horses were tired; so, taking one thing and another, he determined to wait till the morrow.

(*To be continued.*)

THE SECRET OF SUCCESS.

HOW many books, pamphlets, and articles have been written on the secret of success! How many lectures and addresses given to youthful aspirants! How many sign-posts set up to point out the way to weary pilgrims! Success, indeed, is perhaps the one single thing besides personal health upon which all men fix their eyes and set their affections. They may not all strive for it, but they all desire it. Everybody covets success, nobody covets failure; and yet, this notwithstanding, few subjects are shrouded in deeper darkness than the subject of success. The very questions we ask about it reveal ignorance rather than elicit information. Is success, we ask, a matter of luck or merit? Does it rest on the shifting sands of circumstance or on some solid rock of worth? Is it primarily a question of character or conditions? Is it open to all, or reserved only for the elect? Are some privileged and predestined from birth, or is it secured under free competition? We ask these and the like questions rather to relieve curiosity than to gain knowledge. We have no clear, no coherent ideas on the subject. For individual cases of success we find, no doubt, a ready explanation: this man's

industry, and that man's foresight, and another man's perseverance, and so on; but we have no theory, no fixed formula, no science of success. We can only explain it when achieved; we cannot guide or guarantee its achievement. Nor are our difficulties reduced by the secrets and subtleties inherent in the subject. To begin with, success is not easy to define. It is one of those words all the more difficult to define because so generally misunderstood. Like Proteus, it can assume an infinite variety of shapes. Again, success is estimated in various and often contradictory terms. There is no fixed standard, no general consensus of opinion on the subject. One man's meat is another man's poison, so success to one spells failure to another. In popular parlance, no doubt, it bears but one meaning—namely, success in making money or building up a business; but that is limiting the word to one sphere, whereas it enters into a hundred different spheres. The success, say, of Mr Rockefeller would be failure to Mr Evan Roberts. The success of a pork-butcher would be purgatory to a poet. Wolfe, as he rowed down the river St Lawrence to death and glory, quoted those exquisite lines from Gray's *Elegy*:

> The boast of heraldry, the pomp of pow'r,
> And all that beauty, all that wealth e'er gave,
> Await alike th' inevitable hour.
> The paths of glory lead but to the grave;

and said, 'I would rather have written those lines than capture Quebec.' Nevertheless, it is possible, I think, to frame a definition of success that will satisfy the popular mind. Success, we will suppose, means the attainment to a position of comfort, influence, wealth, honour, and respect; in a word, the realisation of our best choices and desires in life.

What is the secret of such success? One of the latest and best-equipped guides on the subject is the redoubtable Emil Reich, *Doctor Juris*, who comes to our help carrying a thick octavo volume in his hands, crying 'Eureka!' His book on *Success in Life* is undoubtedly a most interesting, improving, and valuable *vade mecum*. It is full of out-of-the-way learning, shrewd comments on men and things, perky playfulness, and that peculiar kind of humour which we associate with savants and learned professors. He approaches the subject with a confidence that is sure to be contagious and inspire his readers with courage and hope. He removes from the subject all romance and mystery by explaining its rationale, as a peep behind the scenes robs the pantomime of its illusive spell. He puts aside luck and chance as determining factors, and, as if to establish his theories upon a scientific basis, christens the subject with a new name, 'Energetics.' Like everything that Dr Reich handles, whether Platonic love before an aristocratic audience at Claridge's or a skirmish on teetotalism with plebeians in the press, his treatment has all the charm of novelty and freshness, though even his acute intellect does not altogether escape current fallacies and delusions.

Let us, to begin with, deal with some of these delusions on the subject. One of the commonest is the all but universal assumption that success can be achieved if men will only seriously try for it. Prize-day addresses and certain modern books bubble over with this theory. It is a great incentive and stimulus, no doubt, to ambitious youth. Of course, some will not try for it. They desire success, but do not choose it, which is very different. They wish it, but will not work for it. It makes too great a demand on their love of ease and content. Like Agrippa, they are 'almost persuaded;' but the pull of pleasure proves too much.

But even in the case of those who really strive for it, can we say that success is always certain or possible? We cannot. Otherwise, the failure of many a heaven-born genius would be inexplicable. Most of us have known men who were martyrs to success. They fought for it and fell; success slew them. They pursued it to the end, and at last it eluded their grasp. They died defeated. The road of life is red with the blood and stained with the tears of ill-fated travellers such as these. There may be a key to unlock the mystery of such tragic lives, but certainly the theory that success is due to steadfast purpose and honest endeavour does not put it in our hands.

Another delusion, and one perhaps that as a nation we put pathetic faith in, is our infinite credence in the possibilities of education. Education may be, and undoubtedly is, an instrument of success; but it is by no means an indispensable instrument. One of the many disregarded commonplaces of history is the fact that in countless cases success has been won by so-called uneducated men. Indeed, it might be plausibly contended that the highest success in nearly all departments of life has been achieved by men of this type. Take literature, for example. We have notable examples like Bunyan, Burns, Dickens, and Shakespeare. What stars shine brighter in the whole galaxy of genius than these? Take war, politics, invention, and the sphere of public affairs. What greater names can be brought forward than those of Napoleon, Marlborough, Nelson, Franklin, Abraham Lincoln, Stephenson, Cecil Rhodes, and Benjamin Disraeli? Yet it is doubtful if one of these great men could have passed the London 'matric.' But they graduated in the greater school of life with highest honours, and the reason was this: they possessed one thing in common which cannot be found in the curriculum of the schools—namely, authority, the power of compelling belief, of arresting attention, the power of bringing the world to their knees in wondrous worship. That something is the secret of success. There is something in real greatness towards which men must gravitate. It is not knowledge or industry or brilliant gifts. It is the secret of personality—subtle, mysterious, indefinable, incommunicable—a gift of the gods. 'Knowledge,'

we are told, 'is power;' and so it is when it can be used; otherwise it is a useless encumbrance, and adds nothing to impotence. A man can do more with twopence in his pocket than with millions to his credit in the bank which he cannot touch.

Yet another common delusion is the theory that success is best achieved by careful regard to that consensus of opinion which we call common-sense. Nothing could be farther from the truth. On the contrary, success, especially in large and majestic measures, is often promoted by the emphatic and persistent disregard of what we call common-sense. So true is this, that success, like genius, may be said to border on insanity. The author of *The Savoir-Vivre Papers* justly remarks that 'men will become enamoured of some enterprise which infallibly impresses the average common-sense person as a mad and hopeless enterprise. The average common-sense person will demolish the hopes of that enterprise by incontrovertible argument. He will point out that it is foolish on the face of it, that it has never been attempted before, and that it responds to no need of humanity. He will say to himself, "This fellow, with his precious enterprise, has a twist in his brain. He can't reply to my arguments, and yet he obstinately persists in going on." And the man destined to success does go on. Perhaps the enterprise fails—it often fails; and then the average common-sense person expends much breath in "I told you so's." . . . One day some enterprise foredoomed to failure develops into a success. We all hear of it. We all open our mouths and gape.' Successful authorship, successful invention and discovery, have again and again been won by the resolute rejection of all company and counsel. This is what Dr Reich means, no doubt, when he points to the superior achievements of the 'foreigner' over the native; his independence and separation are real factors in his greater success. In fact, the basic idea of success is differentiation from the crowd. Great travellers never keep to the beaten track.

Much perplexity lingers as to the part played by chance in the successes and failures of life. Some, like Dr Reich, rule it out altogether; some pay it superstitious regard. The truth seems to lie midway between these extremes. We are the victims of chance on the one hand, and a kind of predestination on the other. Perhaps these are fundamentally one. The hazards of the gaming-table illustrate the one, and Shakespeare's lines, 'There's a divinity that shapes our ends, rough-hew them as we will,' the other. A man goes to Monte Carlo and decides to back red for the maximum at the roulette-table, and red turns up. What is responsible for his success but chance? So in the larger gambles of life red often turns up for some people, and we call them lucky. But by chance we must understand not only the uncertain operations of the roulette-table, but the collective expression of all circumstances favourable to success not due to any inherent merit of our own. Talleyrand called back a candidate for office, whom he had previously dismissed, through seeing him pick up a pin as he retired from the room. 'You are a thrifty fellow,' said the diplomatist, 'and I will keep you.' The man's thrift was meritorious, but the presence of a pin on the floor was the merest accident. If there had been no pin the man would have failed. How often life turns on accidents like that! The man who holds the trump-cards wins, and Chance shuffles the cards and deals them out to the players. Much of Napoleon's marvellous success during his earlier triumphs was due to sheer good-luck. Let us say what we will about his phenomenal genius, his titanic energy, his colossal ambition; we cannot ignore the presence of his 'star.' Failure can never befall us if the stars in their courses fight against our enemies.

Yet there are prudential measures that we do well to consider. Of these, of primary importance is the question of finding and maintaining our right position in life. Some men fail because they aim above their powers, some because they aim below; in both cases failure is due to bad strategy. People quote their Shakespeare complacently:

> There is a tide in the affairs of men
> Which, taken at the flood, leads on to fortune;

but forget that the tide can never be 'taken' by the man who is found out of its reach. The tide never touches the poet who ought to be packing sugar, or the man behind the counter who ought to be writing books. The misfits and misplaces of life are responsible for innumerable failures. Thackeray failed as a journalist; as a novelist he sprang into instant celebrity. Byron belied his youthful fancy to be a second William Pitt, but after writing *Childe Harold* 'he awoke one morning and found himself famous.' Mr Rufus Isaacs was unknown as a stockbroker; when he entered the Bar his name became world-wide. Why? The tide could be 'taken' there; and he had the ability to make the most of it. Dr Reich tells us that every man has one line of success at his command, and that victory is really a matter of good strategy—taking up the right position; and probably this is true. No parental responsibility is more serious than the duty of directing young people into the right line of life. The misery of men misplaced is tragic—tragic in its hopelessness and despair. No other consolation can ever compensate for that.

Dr Reich concludes his book on *Success in Life* with the terse and truthful remark: 'The science of success, then, is the study of the origin, growth, and application of the greatest power of practical life-authority.' That is perhaps as near as we can get to the ultimate secret. The successful man is always Master, Master of men and things, Master of practical life; he possesses that indefinable power of personality which is everywhere recognised, and which everywhere rules.

We conclude, then, as we commenced, by again emphasising the secrets and subtleties of the subject

There is no method of making the path of success so plain that the wayfaring man, though a fool, shall not err therein. There is no rule of life that will guarantee success. There must always remain a certain element of hazard, a certain spice of speculation. Determination cannot decide destiny. A man may make a bold fight against fate, but he cannot be sure of winning, just as a vessel may ride the roughest seas and yet founder on sunken reefs. All we can say is this: Let the aspirant prepare himself for the contest; let him be strong where the enemy is weak; let him take a brave heart into the battle, remembering, with Arthur Helps, 'that we always think the clouds to be higher than they are until we see them resting on the hills.' Having made victory as sure as mortals can in this uncertain world, let him trust that the gods will be gracious, especially Tyche, the goddess of fortune, and crown his efforts with abundant success.

THE HOUSE OF WHISPERS.*

By WILLIAM LE QUEUX.

CHAPTER XL—CONCERNS THE WHISPERS.

WHAT had startled Gabrielle was certainly extraordinary and decidedly uncanny. She was standing near the southern wall, when, of a sudden, she heard low but distinct whispers. Again she listened. Yes. The sounds were not due to her excited imagination at the recollection of those romantic traditions of love and hatred, or of those gruesome stories of how the Wolf of Badenoch had been kept prisoner there for five years and put to frightful tortures, or how the Laird of Weem was deliberately poisoned in that old banqueting-hall, the huge open fireplace of which still existed near where she stood.

There was the distinct sound of low, whispered words! She held her breath to listen. She tried to distinguish what the words were, but in vain. Then she endeavoured to determine whence they emanated, but was unable to do so. Again they sounded—again—and yet again. Then there was another voice, still low, still whispering, but not quite so deep as the first. It sounded like a woman's.

Local tradition had it that the place held the ghosts of those who had died in agony within its noisome dungeons; but she had always been far too matter-of-fact to accept stories of the supernatural. Yet at that moment her ears did not deceive her. That pile of grim, gaunt ruins was a House of Whispers!

Again she listened, never moving a muscle. An owl hooted weirdly in the ivy far above her, while near, at her feet, a rabbit scuttled away through the grass. Such noises she was used to. She knew every night-sound of the country-side; for when she had finished her work in the library she often went, unknown to the household, with Stewart upon his nocturnal rounds, and walked miles through the woods in the night. The gray-eyed, thin-nosed head-keeper was her particular favourite. He knew so much of natural history, and he taught her all he knew. She could distinguish the cries of birds in the night, and could tell by certain sounds made by them, as they were disturbed, that no other intruders were in the vicinity. But that weird whispering, coming as it did from an undiscovered source, was inhuman and utterly uncanny.

Was it possible that her ears had deceived her? Was it one of the omens believed in by the superstitious? The wall whence the voices appeared to emanate was, she knew, about seven feet thick—an outer wall of the old keep. She was aware of this because in one of the folio tomes in the library was a picture of the castle as it appeared in 1510, taken from some manuscript of that period preserved in the British Museum. She, who had explored the ruins dozens of times, knew well that at the point where she was standing there could be no place of concealment. Beyond that wall, the hill, covered with bushes and brushwood, descended sheer for three hundred feet or so to the bottom of the glen. Had the voices sounded from one or other of the half-choked chambers which remained more or less intact she would not have been so puzzled; but, as it was, the weird whisperings seemed to come forth from space. Sometimes they sounded so low that she could scarcely hear them; at others they were so loud that she could almost distinguish the words uttered by the unseen. Was it merely a phenomenon caused by the wind blowing through some crack in the ponderous lichen-covered wall?

She looked beyond at the great dark yew, the justice-tree of the Grahams. The night was perfectly calm. Not a leaf stirred either upon that or upon the other trees. The ivy, high above and exposed to the slightest breath of a breeze, was motionless; only the going and coming of the night-birds moved it. No. She decided once and for all that the noise was that of voices, spectral voices though they might be.

Again she strained her eyes, when still again those soft, sibilant whisperings sounded weird and quite inexplicable.

* Copyright in the United States of America by the Authors' and Newspapers' Association, New York, 1908.

Slowly, and with greatest caution, she moved along beneath the wall, but as she did so she seemed to recede from the sound. So back she went to the spot where she had previously stood, and there again remained listening.

There were two distinct voices; at least that was the conclusion at which she arrived after nearly a quarter of an hour of most minute investigation.

Once she fancied, in her excitement, that away in the farther corner of the ruined courtyard she saw a slowly moving form like a thin column of mist. Was it the Lady of Glencardine—the apparition of the hapless Lady Jane Glencardine? But on closer inspection she decided that it was merely due to her own distorted imagination, and dismissed it from her mind.

Those low, curious whisperings alone puzzled her. They were certainly not sounds that could be made by any rodents within the walls, because they were voices, distinctly and indisputably *voices*, which at some moments were raised in argument, and then fell away into sounds of indistinct murmuring. Whence did they come? She again moved noiselessly from place to place, at length deciding that only at one point—the point where she had first stood—could the sounds be heard distinctly. So to that spot once more the girl returned, standing there like a statue, her ears strained for every sound, waiting and wondering. But the Whispers had now ceased. In the distance the stable-clock chimed two. Yet she remained at her post, determined to solve the mystery, and not in the least afraid of those weird stories which the country-folk in the Highlands so entirely believed. No ghost, of whatever form, could frighten her, she told herself. She had never believed in omens or superstitions, and she steeled herself not to believe in them now. So she remained there in patience, seeking some natural solution of the extraordinary enigma.

But though she waited until the chimes rang out three o'clock and the moon was going down, she heard no other sound. The Whispers had suddenly ended, and the silence of those gaunt, frowning old walls was undisturbed. A slight wind had now sprung up, sweeping across the hills, and causing her to feel chill. Therefore, at last, she was reluctantly compelled to quit her post of observation, and retrace her steps by the rough byroad to the house, entering by one of the windows of the morning-room, of which the burglar-alarm was broken, and which on many occasions she had unfastened after her nocturnal rambles with Stewart. Indeed, concealed under the walls she kept an old rusted table-knife, and by its aid it was her habit to push back the catch and so gain entrance, after reconcealing the knife for use on a future occasion.

On reaching her own room she stood for a few moments reflecting deeply upon her remarkable and inexplicable discovery. Had the story of those whisperings been told to her she would certainly have scouted them; but she had heard them with her own ears, and was certain that she had not been deceived. It was a mystery, absolute and complete; and, regarding it as such, she retired to bed.

But her thoughts were very naturally full of the weird story told of the dead and gone owners of Glencardine. She recollected that horrible story of the Ghaist of Manse and of the spectre of Bridgend. In the library she had, a year ago, discovered a strange old book—one which sixty years before had been in universal circulation—entitled *Satan's Invisible World Discovered*, and she had read it from beginning to end. This book had, perhaps, more influence upon the simple-minded country-people in Scotland than any other work. It consisted entirely of relations of ghosts of murdered persons, witches, warlocks, and fairies; and as it was read as an indoor amusement in the presence of children, and followed up by unfounded tales of the same description, the youngsters were afraid to turn round in case they might be grasped by the Old One. So strong, indeed, became this impression that even grown-up people would not venture, through fear, into another room or down a stair after nightfall.

Her experience in the old castle had, to say the least, been remarkable. Those weird whisperings were extraordinary. For hours she lay reflecting upon the many traditions of the old place, some recorded in the historic notices of the House of the Montrose, and others which had gathered from local sources—the farmers of the neighbourhood, the keepers, and servants. Those noises in the night were entirely mysterious and puzzling.

Next morning she went alone to the kennels to find Stewart and to question him. He had told her many weird stories and traditions of the old place, and it struck her that he might be able to furnish her with some information regarding her strange discovery. Had any one else heard those Whispers besides herself? she wondered.

She met several of the guests, but assiduously avoided them, until at last she saw the thin, long-legged keeper going towards his cottage with Dash, the faithful old spaniel, at his heels.

When she hailed him he touched his cap respectfully, changed his gun to his other arm, and wished her 'Guid-mornin', Miss Gabrielle,' in his strong Scotch accent.

She bade him put down his gun and walk with her up the hill towards the ruins.

'Look here, Stewart,' she commanded in a confidential tone, 'I'm going to take you into my confidence. I know I can trust you with a secret.'

'Ye may, miss,' replied the keen-eyed Scot. 'I houp Sir Henry trusts me as a faithfu' servant. I've been on Glencardine estate noo, miss, thae forty year.'

'Stewart, we all know you are faithful, and that you can keep your tongue still. What I'm about to tell you is in strictest confidence. Not even my father knows it.'

'Ah! then it's a secret e'en frae the laird, eh?'

'Yes,' she replied. 'I want you to come up to the old castle with me,' pointing to the great ruined pile standing boldly in the summer sunlight, 'and I want you to tell me all you know. I've had a very uncanny experience there.'

'What, miss!' exclaimed the man, halting and looking her seriously in the face; 'ha'e ye seen the ghaist?'

'No, I haven't seen any ghost,' replied the girl; 'but last night I heard most extraordinary sounds, as though people were within the old walls.'

'Guid sake, miss! an' ha'e ye actually h'ard the Whispers?' he gasped.

'Then other people have heard them, eh?' inquired the girl quickly. 'Tell me all you know about the matter, Stewart.'

'A'?' he said, slowly shaking his head. 'I ken but a wee bittie aboot the noises.'

'Who has heard them besides myself?'

'Maxwell o' Tullichuil's girl. She said she h'ard the Whispers ae nicht aboot a year syne. They're a bad omen, miss, for the lassie deed sudden a fortnicht later.'

'Did any one else hear them?'

'Auld Willie Buchan, wha lived doon in Auchterarder village, declared that ae nicht, while poachin' for rabbits, he h'ard the voices. He telt the doctor sae when he lay in bed a-deein' aboot three weeks aifterwards. Ay, miss, I'm sair sorry ye've h'ard the Whispers.'

'Then they're regarded as a bad omen to those who overhear them?' she remarked.

'That's sae. There's bin ithers wha acted as eavesdroppers, an' they a' deed very sune aifterwards. There was Jean Kirkwood an' Geordie Menteith. The latter was a young keeper I had here aboot a year syne. He cam' tae me ae mornin' an' said that while lyin' up for poachers the nicht afore, he distinc'ly h'ard the Whispers. Kennin' what folk say aboot the owerhearin' o' them bein' fatal, I lauched at 'im an' told 'im no' to tak' ony tent o' auld wives' gossip. But, miss, sure enough, within a week he got blood-pizinin', an', though they took 'im to the hospital in Perth, he deed.'

'Then popular superstition points to the fact that any one who accidentally acts as eavesdropper is doomed to death, eh? A very nice outlook for me!' she remarked.

'Oh, Miss Gabrielle!' exclaimed the man, greatly concerned, 'dinna treat the maitter lichtly, I beg o' ye. I did, wi' puir Menteith, an' he deed juist like the ithers.'

'But what does it all mean?' asked the daughter of the house in a calm, matter-of-fact voice. She knew well that Stewart was just as superstitious as any of his class, for some of the stories he had told her had been most fearful and wonderful elaborations of historical fact.

'It means, I'm fear'd, miss,' he replied, 'that the Whispers which come frae naewhere are forewarnin's o' daith.'

(To be continued.)

THE NEW CANADIANS;

OR, THE PROCESS OF CANADIANISATION.

OFFICIAL statistics for the last departmental year show that in this period more than two hundred thousand immigrants entered the Dominion of Canada. Almost half of this number came from the British Isles, and between forty and fifty thousand from the United States; but, in addition to these Anglo-Saxon contingents, there was a large element of incomers drawn from every country in Europe. This stream of Continental immigration is increasing in volume every year, and it is also a fact that many of the settlers from south of the line are of foreign birth or extraction, large numbers of them being Scandinavians. Port Said, the Gateway of the East, has long been regarded as the most cosmopolitan city in the universe; but Winnipeg, the Gateway of the West, bids fair to rob the Suez Canal port of her ancient prestige. It is doubtful if even the thoroughfares at Port Said can show a more motley mixture of nationalities than the Canadian Pacific depôt after the arrival of one of the great immigrant trains. Men throng to Winnipeg in a polyglot stream, speaking half a hundred tongues and habited as variously as if they were denizens of different planets: the Briton, in his many varied types; the German, neatly dressed and bearing the hall-mark of military service; the Galician or Polish family, cheerful and numerous, with their worldly wealth contained in several crude sacks; the flaxen-haired, blue-eyed Scandinavian; the swarthy Italian, dreaming of a restaurant to be; Hebrews from Russia, with a hunted air; and a talkative assortment of Yankees—all these can be seen any day in the spacious Canadian Pacific Railway waiting-hall.

The new arrivals are interesting in themselves, but an even more engrossing study is the process of their assimilation by the Anglo-Saxon race, and in particular by the Canadian nation. Many people are very sceptical about the possibilities of transforming Galicians and other foreigners into Canadians and good citizens of the British Empire; but the rapidity with which most of the races

acquire at least the outward characteristics of the Canadian is little short of marvellous. Daily experience in one of the largest law-offices in the city of Winnipeg brings one in contact with many varied clients, and affords ample opportunity of studying the various types of the community.

The people of Scandinavian stock, especially the Swedes and Icelanders, of whom there are large numbers in the city and in the Gimli district near Lake Manitoba, are perhaps the most adaptable of all, and dress like natives after the first month. The Scandinavians are invariably smart linguists, and though on arriving they may not be able to speak a word of English, they master the new tongue in a few months, and can in that time understand and appreciate a sermon in it. Swedes who have been in the country several years often like to forget their nationality. We remember one worthy settler, whose name had the Viking ring of Thorgeirson about it, cheerfully telling us that he had sold certain property to 'a dam old Swede.' One of the leading barristers in Winnipeg is a native of Iceland, and at least two of the provincial members of Parliament are of the same stock. The Germans, of whom it is estimated there are ten thousand in the city, are not so quick to adopt the ways of the new society, and a probable cause of this is the disciplinary instinct derived from militarism, which checks a tendency to innovation. They are mostly skilled artisans, and their industry and thrift soon put them in a position to establish businesses and little workshops of their own. They are also extremely keen on good education, and it is a convincing fact that at the close of last session at Manitoba University many of the chief prize-winners were Germans, or at least had German names. Their Lutheran Church is in a very flourishing condition; but many of them belong to the Baptist denomination. There is no actual German quarter, and they are liberally dispersed all over the city. An old-timer tells how he once could discover German homes. He used to walk the roads in the evenings, and if he heard good music coming from a house he knew that its owners as often as not hailed from the Fatherland.

It is customary in the West to classify the various contingents which come from east-central Europe as Galicians. The first batch of Continental immigrants and many subsequent parties certainly came from Galicia, the Polish province of Austria; but very many who are described by that name are in reality Poles, Ruthenians, Lithuanians, or of some other Slavonic race. Ever since the final partition of Poland among the neighbouring Great Powers there has been a constant stream of emigration to America to escape the hated alien rule, and Canada is now welcoming large numbers from that region. They are a hardy, industrious race, and are probably the finest navvies in the world; the railways and roads of Canada are now to a great extent created by the Galician. Accustomed as they are to militarism and a semi-feudal domination, they are not a high-spirited race, and are generally ignorant and badly educated. The wage-scale in Canada seems untold wealth to people from impoverished Austrian Poland, and the older generation usually devote themselves solidly to the task of garnering dollars. They may learn to speak a little English, but they seldom learn to read it. It is otherwise, however, with the children; in the country the men will stay out on their homesteads in the winter, while the women come into the nearest town, fix up a small 'shack' with a stove in it, and work hard washing and charing to keep up two establishments and enable their children to attend school. The second generation of Galicians can talk and swear exactly after the manner of native-born Westerners, and they acquire the dress and characteristics of the country. Galician girls are rapidly turned into good, efficient servants; but they have an awkward habit of marrying and leaving without notice. The usual sign of impending matrimony which warns the mistress is a two days' fit of weeping before the actual departure. They are a quiet, peaceable folk, except at weddings and funerals, when they are apt to get very drunk; to these functions beer is carried in pailfuls, and a hall is always hired for a dance. But the festivities often end in a free fight, and blood is frequently spilt, with the result that next morning the police-court docket contains a long list of weird, unpronounceable names. The women have a strong penchant for gaudy colours, particularly blue, and they are a strange sight in the streets of modern Winnipeg with their variegated kerchiefs. Their homes in the north end of the city are for the most part scrupulously clean, and the owners sometimes even extend their scrubbing energies to the wooden side-walks. Among themselves nothing but their own tongue is used, and many of their ancestral customs are preserved; but the children go to the Government schools, and become bilingual in a short time. One Galician father once remarked, pointing to his offspring, 'Me and mother Galicians, but we're raising Canadians.'

Italians, are more commonly known as 'Dagoes' (a term applied in America to the Latin races), and are generously distributed throughout all Canadian cities. They concentrate their energies on the fruit-trade and restaurant business; and in Winnipeg at least half the business people lunch in 'Dago' restaurants. They have a peculiar adaptability for this business, and seem to manage to run their places more economically and better than the local caterers. Many of them have retired with large fortunes. The Mariaggi was—and in fact still is—one of the best hotels in the city, and its founder has returned to his native Corsica with an ample competence. The Italian differs from other European settlers in that he is always anxious to return to the sunny skies of his native land; his temperament is artistic, and the West will always be to the native of Florence a rough, crude country.

On this account he is possibly not so satisfactory an immigrant as others, for he only adapts himself to suit business necessities, and takes money out of the country; but, on the other hand, there is no doubt he helps to increase the comfort of life.

If the 'Dagoes' specialise in one line, the Chinaman monopolises another—namely, the laundry business, and does the work well. His methods, it is said, ought not to be too closely investigated; but the results are as satisfactory as those of the steam laundries, and the cost is less. The Chinese are most obliging and honest, and their industry puts most white men to shame. But they absolutely fail to assimilate; they keep to themselves, and return in due course, if funds permit, to their native land. There is a certain amount of missionary work carried on amongst them; but their vices are few. Their one besetting passion is gambling, fantan being the name of their favourite game. They will never intermingle or marry with the white race, though we have heard of one instance of a Chinese cook proposing to a newly arrived English housemaid. He was refused, and wept steadily for two days, and would not be comforted; but his case is probably unique. Chinese half-breeds are practically unknown in America, and the problem of the yellow races' encroachment on white territory still awaits solution.

There is, as in every place, a large Jewish element, and, as usual, it is exceedingly prosperous. They hail from every country, but the largest numbers come from Russia, flying from the reign of terror. Their cleverness is most extraordinary, and they are a race of born traders; though they engage in almost every calling, they are chiefly to be found in the cheap clothes business or dealing in second-hand goods. They readily adapt themselves to their environment, and in many cases have half-a-dozen tongues available, which gives them a great advantage in a cosmopolitan city. While they retain their religion and rites, they become Canadians in every other respect; but it must be admitted that they are no more popular as a class than elsewhere.

Such are a few of the types of Canada's new citizens, but there are representatives from the tiniest Balkan principality. There are also, for instance, a certain number of Syrian pedlars, mostly in Ontario, and one gentleman who lately appeared in the local courts gave Constantinople as his birthplace. As a reminder of the past, there is a considerable half-breed population in the West, and, in fact, most of the old-timers have Indian blood in their veins; many of them are of Scotch descent, but their language is French, and it is very amusing to find a dusky maiden with the fine Highland name of Flora Macdougall lisping in Gallic patois instead of Gaelic. There are several quaint half-breed villages on the outskirts of Winnipeg itself, whose inhabitants lead a dirty, primitive existence, undisturbed by the material progress of the country; they are bad farmers, and mostly thriftless, but in the north they are peerless as guides and canoemen.

It will now be patent to the reader what diversified elements have been brought together for the upbuilding of the new-born Canadian nation, and how difficult the task of consolidation and assimilation must be. In nationalising these varied elements the schools are doing splendid work, though the much-vaunted system of Canadian education is not worthy of the laudations heaped upon it. It looks well on paper, but fails often in its results; it attempts too wide a range of subjects to give an efficient training in any one, and on the whole is not nearly so sound as the Scottish system. But the authorities have shown a vigorous and intelligent attitude in grappling with the problem of the education of foreigners. They ought, however, to make education compulsory for all in the western provinces; in the old days the long distances and other prevailing conditions rendered this almost impossible, but there is no excuse for laxity now. There must be large numbers of foreign children running wild both in the cities and country districts. In Winnipeg the Galician community tackled this problem themselves, and an inspector of their own race, an intelligent man and a good linguist, was appointed to look after such truants. When one school, the Strathcona, was opened, the scholars spoke twenty-three different languages; but in six months every tiny tot could make himself understood in English, and they were all playing together in the playground. The Government have also attempted to promote the education of the foreign element in another way; they have provided means for training Galicians, Ruthenians, and others as teachers, who will in turn be able to educate their own compatriots. This scheme is only in its infancy, but its present success will lead to its extensive development, and the immigrant from non-English countries will have the opportunity of receiving an English education from teachers of his own race. There seems, at any rate, to be no difficulty in securing would-be teachers for the task. The intention is to teach the children as much as possible about the history of the British Empire and British institutions, and make them feel themselves associated with the past of the Empire rather than that of the land of their fathers. For performing this task and manufacturing good citizens nothing can be so efficacious as good schools, and we believe that the future of Canada as a nation lies in her educational system.

THE THREEFOLD VICTORY IN ROSLIN GLEN.

A NEGLECTED PAGE OF SCOTTISH HISTORY.

By E. BRUCE LOW, M.A., F.S.A.(Scot).

PART I.

On Roslin all that dreary night
A wondrous blaze was seen to gleam;
'Twas broader than the watchfire-light,
And redder than the bright moonbeam.
It glowed on Roslin's castled rock,
It reddened all the copsewood glen,
'Twas seen from Dryden's groves of oak,
And seen from caverned Hawthornden.
SIR WALTER SCOTT.

AMONG the multitude of American, English, and Scottish tourists who every summer visit 'Roslin's castled rock,' and admire the marvellous skill which produced the 'Prentice Pillar in the neighbouring chapel, there are few who wend their way to the little cemetery, where stand two isolated buttresses of stone, the sole remains of the original Chapel of St Matthew, erected seven hundred years ago by the good Saintclair of 'Roskelyn,' as it was then called. The name means 'the headland of the wood beside the stream' (*ros coil lyn*), and it well describes the site of this first chapel devoted to commemorate the threefold victory gained on St Matthew's Day, February 1303, by a comparatively small force of patriotic countrymen over a well-armed body of invaders from England three times their number.*

This great achievement in the long War of Independence has been overshadowed by the crowning victory of Bannockburn, which brought the stubborn struggle in Scotland to a close. There is, however, good reason for keeping in living memory this fierce contest, as it served to throw a gleam of hope into the hearts of the patriots, who (since the defeat of Wallace at Falkirk in 1298, followed by his renunciation of the office of Governor of Scotland, and the submission of many of the jealous Scots nobility to the rule of King Edward) had been left to continue the struggle, but had been unable to keep an army in the field. The truce which the English king had deemed it convenient to make with the Scots while he conducted his more anxious struggle against the French king terminated on St Andrew's Day, November 1302, and King Edward found himself compelled to issue writs to summon twenty-six of his feudal barons of the north of England to assemble on the Borders with the view of making a raid into Scotland, so as to support the authority of Sir John Segrave, the Governor for King Edward, and to overawe the people, who already were showing signs of unrest. Under the command of Ralph de Manton, called the Cofferer (or Paymaster) of the Army—whom the Scots chronicler Fordun describes as 'a magnanimous man, noble exceedingly, brave in arms and wise in counsel'—this army of thirty thousand soldiers, for the most part cavalry, marched unopposed into Midlothian, where three divisions were formed in order to facilitate the victualling of the force. Hector Boece tells us that the whole country was apparently subject to the English power, 'saving such few of the inhabitants as lived within the woods, having more regard to the ancient liberties of the country than any desire of preserving their goods or lives.' From Berwick to Edinburgh it was, indeed, difficult to find sustenance for such an army, as 'the farms were deserted, the labourers had either fled or were murdered, and there being no one to till the ground, the fairest part of Scotland was turned into a wilderness, overgrown with briars and thickets' (Buckle, iii. 16).

The Scots had appointed John Comyn, Earl of Buchan, best known as the Red Comyn, to be their Governor, and he had invited Sir Simon Fraser of Biggar, ancestor of the family of Lovat, and known in Scots history as the 'Flower of Chivalry,'† to join him in a supreme effort 'to redress the heavy misery and lamentable case of his country.' Simon Fraser had earned a high name among the knights of the English and French Courts by his valour in the wars in Flanders; but being defrauded of his promised reward by, as he believed, Sir Ralph de Manton, he gladly threw in his lot with the Red Comyn in one more attempt to free their country. The assertion that Sir William Wallace accompanied these leaders in this expedition may be dismissed as without confirmation in the contemporary accounts. Mustering as many men as possible from the forests and hills of the south and west behind the screen of the Pentlands, the commanders appointed Biggar as the rallying-point, and determined, by the bold stroke of a midnight march, to fall upon the now divided forces of the enemy before they could prepare for defence. Hemingford says the English leaders 'were without apprehension, not knowing the ambuscades of the Scots.' To the number of eight thousand men, for the most part on foot, the patriots set off from the Upper Ward of Lanarkshire across the flank of the Pentland Hills, and in the gray dawn descended towards the sleeping camp of the English Governor, who commanded a division of nearly ten thousand soldiers, mainly horsemen. It so happened that a lad belonging to Segrave's

* Father Hay, in his *Genealogie of the Saintclairs of Rosslyn*, tells us that here was erected in memory of one of the English leaders, 'by a lady who entirely loved him, a cross of stone, which at that time was all gilded over.'

† Where's Somerville, the kind and free,
And Fraser, flower of chivalry?—SIR W. SCOTT.

force had strayed that morning to the banks of the Bilston Burn for water, and through the silver mist descried several horsemen approaching, while behind them appeared, across the moor, long lines of footmen. The English camp occupied the rising moorland, now as then partly wooded, which adjoins on the east the road which runs from Bilston to Roslin. Speeding his way in alarm to arouse his compatriots, he was yet unable to reach the tent of the commander before the Scots, thundering at his heels, broke into the camp and very soon put an end to the irregular defence offered by a few isolated and ill-armed parties of Englishmen. Sir John Segrave himself, his son, and his brother were captured in their tents 'als thei woke,' as Langtoft says. With them were taken sixteen other knights and thirty sergeants or esquires.

Sir John was severely wounded ere he surrendered. He is well known as a prominent figure in the history of his times. Succeeding as second Baron in 1295, at the age of thirty-nine, he had led a part of the advance guard to victory at Falkirk in 1298, when his brother Nicolas, Baron of Stowe, also held command; and in 1300 his standard (*sable*, a lion rampant *argent*, crowned *or*) had waved in triumph over the walls of Caerlaverock, the castle of Sir Herbert Maxwell, head of the Border clan. The misfortune which now befell him at Roslin was repeated at Bannockburn eleven years later, and he was kept a prisoner in Stirling Castle, as the Ashmole Manuscript in the Bodleian Library tells us, '*sub custodia Roberti de Bruse.*' Ere this later misfortune, Sir John had taken a leading part at the mock trial and execution of Sir William Wallace in 1305, being specially mentioned in the ancient chronicles as having ridden at the head of that sad procession from the house of William Delect, in Fenchurch Street, where Wallace was lodged, to the Great Hall at Westminster. Crowned in derision with laurel, the noble prisoner was brought before Sir Peter Malorie, the King's Justice, where, denying any act of treason to the English king, whose subject he never was, he was convicted and summarily beheaded and quartered; and there is ample evidence in the accounts of payments made to Sir John Segrave that it was he who carried out the awful work of distributing the limbs of the great Liberator among the various cities where it was thought advisable that a warning to all the Scots patriots should be given. Sir John survived till 1325, when he had reached his seventieth year.

The surprise of the English camp was complete, and many fugitives fled in the direction of the second division, which had been posted near Gilmerton, but was under orders to rendezvous at Roslin. The remainder of Segrave's advanced force, unable to close their ranks, gradually ceased their resistance, and the Scots found themselves at all points masters of the field and in possession of the whole equipment, horses, and stores of the vanguard. Rejoicing at their rapid conquest, the Scots leaders prepared to enjoy a well-earned rest after the fatigues of the long night-march of twenty-five miles over the hills, and the exertions of the morning combat. Many of the Scots spread themselves through the tents seeking booty, others collected the horses and arms of the fallen, and a force was told off to prepare to bury the dead. Scarcely, however, had these different parties set to work when the blare of distant trumpets caused the whole force to desist. A hurried council of war was held, and orders were at once despatched to rally the scattered forces and to prepare to leave the position recently captured from their enemies, which was regarded as untenable against superior numbers. It soon became apparent from the accounts of those who had witnessed the far-stretching lines of the approaching enemy that Sir Ralph de Manton, the Cofferer, was at hand, with the main body of his army, and that the struggle now forced upon the Scots leaders would be a desperate one against an enemy furious at the defeat of its comrades, and confident in the strength of its numbers. Although the English chroniclers say nothing on the subject, it appears, from the accounts of the Scots historians, that the leaders of the defending army gave orders that certain of the prisoners taken in the first encounter, whom it was found impossible to remove with the army to the new position, should be put to death lest they should join the enemy, or if retained as prisoners with the Scots army, should engross the services of too many of the Scots during the approaching desperate struggle for their lives as well as for the liberty of Scotland. Cruel as this course may appear to arm-chair historians of to-day, there was ample precedent in the conduct of the English king Edward for such an extreme act of cruelty. There were those in the Scots army—among them Sinclair of Roslin, himself an eye-witness—who could not forget that after the capture of Berwick Edward caused the citizens to be slaughtered, without regard to 'age, sex, or sacred office,' to the number of many thousands; and it is to be remembered that after the victories of Creçy and Poitiers the English slew their prisoners. In this case the Scots had the sufficient reason, in their eyes, of the threatened danger of harbouring a hostile force in their midst during a fiercely contested struggle, an excuse which in all of the cases above cited was wanting. The spot where the prisoners were slain may be identified by the fact that the portion of the Bilston Burn at Roslin where the Scots crossed the stream to occupy the stronger post behind the river is called the 'Kill' Burn to this day. It skirts on the south the 'Shin-bane' field, where for long years afterwards the plough was wont to turn over the great bones of horse and man lying scarce buried in the loam.

Then it was that the Scots leaders gave the final order to their assembled forces to march under the guidance of Saintclair, 'who knew all those bounds,' as the old writers tell us, across the Bilston

and Dryden Burns to the moorland lying on the south-east, where the broad and deep valley of the Esk formed a sufficient defence on the south, and where the trees and tangled brushwood and steep banks of the two streams which they had just crossed formed a natural fosse on the north, while the larger course of the combined streams hurrying between high banks, thickly wooded, to join the Esk, provided a strong defence in front against the attacks of the heavily armed and mounted men-at-arms, of whom the approaching force largely consisted.

Here the weary Scots awaited the attack of the second army, which had numbered ten thousand fresh troops, but was now hugely augmented by the fugitives from the first division, already defeated. Burning with rage at the daring deed of the Scots, and sworn to avenge his fallen comrades, who were now met with on the scene of the former encampment, the proud leader of the main body, Sir Ralph de Manton, gave the order for an instant attack on the foe. Rushing wildly down the slopes towards the stream, the Southron soldiers bravely sought to come to close quarters; but being obstructed in the bushes and closely wooded ground, and by the steep banks of the rivulet, which rendered the direct attack by horsemen well-nigh impossible, many were slain in the first onset, and the remainder recoiled for reinforcements. Again and again was the attack renewed without success, till, with a mighty effort, and calling loudly to their comrades to follow, a compact force of footman armed with spears and bows, and a strong party of men-at-arms, secured a lodgment within the Scottish lines. Victory seemed in the grasp of the Southrons. Then it was that Sir Simon Fraser rode along the Scots lines reminding the men of the terrible fate of themselves and their families should they yield to the enemy. With loud cries, the patriots responded, and with irresistible impetuosity they drove the invaders back till not a foeman remained excepting numerous prisoners, who, borne down with their arms and accoutrements, found it impossible to escape. Among these was their leader, Sir Ralph the Cofferer himself. The English felt themselves paralysed and unable to attempt a rescue. They accordingly drew off such of their forces as could be extricated from the mêlée, and swift messengers were despatched to the third division, led by Sir Robert Neville, to affect a junction without delay.

(To be continued.)

THE BONE-HUNTER.

By Day Allen Willey.

WE know of the 'big-game hunter' as the man who ventures far from civilisation and often into unknown regions in his quest for such animals as elephants, lions, tigers, mountain sheep, and polar bears—beasts which may inhabit the midst of the jungle or forest, the slopes of high mountains, even the great icefields which for so many months in the year cover such a large area of the Arctic Ocean. But there is another hunter for big game who often endures as many hardships and braves as many perils as the one who follows the trail in the forest with rifle in hand. The work of the fossil-seeker in recent years has led him to spend months in the deserts of the Old and New Worlds, and go into regions not only uninhabited by human beings, but containing nothing in the way of food or even a drop of water to nourish him. Strange to say, his greatest discoveries are in places where the world has literally been dead for centuries.

Bone Cabin Quarry, Wyoming, as it is known to scientists the world over, is by far the greatest hunting-ground for these animals of the past that has yet been discovered, but it is only a small corner of the region where they lived. The story of the hill and valley, as read by the geologist, shows that this was once a fertile country, with its trees and grass and bushes nourished by rivers and lakes, so that it afforded abundant food for the biggest living things that inhabited the land. That they roamed over this part of the earth is shown by the finding of their gigantic skeletons many miles from the 'quarry;' for, since it was first visited, the Bad Lands of America have been the gathering-place for fossil-hunters from both the Old and the New World. The locality forms a vast graveyard for the monster lizards known as dinosaurs, as well as strange horses that lived in the old days, crocodiles older than any that ever floated in the Nile, and mammoth turtles.

The way in which these hunters of extinct animals and reptiles find their mighty game is interesting. In searching for it they bring to their aid geology and natural history. Their weapons are chiefly the pick, shovel, and spade; but some of the places containing the skeletons are so large that they use ploughs and scrapers drawn by horses to remove the earth-covering. When the fossil-hunter reaches a spot where he believes bones are to be found he examines the nature of the rock, if any; he looks carefully at the composition of the soil, and notices the direction and rise of the hills. Nature buried these animals in a curious way in certain layers of earth and rock. Sometimes a part of the layer lies close to the surface of the plain or forms the jutting hillside; the other end of the layer may be thousands of feet below the top. It so happens that a part of the graveyard of the dinosaurs comes to the surface right at the

Bone Cabin Quarry and in the Como Bluffs, which are also in the territory of the United States known as Wyoming. In fact, nearly all of the little valley lying near the Bow Head River in this part of Wyoming is in the graveyard; but the geologist says it is nearly three hundred feet deep, and as yet the hunters have dug only a few feet down into it. So no one knows how many creatures of the past will be found as the hunt progresses.

It is worth while to tell how this curious quarry came to be known as Bone Cabin. A party of fossil-seekers were travelling through what was known as the Bad Lands, when they chanced upon a little hut, once the home of a sheep-herder, but long since abandoned. Their curiosity was aroused by this, the only sign of human habitation they had come across, and naturally they peered about it. One of the party noticed that the house did not rest directly upon the ground, but upon piles of what seemed to be dark-coloured stones. In this part of the Bad Lands one seldom sees even a pebble, and the stones aroused his interest. 'I wonder where the fellow got those stones,' the man remarked as he called the attention of his companions to them. Pulling out one of the 'stones' which had become loosened, he gave an exclamation of surprise. Looking at the dingy-coloured substance carefully, he said, 'This is a tiny part of one of the greatest creatures known to man. It is a fragment of a brontosaurus.' A messenger carried the news to the nearest town. Thence it was given to the world by the electric current, and fossil-hunters throughout America and Europe received the intelligence. Fortunately Mr Walter Granger, the scientist who made the discovery, is connected with the Museum of Natural History in New York. Realising that the bones the sheep-herder had thrown together to support his home had probably been taken from the ground near by, he began digging up the earth. After a few hours' work his shovel struck against a hard substance which it could not penetrate. Working around it, he finally uncovered another piece—a single bone longer than a man of ordinary height. This was also a part of the skeleton of the brontosaurus.

It seems strange that ancestors of the lizard so small as to be easily held in the palm of the hand at one time grew to such enormous size that no creature known to have existed on land has ever equalled them in dimensions. When the fossil-hunters, after months of digging, revealed the other bones along with the one discovered by Mr Granger, an idea of the immensity of the brontosaurus was gained. This skeleton was finally put together, and the great animal placed in the position which it had assumed in life. The single bone six feet in length may convey to the reader some conception of its proportions, but it actually measures a few inches less than sixty-seven feet from the end of its nose to the tip of its tail. As it stands in the American Museum of Natural History it reaches nearly to the ceiling and from side to side of the room, for its height at what the naturalists call the hips is fifteen feet above the floor. Its tail alone stretches out a distance of thirty-one feet, while its neck makes that of a giraffe appear in comparison like a chicken's, being no less than seventeen feet in length. If we were to weigh the thigh-bone apart from the rest, it would tip the scales at nearly six hundred pounds, even before it was petrified. Various estimates have been given of the weight of these monsters, but naturalists believe that in life the one described must have weighed not far from twenty-five tons. The largest animals that now exist on land are the African elephants. Suppose we were to place three of them in line, one directly in front of the other, this ancient lizard would be longer than the three, while it would actually weigh about ten tons more than the herd of them. But, despite its size, the brontosaurus could go from place to place quite rapidly, considering its bulk, forcing its way through the swamps, and uprooting trees which stood in its pathway by the mere pressure of its body. Large rivers were no bar to its progress, for it could wade in water twenty feet deep, and, it is believed, could swim short distances. It lived upon plants and the tender shoots and leaves of trees. Most of us have seen an elephant lifting up his trunk, and may have been amazed at the height to which he could stretch it. Imagine an animal which could put its head into a tree-top thirty feet high and browse!

The bone-hunters, however, have learned that there were several different species. Though all are called dinosaur—a Greek term which, translated into English, means 'terrible lizard'—the largest were almost as harmless as the tiny things that women once wore on their persons with gold chains, making pets of them. As they ate only plants and foliage of trees, their teeth were soft and could not be used to injure man or animal. Strange to say, a smaller dinosaur has been found in the Bad Lands of Wyoming which, it is believed, lived on flesh, for its teeth are very large and sharp. Though not half the size of the great brontosaurus, it was a cannibal preying on the other, for tail-bones of the plant-lizard have been found showing deep cuts that were evidently made ages ago. The teeth of the small dinosaur exactly fit into these wounds, leading palæontologists to believe that the flesh-eating or carnivorous lizards killed many of their big brothers, trying to get at the marrow and cartilage in their tails.

The finding of such creatures as these can indeed be called the hunting of big game, and since the discovery at Bone Cabin Quarry numbers of investigators every year have been exploring this part of Wyoming that forms such a great burial-ground for the monsters. Yet this is only one corner where mammoth remains are known to exist. On the other side of the world, in Africa, the bluffs of the famous Libyan Desert also cover huge skeletons, among them bones of the animals which were the ancestors of the elephant as we know him, but a beast more than twice the size of the one still

found in the African forest, to which we have already referred. In places where the covering of the desert has been dug away so many fragments of these prehistoric creatures have been secured that within the past year they formed a large portion of the cargo of the steamship which brought them from Africa to New York.

Bone Cabin Quarry itself is a revelation, however. After the cabin was torn down and the richness of the 'find' revealed, the explorers determined to discover all that was to be discovered in this locality; so the ground was divided into spaces twelve feet square, and one after another was opened. It has taken over six years, working with the plough and shovel and spade, to turn up only about seven thousand five hundred square feet, or less than one-fifth of an acre of surface; yet this small space formed the resting-place of parts of seventy-three different animals, of which forty-four belonged to the family of dinosaurs. The explorers believe that on this spot fully one hundred of these creatures have lain in the earth for ten millions of years or more. The exploration of the Bad Lands has made western America a veritable treasure-house for the fossil-hunters; but before the discovery of the Bone Cabin Quarry they had been securing such 'game' as elephants, tigers, and camels, although none of these were alive when the lizard giants roamed in their marshes. We think of the camel in connection with the deserts of Africa and Asia; but beasts far larger than any which have ever formed the caravans of the Sahara wandered over south-western America, where their skeletons have been unearthed by the pick and shovel. Tigers bigger and more ferocious than the dreaded Indian man-eater, with teeth as sharp as the sabre's edge, preyed upon the inhabitants of the South American forests; while there was a period in the history of the world when elephants came all the way from Africa to the western half of the globe, and there lived for thousands of years. Within a few miles of New York City itself the hunters have found them, although their big skeletons have also been dug up away to the southward in the State of Texas.

When the prospector believes he has reached a part of his unique hunting-ground he first looks carefully about for any object that may be lying on the top. Frequently he comes across bones of a sheep, sometimes of a hare, but recognises them at once by their whiteness and freshness. Anything that has a dull-brown appearance is closely studied, though it may not resemble a bone, for where a thing has existed millions of years time may have crumbled it away. If the prospector finds nothing, the shovel comes into service. He digs here and there, making test-holes. Perhaps he may go on day after day in fruitless search, until the weeks have passed into months, and he has gone over miles of the region without making a find. Then, when he is about to give up in despair, and depart to some more likely place, the shovel may reach a deposit, the grave of perhaps a dozen animals. As in the case of the Bone Cabin discovery, in a day he has found a fortune in material for the scientist. Bone-hunting is much like gold-hunting; one may unearth a pocket or a nugget when least expected.

The find made, the next step is to secure the bones. While some of the larger bones are unbroken, frequently the skeleton may be in a thousand pieces, some a hundred feet or so from the rest. To pick out the right ones and separate them from the others may mean weeks of patient toiling, day after day, in the burning sun.

The hunter must also know how the bones were put together by nature. As fast as he identifies the parts he numbers each one, then packs it for its long journey. When the bone is fragile and cracked or broken he fills in the crevices with liquid plaster, which hardens and thus cements the fragments together. Sometimes the surface of the bone is first covered with silk paper or thin cloth to protect it from the air. Then the whole piece is covered with plaster as a further protection before being placed in the box or crate in which it is to be sent to the museum. This part of the work requires not a little care, for some single pieces of skeletons are so large that they must be hoisted from their beds by a derrick. Still, in spite of their size, these bones must be uncovered very cautiously, though they have long since turned to stone. A single blow of pick or shovel may badly damage a specimen which otherwise is perfect.

MY DREAM.

I LOVE to dream of pleasant things
  Which come to those who wait,
Although the present never brings
  What I anticipate.

For, after all, what Heav'n may send
  Time cannot always bring,
Or waiting always have its end
  Till time has had its fling.

And pleasant dreams which wake in pain
  May furnish us the price
Which we can pay to Heav'n again,
  A needed sacrifice.

The joys for which I still must wait,
  The rapture almost mine,
I have the right at any rate
  Completely to resign.

And even then not all has gone;
  My dream lives from the past,
And forms again another one
  As lovely as the last.

And so, whatever comes with day,
  Or life may really seem,
Whatever happens, anyway
  I have my lovely dream.

SOME CELEBRITIES I HAVE KNOWN.

By A. STODART WALKER.

PART III.

ROBERT BUCHANAN (*continued*), HON. RODEN NOEL, HERBERT SPENCER, THOMAS HENRY HUXLEY, WILLIAM RUTHERFORD.

NO man that I ever knew was so loyal to friendship, no one was so imbued with the religion of blood and friend attachment, as Buchanan; and the only real fear that oppressed him, when he drew near the valley of the dark shadow, was that his loyal friend, a devoted young sister-in-law and adopted daughter, might be left penniless. The death of his mother had been the great grief of his latter days. 'I have laid her to rest at Southend,' he wrote to me, 'in a beautiful graveyard by the sea, close to places where she used to be happy. What I shall do now I hardly know. My wits seem numbed, my whole grasp of things gone. Sometimes I hardly seem to grieve at all; at others all my desolation comes back like a torrent. I thought on Sunday last that my own last hour had come, I was so worn out with watching and sorrowing. I absolutely think my reason was saved by a large dose of a homeopathic drug (*ignatia amara*), which turned my anguish into a sort of horrid apathy, but saved my nervous system from total collapse. In my terrible trial my dear Harriet has proved a blessed comforter, and in more ways than one my darling's death has been fraught with blessing. Friends who had grown bitter against me came back for her sake, and gave me their hands. All her influence has been good and holy, like herself. There was never such a mother. The world can never match such a love. I would give everything now for such faith as I once felt. I seem to have none. And then what is left if we abandon the idea of eternal life, as reason teaches us to do? Only a horrible nightmare, a devil's dream.' 'My only prayer now is,' he wrote at another time, 'that I may live for a year or two to complete certain work. I am miserable, too, because if I go *now* my dear and only companion, the purest and sweetest angel that has ever come to me in this dark life, will be left penniless, at the mercy of the world. That is really all I care for, and all that unmans me at the thought of death.'

My recollections of Robert Buchanan would be incomplete did I not include a fragment of his which I value highly as being the last verses he ever wrote, and which I was able to publish in a small volume sold privately, and may now reach a larger audience. They seem to me to embody the very essence of Buchanan's final attitude to the eternities:

'Lord, I believe; help Thou mine unbelief!'
I murmur'd 'mid the snowstorm of my grief;
Dark as the sunless pall
The folds of darkness fall,
Closing my life's dim day, so strange, so brief!

Lord, I believe; and yet, O Lord, how chill
And frozen grows the faith I cling to still!
Once it was bright and sweet,
Swift as a young man's feet,
Fair as a young maid's smile, strong as a warrior's will.

The dumb and wistful yearning and desire
Through these dark clouds of sense to something higher,
All the long, lonely years,
I've sung through smiles and tears,
But now my hand drops heavily down the lyre!

And lo! instead of gladsome faëry gold,
A few black withered leaves are all I hold.
Help then mine unbelief!
Comfort Thy child's last grief,
Stoop to Thy wandering sheep, and bear him to Thy fold!

The first line of the third stanza is evidently borrowed from R. H. Hutton's criticism of the poet: 'The dumb, wistful yearning in man to something higher—yearning such as the animal creation showed in the Greek period towards the human—has not as yet found any interpreter equal to Buchanan,' an opinion shortly afterwards seconded by George Henry Lewes, who said: 'He must unquestionably

[*All Rights Reserved.*]

attain an exalted rank amongst the poets of this century, and produce works which cannot fail to be accepted as incontestably great and worthy of the world's preservation.' 'Whilst such works as *The City of Dream* are produced by Robert Buchanan,' said Mr Lecky, 'it cannot be said that the artistic spirit in English literature has very seriously decayed.'

In my many wanderings with Buchanan he took me to see two men whose personalities interested me deeply. These were the Hon. Roden Noel and Mr Herbert Spencer. Mr Noel was essentially the man as poet, gentle, retiring, unassuming, and cultured; he had no axes to grind nor logs to roll. He reminded me, with his big flap-collar and the lock of hair which made vagabond wanderings over his finely shaped forehead, of certain portraits of Byron, though it need hardly be said that there was little likeness between the two men either in literary quality or in character. Mr Noel was no publicist, and shunned at all times the methods of the artistic adventurer. He had all the traditional characteristics of the reticent and diffident poet, though in private the warmth of his nature and the generous enthusiasm of his ideals made of him a man beloved. Mr Herbert Spencer was a different counter altogether. The mathematical precision with which he carried out his scheme of life has already been noticed by more than one writer. When first I went to call upon him alone, he took his watch from his pocket and laid it on the table beside him, and remarked, 'I must not allow myself to speak to you for more than a quarter of an hour.' Consequently, at the end of the appointed time our conversation ended suddenly, and we both fell back upon a marked silence, like the ends of a snapped elastic. I rose to go, but he permitted himself to explain that he hoped his silence would not rob him of the pleasure of my staying to lunch. I accordingly picked up a book till such a time as the oracle would deign to speak. At that time I think I was as convinced a Spencerian as Tolstoi's hero in *Resurrection* or Kipling's 'Harry Chunder Mookergee.' Like many another, I fancy, at that time I could have as little omitted the name of Mr Spencer from any of my quondam philosophical writings as the modern woman-novelist could omit quoting from Omar Khayyám. I remember our conversation dealt chiefly with the absence of the cult of satire from modern literature, and he expressed himself in much the same language as he used in a letter to Robert Buchanan which I have in my possession: 'Why do you not devote yourself to a satire on the times? There is an immensity of matter calling for strong denunciation and display of white-hot anger, and I think you are well capable of dealing with it. More especially I want some one who has the ability, with sufficient intensity of feeling, to denounce the miserable hypocrisy of our religious world, with its pretended observances of Christian principles side by side with the abominations which it habitually assists and countenances.' He referred to wars and the machinations of the Stock Exchange. 'In our political life, too, there are multitudinous things which merit the severest castigation: the morals of party strife, and the way in which men are, with utter insincerity, sacrificing their convictions for the sake of political and social position.' Mr Spencer struck me as being terribly in earnest even about small matters—so much so as to suggest that he had not yet been introduced to Mr George Meredith's Comic spirit; but at the same time he was a man of large imagination, and in many ways a dreamer. He was no pessimist, but as full of the joy of life as Walt Whitman. He seemed a solitary figure, sitting apart from the world, 'holding no form of creed, yet contemplating all.' He was as brave as Heine and as Spinoza in the face of constant illness, giving himself over, even when the light of life grew dim and uncertain, to the completion and perfection of his System. He seemed to me the most simple of men in the youthfulness of his outlook on life, in his buoyant joy in humanity and its possibilities. That he was an optimist cannot he denied, and I remember how he poured disdain upon my views that the altruistic spirit has not evolved in man. He held that the race grew nearer and nearer to ultimate perfection, while I ventured to suggest a series of epicycles as representing the moral action of the centuries; and even he admitted once to me that he believed the present tendency was a drifting back to a moral and intellectual barbarism. It is impossible for me to recall many of his exact dicta; but I do recall one sentence, which rang in my ears for some time; it was spoken with so much modulated care that it echoed in my brain months after: 'I do not regard,' he said, 'a thing as *known* unless it can be presented in consciousness under some quantitative or qualitative limitation, and for this reason I distinguish the unknowable as that of which we remain vaguely conscious when the limitations implied by knowledge are absent.' A truly Spencerian deliverance!

I can recall only one visit which Mr Spencer paid to our home—it was at Alta-na-craig, in Argyllshire. There was much domestic terror evinced at the entertaining of such a 'philosophical monster,' but matters soon became adjusted when Mr Spencer dashed into a very human and light disquisition on the Highlands and Highland innkeepers, whom he abused frankly; concluding with a special onslaught upon those who tipped railway porters 'and so contrived every railway disaster ever recorded.' A battle-royal ensued, and Mr Spencer, with his distaste for heated argument, soon stole, like the Arab, silently away. 'We have had a very stormy interview, Mrs Blackie,' were his parting words. During the long and last illness of Mr Buchanan, he wrote frequently to me with

anxious and tender inquiries after the health of the poet, and begged of me to assure him that no financial difficulty stood in the way of the careful and skilful nursing of his old friend.

Professor Huxley seemed to me the very incarnation of sanity, for grafted on to a first-rate knowledge of scientific methods and results was an imagination of the richest and most expansive order (though he on more than one occasion spoke disparagingly to me of 'mere writers of imaginative literature'). To this was supplemented a supreme sense of humour, a quality not supposed to exist often, but which I have found almost uniformly amongst men who give over the main part of their lives to physiological and physical research. Had Huxley's sympathies not been on the scientific side he might have been a first-rate man of letters. His style was graphic, direct, and carefully balanced; his sentences were cut clean as by a rapier. He was never ornate or pompously grandiloquent, and in his argument there was no anticlimax. The first letter I received from him was short and to the point: 'In studying physiology, avoid books as far as possible; study life from the living. My crayfish volume must have taught you little if it did not teach you that.' He was impatient with charlatanism of all kinds, and resented the intrusion of the amateur and the dilettante into the regions of scientific and philosophical research. 'As for your quoting X.,' he wrote to me, 'I associate him merely with hare-brained excursions into esoteric speculation; and as for Z., he is a mere writer of imaginative literature. If there is to be a fight, supply me with foemen more worthy of my steel.' I met him on more than one occasion in Edinburgh and London. We quoted for his benefit Robert Louis Stevenson's deprecatory estimate of the Edinburgh climate. 'I quite agree with him,' said Huxley. 'I now understand why Edinburgh people are so strong: your *summer* kills off all the weak ones.' On another occasion a dispute took place between Huxley, Blackie, and the late Duke of Argyll as to the possession of the sense of humour by Scotsmen. The argument was learned and illuminative, until Huxley dragged in Sydney Smith. 'You know Sydney Smith said it took a surgical instrument to put a joke into the head of a Scotsman,' challenged the scientist. 'Yes,' retorted Blackie, 'an English joke.' I recall a conversation I had with Huxley as to the prizes of this world going to those who accede to the 'general' and not to the pioneers and the children of revolt; and I was much struck by Huxley's great sanity and sense of humour in dealing with this problem. I think his attitude to the suggested burial of George Eliot in Westminster Abbey demonstrated this sanity more forcibly than anything he ever wrote: 'However much I lament the circumstances, Westminster Abbey is a Christian church and not a Pantheon, and the Dean thereof is officially a Christian priest, and we ask him to bestow exceptional Christian honour by this burial in the Abbey. George Eliot is known not only as a great writer, but as a person whose life and opinions were in notorious antagonism to Christian practices in regard to marriage and Christian theory in regard to dogma. How am I to tell the Dean that I think he ought to read over the body of a person who did not repent of what the Church considers moral sin a service not one solitary proposition in which she would have accepted for truth while she was alive? How am I to urge him to do that which, if I were in his place, I should most emphatically refuse to do? . . . One cannot eat one's cake and have it too. Those who elect to be free in thought and deed must not hanker after the rewards, if they are to be so called, which the world offers to those who put up with its fetters.' Which seemed to be the last and wisest word to be said on the matter.

Another distinguished man of science, with whom I was officially connected in the University of Edinburgh, was William Rutherford, a man of a remarkable personality, and yet so given over to the work of his chair as to avoid the life of a publicist, as in the case of Thomas Henry Huxley. I think Rutherford was the greatest teacher I have ever known, and I fancy this view would be shared by hundreds of others who had the privilege of attending his theoretical and practical classes. He took few steps to ensure popularity outside of the thoroughness of his own work; and yet, despite many unfortunate incidents in his career, despite much that might have made his name distasteful, he remained *facile princeps* the most popular and sought-after teacher in the Medical Faculty. I was his assistant for twelve months, and did a considerable amount of original work with him, and I can always speak of him as a slave to a sense of academic responsibility, and utterly reckless of the danger of overwork. In private life he was genial, if eccentric, and gave the few hours of his recreation to the furtherance of an art in which he might have become a master, for he possessed a magnificent voice, and might easily have taken a distinguished place in the singing world. He chiefly sang songs to his own composition, which revealed in a striking way the range and richness of his vocal compass. There are numerous stories associated with his name, many of which I can vouch for, even although he denied the truth of one of them. It probably slipped his memory, in much the same way as the famous 'Classes, lasses, and asses story' slipped the memory of John Stuart Blackie. He was once examining a student in physiology, and towards the end of the 'oral' he asked the young aspirant for degree if he had his calling-card with him. The undergraduate, scenting some special mark of favour from his teacher, responded rapidly in the affirmative, and drew the required card willingly from his pocket. Rutherford looked at him with immobile features for a moment, and then said, 'Will you

kindly write on that card all you know about physiology?' Curtain! At another time a man entered the examination-room in a condition extremely rare—that is, after a rather prolonged visit to a once famous University hostelry called 'Rutherford's.' The Professor began, 'Can you tell me, sir, what is negative variation?' The student, flabbergasted and nebulous, was heard to mutter, 'God knows!' Rutherford's ears were as quick as his tongue. 'And am I to presume, sir, that you share the knowledge with that individual?' When I went up to be examined orally in physiology, as was the practice I was locked into a side-room, so that the outcoming student should not reveal to me the secrets of the torture-chamber. As I was settling down to my anxious wait of a quarter of an hour, Rutherford entered. 'Have you a book to read?' he asked. 'No, sir,' I replied. 'Have you literature of any kind to appease your anxiety?' 'No, sir,' I repeated. 'Then, my dear Mr Walker,' he said, 'meditate on the infinities.' A student once ventured to ask him this question, 'Who is the greatest physiologist in Europe?' Rutherford's answer came without hesitation, a slight smile hovering round his eyes as he spoke, 'Helmholtz is the second greatest.' Like the majority of the professors in the Scottish universities, he was subject now and then to irrelevant and often rude interruptions on the part of the more irresponsible members of his class. On one occasion he was demonstrating the effect of a series of electrical shocks on nerve-tissue, and had to reiterate the words 'No effect' from time to time. He started another experiment, and having passed the faradic current, was about to intimate the result, when one of the students forestalled him, and cried out in a loud voice, 'No effect.' Rutherford raised his eyes and threw a look of amused contempt at the interrupter, and said, 'No, no effect; like water on a duck's back, like my efforts to instil knowledge into your brain and courtesy into your manners.' At another time he said, 'I persistently catch the words, "Hear, hear!" I desire that the gentleman should only "hear," and thus prepare himself for an examination ordeal for which I imagine he is but incompetently equipped.'

THE HOUSE OF WHISPERS.

CHAPTER XII.—EXPLAINS SOME CURIOUS FACTS.

GABRIELLE was silent for a moment. No doubt Stewart meant what he said; he was not endeavouring to alarm her unduly, but thoroughly believed in supernatural agencies.

'I suppose you've already examined the ruins thoroughly, eh?' she asked at last.

'Examined them?' echoed the gray-bearded man. 'I should think sae, aifter forty-odd years here. Why, as a laddie I used to play there ilka day, an' ha'e been in ilka neuk an' cranny.'

'Nevertheless, come up now with me,' she said. 'I want to explain to you exactly where and how I heard the voices.'

'The Whispers are an uncanny thing,' said the keeper, with his broad accent. 'I dinna like them, miss; I dinna like tae hear what ye tell me ava.'

'Oh, don't worry about me, Stewart,' she laughed. 'I'm not afraid of any omen. I only mean to fathom the mystery, and I want your assistance in doing so. But, of course, you'll say no word to a soul. Remember that.'

'If it be yer wush, Miss Gabrielle, I'll say naething,' he promised. And together they descended the steep grass-slope and overgrown foundations of the castle until they stood in the old courtyard, close to the ancient justice-tree, the exact spot where the girl had stood on the previous night.

'I could hear plainly as I stood just here,' she said. 'The sound of voices seemed to come from that wall there;' and she pointed to the gray flint wall, half-overgrown with ivy, about six yards away.

Stewart made no remark. It was not the first occasion on which he had examined that place in an attempt to solve the mystery of the nocturnal whisperings. He walked across to the wall, tapping it with his hand, while the faithful spaniel began sniffing in expectancy of something to bolt.

'There's naething here, miss—absolutely naething,' he declared, as they both examined the wall minutely. Its depth did not admit of any chamber, for it was an inner wall; and, according to the gamekeeper's statement, he had already tested it years ago, and found it solid masonry.

'If I went forward or backward, then the sounds were lost to me,' Gabrielle explained, much puzzled.

'Ay. That's juist what they a' said,' remarked the keeper, with an apprehensive look upon his face. 'The Whispers are only h'ard at ae spot, whaur ye've juist stood. I've seen the lady a' in green masel', miss—aince when I was a laddie, an' again aboot ten year syne.'

'You mean, Stewart, that you imagined that you saw an apparition. You were alone, I suppose?'

'Yes, miss, I was alane.'

'Well, you thought you saw the Lady of Glencardine. Where was she?'

'On the drive, in front o' the hoose.'

'Perhaps somebody played a practical joke on you. The Green Lady is Glencardine's favourite spectre, isn't she—perfectly harmless, I mean?'

'Ay, miss. Lots o' folk saw her ten year syne. But nooadays she seems to ha'e been laid. Somebody said they saw her last Glesca holidays, but I dinna believe't.'

'Neither do I, Stewart. But don't let's trouble

about the unfortunate lady, who ought to have been at rest long ago. It's those weird whisperings I mean to investigate.' And she looked blankly around her at the great, cyclopean walls and high, weather-beaten towers, gaunt yet picturesque in the morning sunshine.

The keeper shook his shaggy head. 'I'm afear'd, Miss Gabrielle, that ye'll ne'er solve the mystery. There's somethin' sae fatal aboot the whisperin's,' he said, speaking in his pleasant Highland tongue, 'that naebody cares tae attempt the investigation. They div say that the Whispers are the voice o' the De'il himsel'.'

The girl, in her short blue serge skirt, white cotton blouse, and blue tam-o'-shanter, laughed at the man's dread. There must be a distinct cause for this noise she had heard, she argued. Yet, though they both spent half-an-hour wandering among the ruins, standing in the roofless banqueting-hall, and traversing stone corridors and lichen-covered, moss-grown, ruined chambers choked with weeds, their efforts to obtain any clue were all in vain.

To Gabrielle it was quite evident that the old keeper regarded the incident of the previous night as a fatal omen, for he was most solicitous of her welfare. He went so far as to crave permission to go to Sir Henry and put the whole of the mysterious facts before him.

But she would not hear of it. She meant to solve the mystery herself. If her father learnt of the affair, and of the ill-omen connected with it, the matter would surely cause him great uneasiness. Why should he be worried on her account? No, she would never allow it, and told Stewart plainly of her disapproval of such a course.

'But, tell me,' she asked at last, as, returning to the courtyard, they stood together at the spot where she had stood in that moonlit hour and heard with her own ears those weird, mysterious voices coming from nowhere—'tell me, Stewart, is there any legend connected with the Whispers? Have you ever heard any story concerning their origin?'

'Of coorse, miss. Through all Perthshire it's weel kent,' replied the man slowly, not, it seemed, without considerable reluctance. 'What is h'ard by those doomed tae daith is the conspiracy o' Charles Lord Glencardine an' the Earl o' Kintyre for the murder o' the infamous Cardinal Setoun o' St Andrews, wha, as I dare say ye ken fra history, miss, was assassinated here, on this very spot whaur we stan'. The Earl o' Kintyre, thegither wi' Lord Glencardine, his dochter Mary, an' ane o' the M'Intyres o' Talnetry, an' Wemyss o' Strathblane, were a year later tried by a commission issued under the name o' Mary Queen o' Scots; but sae popular was the murder o' the Cardinal that the accused were a' acquitted.'

'Yes,' exclaimed the girl, 'I remember reading something about it in Scottish history. And the Whispers are, I suppose, said to be the ghostly conspirators in conclave.'

'That's what folk say, miss. They div say as weel that Auld Nick himsel' was present, an' gied the decision that the Cardinal, wha was to be askit ower frae Stirlin', should dee. It is his evil counsel that is h'ard by those whom death will quickly overtake.'

'Really, Stewart,' she laughed, 'you make me feel quite uncomfortable.'

'But, miss, Sir Henry already kens a' aboot the Whispers,' said the man. 'I h'ard him tellin' a young gentleman wha cam' doon last shootin' season a guid dale aboot it. They veesited the auld castle thegither, an' I happened tae be hereaboots.'

This caused the girl to resolve to learn from her father what she could. He was an antiquary, and had the history of Glencardine at his finger-ends.

So presently she strolled back to Stewart's cottage, and after receiving from the faithful servant urgent injunctions to 'have a care' of herself, she walked on to the tennis-lawn, where, shaded by the high trees, Lady Heyburn, in white serge, and three of her male guests were playing.

'Father,' she said that same evening, when they had settled down to commence work upon those ever-arriving documents from Paris, 'what was the cause of Glencardine becoming a ruin?'

'Well, the reason of its downfall was Lord Glencardine's change of front,' he answered. 'In 1638 he became a stalwart supporter of Episcopacy and Divine Right, a course which proved equally fatal to himself and to his ancient Castle of Glencardine. Reid, in his *Annals of Auchterarder*, relates how, after the Civil War, Lord Dundrennan, in company with his cousin, George Lochan of Ochiltree, and burgess of Auchterarder, and the Laird of M'Nab, descended into Strathearn and occupied the castle with about fifty men. He hurriedly put it into a state of defence. General Overton besieged the place in person, with his army, consisting of eighteen hundred foot and eleven hundred horse, and battered the walls with cannon, having brought a number of great ordnance from Stirling Castle. For ten days the castle was held by the small but resolute garrison, and might have held out longer had not the well failed. With the prospect of death before them in the event of the place being taken, Dundrennan and Lochan contrived to break through the enemy, who surrounded the castle on all sides. A page of the name of John Hamilton, in attendance upon Lord Dundrennan, well acquainted with the localities of Glencardine, undertook to be their guide. When the moon was down, Dundrennan and Lochan issued from the castle by a small postern, where they found Hamilton waiting for them with three horses. They mounted, and, passing quietly through the enemy's force, they escaped, and reached Lord Glencardine in safety to the north. On the morning after their escape the castle was surrendered, and thirty-five of the garrison were sent to the Tolbooth of Edinburgh. General Overton ordered the remaining twelve of those who had surrendered to be shot at a post, and

the castle to be burned, which was accordingly done.'

'The country-folk in the neighbourhood are full of strange stories about ghostly whisperings being heard in the castle ruins,' she remarked.

Her father started, and raising his expressionless face to hers, asked in almost a snappish tone, 'Well, and who has heard them now, pray?'

'Several people, I believe.'

'And they're gossiping as usual, eh?' he remarked in a hard, dry tone. 'Up here in the Highlands they are ridiculously superstitious. Who's been telling you about the Whispers, child?'

'Oh, I've learnt of them from several people,' she replied evasively. 'Mysterious voices were heard, they say, last night, and for several nights previously. It's also a local tradition that all those who hear the whispered warning die within forty days.'

'Bosh, my dear! utter rubbish!' the old man laughed. 'Who's been trying to frighten you?'

'Nobody, dad. I merely tell you what the country-people say.'

'Yes,' he remarked, 'I know. The story is a gruesome one, and in the Highlands a story is not attractive unless it has some fatality in it. Up here the belief in demonology and witchcraft has died very hard. Get down Penny's *Traditions of Perth*—first shelf to the left beyond the second window, right-hand corner. It will explain to you how very superstitious the people have ever been.'

'I know all that, dad,' persisted the girl; 'but I'm interested in this extraordinary story of the Whispers. You, as an antiquary, have, no doubt, investigated all the legendary lore connected with Glencardine. The people declare that the Whispers are heard, and, I am told, believe some extraordinary theory regarding them.'

'A theory!' he exclaimed quickly. 'What theory? What has been discovered?'

'Nothing, as far as I know.'

'No, and nothing ever will be discovered,' he said.

'Why not, dad?' she asked. 'Do you deny that strange noises are heard there when there is so much evidence in the affirmative?'

'I really don't know, my dear. I've never had the pleasure of hearing them myself, though I've been told of them ever since I bought the place.'

'But there is a legend which is supposed to account for them, is there not, dad? Do tell me what you know,' she urged. 'I'm so very much interested in the old place and its bygone history.'

'The less you know concerning the Whispers the better, my dear,' he replied abruptly.

Her father's ominous words surprised her. Did he, too, believe in the fatal omen, though he was trying to mislead her and poke fun at the local superstition?

'But why shouldn't I know?' she protested. 'This is the first time, dad, that you've tried to withhold from me any antiquarian knowledge that you possess. Besides, the story of Glencardine and its lairds is intensely fascinating to me.'

'So might be the Whispers, if ever you had the misfortune to hear them.'

'Misfortune!' she gasped, turning pale. 'Why do you say misfortune?'

But he laughed a strange, hollow laugh, and, endeavouring to turn his seriousness into humour, said, 'Well, they might give you a turn, perhaps. They would make me start, I feel sure. From what I've been told, they seem to come from nowhere. It is practically an unseen spectre who has the rather unusual gift of speech.'

It was on the tip of her tongue to explain how, on the previous night, she had actually listened to the Whispers. But she refrained. She recognised that, though he would not admit it, he was nevertheless superstitious of ill results following the hearing of those weird whisperings. So she made eager pretence of wishing to know the historical facts of the incident referred to by the gamekeeper.

'No,' exclaimed the blind man softly but firmly, taking her hand and stroking her arm tenderly, as was his habit when he wished to persuade her. 'No, Gabrielle dear,' he said; 'we will change the subject now. Do not bother your head about absurd country legends of that sort. There are so many concerning Glencardine and its lords that a whole volume might be filled with them.'

'But I want to know all about this particular one, dad,' she said.

'From me you will never know, my dear,' was his answer, as his gray, serious face was upturned to hers. 'You have never heard the Whispers, and I sincerely hope that you never will.'

(To be continued.)

HOUSEHOLD WASTE.

A WELL-KNOWN manufacturer of mustard is reported to have said that he made his fortune not by the mustard that people ate, but by what they left on their plates; and this is a very good keynote to the subject of household waste.

To begin with, it is wasteful to buy, without judgment, either in too large or too small quantities. Such things as sugar, tea, soap, candles, oatmeal, and grains are cheaper bought in quantities, if there is sufficient storage-room to keep them dry; candles and soap, like boots, improve by keeping, and go much further; jam does not deteriorate if kept the year round, but may require watching to see that it does not go mouldy; and vinegar and oil should be bought by the gallon, matches by the dozen boxes, and only the best. And here it is as well

to say that, as a rule, the best of everything is in the end the best value to buy; cheap butter will make certain things quite uneatable, and it can hardly be considered thrifty to save a penny on eggs and have to throw away one in every dozen. On the other hand, it is wasteful to buy vegetables or fruit or other perishable articles in quantities, however cheaply they may be offered, as they decay and become unusable, or else are eaten up simply to save waste.

Waste often arises from not watching the market and buying the right thing at the right time; but here comes in the perpetual difficulty of the inelastic household allowance. Even the most unthrifty woman realises that to buy coal in summer at a pound a ton, and store as many tons as her cellar can hold, is better than buying monthly, say, a couple of tons when the price has risen to twenty-seven shillings; but very few have the necessary ten or twelve pounds to pay down at once, though there is no doubt as to the economy. The same with wood, briquettes, or firelighters, which all go up in price during the winter. Briquettes have become almost unknown; but they are a useful possession, and keep in a fire at small cost if it is only required to smoulder. Fires are a great consideration, and very few people realise how coal may be eked out and the dust-bin kept within decent limits at the same time. All egg-shells, potato-peelings, and nut-shells can and ought to be put on the kitchen fire, in town, when fierce heat is not required. I say *in town* advisedly, because in the country a great deal goes to the chickens, and is thus disposed of in an equally satisfactory way. A hungry brood of chickens can be trusted to reduce waste in an exemplary manner. It is extravagant to burn various kinds of light. If you have electric light, with gas or lamps, each account appears small until the day of reckoning; then they unite into a pretty large total; they overlap and are used wastefully, and it is only at the dismal quarters that we realise that we have been spendthrifts. If you have electric light installed, it is better that it should run through the house, as then you can see by your bill what the average consumption should be, and insist on it.

The only exception to this rule is in the matter of an oil-stove for use in summer. This is a distinct saving in coal, and is a great comfort in hot weather, as it can be turned out directly the moment of use is over. A woman may sometimes with advantage take a leaf out of a man's book in his methods of expenditure. He never buys claret or whisky by the bottle; he buys in quantities, and leaves it to mature; but then, as a rule, he holds the cheque-book, and the art of thrift is with him who can buy the right thing, in the right quantities, at the right time.

Of course, even with coal at famine prices, it is always an extravagance to buy cooked food. It increases the cost so enormously that no rise in the price of coal can justify it, and as a rule it means an idle or wasteful housewife, who has a contempt for small savings, or is perhaps merely ignorant.

The growing habit of buying immature things out of season is strongly to be condemned. What is in season is always best, as well as cheapest. Spring chickens in February are not nearly as good value as a portly boiling hen; nor are shoots of asparagus at Christmas-time nearly as savoury as brussels sprouts. Forced fruit or forced vegetables have not the flavour of those eaten in their season, and at the same time they are ten times as expensive. This applies even to flowers for decoration. Christmas roses are more appropriate to December than roses or carnations at double the cost, and it is generally only a tone of display or the competition of wealth which suggests their use. Costly things should never be used for ephemeral decorations. There are a thousand ways of making a room or a table look pretty which are overlooked in the wish to find something out of the common and therefore expensive.

A great deal of waste arises from ignorance and carelessness in storing materials after purchase. Milk is left in a hot kitchen (and very often in a not scrupulously clean jug) until it becomes sour and has to be thrown away; butter is left to melt under the same conditions; cheese is forgotten and becomes mouldy; bread grows musty and useless; and yet all scraps used with care and discrimination can help towards the feeding and comfort of a family, and make a very appreciable reduction in weekly bills. Bread, if grated when it becomes stale and put away in a tin box, is useful in various ways; the last scraps of cheese can be scraped over cauliflower or macaroni, or can be used in savouries; at the worst, they can go into the stock-pot, and thus form the nucleus of a great national institution. And until our stock-pots are familiar to us as household words we may be great and good women, but we can never be good housekeepers. Few of us at our best could equal a Norwegian maid I met who had made to-day's soup out of yesterday's sandwiches and the water in which she had boiled peas, thickened with rice!

All household books should be paid weekly. There is no doubt that monthly payments create dishonesty; small items are slipped in by dishonest tradesmen which would have been at once noticed in the weekly book, but about which we cannot feel quite certain at the end of a month. Slips of paper with the weight of the meat should be insisted on with each joint, and these should be kept and compared with the book. In the same way it is advisable to let the milkman write daily in *your* book the amount of milk left; if not, it has a mysterious way of mounting up.

Carefulness in a mistress is not only the best policy for her own pocket, but is a direct duty, as it makes petty peculations and more obvious dishonesty impossible. Therefore she should allow

no perquisites; nothing that is wanted for the family should be a perquisite for the cook. Dripping should be used for cakes and pastry; bones should go into the stock-pot; dregs of wine from the decanters should be kept for flavouring jellies; fat can be clarified and reclarified, and so be made to last twice as long. Even calcined bones as well as soot are good for rose-trees; and anything that is really over, and is of use, can be given to those poorer than ourselves.

In the kitchen, the cook is the only person who can really prevent waste; the mistress can merely guide. There are a thousand small sources of leakage by which appreciable sums may be lost at the end of a week; but a good deal may be done by a watchful eye and tender inquiries about the remains of last night's dinner! Even competent servants have very seldom any interest in true economy. It is extraordinary how differently we see things when they touch ourselves; so it is only the mistress who has an eye for these small leakages. The average maid dislikes petty economies, having been brought up in the small, wasteful houses of the poor. This is not penuriousness, however; it is thrift, a totally different thing. It is better to save than waste, it is better to use than sell or allow others to sell, and the woman who 'looks well to the ways of her household' has more to give.

Many people are really wasteful from this tiresome fear of being thought *stingy*—it is such an odious word, and it clings; but, whatever the ignorant or careless may think, it is not stingy to make the most of everything; to buy with calculation, and have all we buy ready stored for use; to have little over to burn or to destroy; to be comfortable ourselves and make those dependent on us comfortable too.

Waste and loss is incurred by not looking after our furniture and having it thoroughly cleaned and polished. Oak and walnut suffer very much if neglected, and whereas it is comparatively easy to keep things in good order by weekly rubbing and scrubbing, there comes a moment when, if they are too long neglected, it is necessary to call in outside help and go through the expensive process of French-polishing. It is a good thing to keep an underfelt or even an old blanket under the dining-room tablecloth when there are likely to be hot dishes in use, because the mark left on polished wood by heat is ineradicable. Boiled linseed-oil well rubbed in is an excellent lubricant for dry, unpolished wood, and gradually darkens it without stain or varnish. The little worm found in old oak, which bores tiny holes and leaves a mass of dust in its track, is extremely difficult to kill or cure, and it manages to spread itself to other pieces of furniture with startling rapidity. Kerosene-oil is the best means of getting rid of this trouble; but when once a piece of the furniture is fairly rotten it is almost impossible of cure, and for the sake of the rest it is really best to get rid of it at once.

Once a year the whole house should be carefully gone over and mended up, and picture-frames rubbed and polished with oil and a soft cloth; oil-paintings should be washed with soap and water; and the glasses of water-colour pictures should be thoroughly cleaned with spirits of wine and finally polished with a chamois. This is rather tiring, and takes some time; but it is quite worth the trouble. It is even sometimes necessary to take the pictures out of their frames, clean the mounts, and then repaste a strong brown paper over the back. It is *always* necessary to look at wires and cords, which have an extraordinary way of wearing through unnoticed. Mattresses should be patiently examined, beaten, and mended; the same with carpets. A darn done in time may allow a carpet to wear a year longer; but, as a rule, directly a darn is necessary in a carpet it is a signal for beginning to save up for a new one. Old blankets can be dyed and used as bath-rugs if there are no actual holes, or they can be stitched together and button-holed round with coarse wool, and start on a new career as an underblanket. They can also be dyed, and embroidered in some bold design in wool, and used as a curtain between doors or in front of a hanging cupboard. In fact, the uses of an old blanket, like the uses of adversity, are sweet, and I could make a dozen more suggestions if I had room.

Furs and duvets and extra blankets should always be put carefully away in the spring. They should be buttoned into old pillow-cases or bags made of sheeting, with a good piece of camphor, and shut up in air-tight boxes, after first being subject to careful inspection and a good brushing, to remove any chance of moth. It is so disappointing to find in the autumn that we have carefully packed up the moth in the pillow-cases with our furs!

Out of old linen sheets and tablecloths bandages should be made, rolled, and put away in the medicine-chest, and the surplus given to the hospitals, where there is always a great demand for old, soft linen. Some bits of cotton and muslin should also be kept for linseed or mustard poultices, as it is so difficult to find such things at the moment they are wanted, and many a good handkerchief has been sacrificed to a moment of forgetfulness. And here we are reminded that it is true economy to keep other simple remedies at hand, with a clinical thermometer and a medicine-glass. Every mistress of a house knows best what her own family needs; but listrine, camphor, glycerine, ammoniated quinine, nitre, mustard-leaves, and plaster are very handy, and save many a mad rush to the chemist or doctor. Another necessary for family use is the string-and-paper bag. The folding and smoothing out of paper, and the undoing of knots, become almost mechanical, and a great saving is really effected by it. But in a family of young people it is also very useful to keep a receptacle for *half-sheets* of note-paper and pieces of old pencils; otherwise the

wear and tear of one's writing-paper is tremendously increased, especially in a family where paper-games are the fashion.

Long muslin curtains will cut up into short blinds; but for use on the sunny side of a house these are not very long-lived, and tussore or cream silk, or turkey cotton, is really more serviceable, even if it has to be bought new. Old cretonne covers can be used up as dusters, but should be hemmed, as they are then treated more respectfully. Old damask cloths, or even table-napkins, can be cut into fish-napkins or small tray-cloths; but weekly mendings and darnings will ward off this inevitable fate for a long time.

The truly thrifty should lay aside a small sum every year for the renewal of household linen. It *does* seem almost hopeless sometimes when one has, at the same time, to cope with current breakages and ordinary wear and tear; but the finding of even a solitary pound at the end of the year which can be spent on the linen cupboard is not to be despised. It will buy a tablecloth, or a dozen serviettes, or a dozen towels or dusters, or kitchen tablecloths—which is something.

And here let me speak of sales. Let us be brave and face the jeers of the other sex, and allow, once for all, that a genuine sale at a good shop is a most enjoyable entertainment, and very economical for any one who has strength of mind to go list in hand and stick to it! 'Oddments' are very useful to the thrifty housekeeper. Odd towels, odd napkins, odd linen of all sorts, are often sold very cheaply at these yearly stocktaking sales, and one's linen-cupboard benefits enormously. Do not, on the other hand, keep things for keeping's sake! It is sometimes more important to have their room than their company, and though it is often a wrench to part with anything before it has been kept for the proverbial seven years, I am sure that it is often best. Old hats, unfashionable or unsuitable garments, railway-stall books which have beguiled a journey and done their work, are simply cumberers of the ground. Some one will be glad to have them; and having weeded out all that can possibly be useful to ourselves within a reasonable time, let us be brave and give or throw away the rest. It certainly will not be wasteful to do so. Linings, braid, buttons, or useful bits of stuff should be rolled up and laid by in a special place. It is wasteful to buy a piece of braid for a dress and to find next day exactly what we want carefully put away in some unexpected corner. Such things should always be get-at-able, and always kept in the same drawer or box.

Moral cowardice is another cause of waste, for it is apt to make us live beyond our means. We feel it necessary to give the same class of entertainment as our richer neighbours, and are always struggling to keep in touch with our advancing bills. Even those who have the same incomes as ourselves are not invariably trustworthy guides. Our neighbour may choose to entertain lavishly, but at the same time he may retrench in other ways. He may not take in a daily paper, he may not care about dress, he may not subscribe to a book club, all of which we may be struggling to do, handicapped by the longing to be, or to appear, as hospitable as he is. Real hospitality is quite independent of lavish expenditure. It does not waste itself on ephemeral decoration, or try to keep pace with incomes double its own.

Last, and most important of all, in any question of household waste is the waste of *time*. The ten minutes lost at breakfast-time by late rising or dawdling ways is never caught up all day, and is still missing when the front door is locked at night. Haste, neglect, incompetence, follow in its train, and from first to last the household is disorganised. But this must not be confounded with the calls of love or duty which may tear many a ten minutes out of a well-ordered, methodical day. We must never be so welded into a groove that such calls find no response, or only the fretful exclamation, 'Oh, bother!' If we neglect to answer such calls on our time, however inconvenient, however tiresome and aggravating at the moment, we may certainly become most excellent housewives, but we shall never be good or great women.

ANTOINE MARCOURT & COMPANY.

CHAPTER II.

BY four o'clock the next morning we were on our way.

The same brother looked through the *grille;* but the jovial, happy smile of the previous day had disappeared for a very uneasy, apprehensive glance. Colonel Ferrières had a rare sense of humour, and in almost a sad voice he told the prior, who quickly appeared on the scene, that, although the pictures which the novice had painted were undoubtedly very poor, still he was going to take them. The prior saw at once that it was no good attempting to tell any falsehoods. 'You must have learnt this from Cavalletti,' he exclaimed, 'that'——

'We have not come here to talk,' interposed the colonel sharply; and in a very short time all the apparent daubs were in two wagons we had brought with us. 'Now we are going to see if we can find any treasure,' remarked our commander.

'You may search where you like,' said the subprior, for his superior, in horror, had taken his departure.

The monastery was built on very much the same

plan as the famous Certoza near Milan—a quadrangle with open cloisters, and the cells of the monks opening into the cloisters, with garden in the centre. Without a moment's hesitation, following Dangani's instructions, we made our way to the last cell on the right, some of the brethren following, emphatically declaring they had not a peseta in the world.

'You had better not go in there,' said the sub-prior as we arrived at the cell. 'I entreat you not to run any risk; that is occupied by one who, alas! has a deadly fever.'

'That's of no consequence,' said the colonel.—'Lebrune,' he continued, with a laugh to the medicine-major, 'there will be an interesting case for you.'

Within we found a remarkably healthy-looking brother in bed, apparently fast asleep. Strangely enough, though he was said to be so ill, there were no medicine-bottles to be seen. The surgeon remarked on that.

This gave the sub-prior a chance of relieving his anger at the former's expense. 'No, we do not use medicines, because *Dios es el que sana, sed el medico leva la plata*' ('It is God that cures, but the doctor takes the money').

In the most polite manner the colonel ordered the patient to get up, and after removing the bed, under the tiles which were loose we found an iron chest containing nearly fourteen thousand pesetas. Of these, I may add, ten thousand were given to the troopers of the regiment, and the rest to Alexandro Dangani. Without doubt the monks had other chests hidden away, for it was not likely they would have put all their eggs in one basket; but our commander was anxious to get back, so we set off at once. As soon as we arrived at the village, while the men and horses were having their well-earned meal, we commenced choosing the pictures according to rank; the field-officers and the medicine-major, whose real rank was equal to a colonel, taking two, while we subalterns got one each. Dangani, before we began, had whispered to me, if I got the chance, to take a small Bellini. Of course, every one asked his advice, as he was the only one who really knew what was underneath; but he purposely put them off the Bellini, which I secured. Highly pleased, I was talking in the little street with the medicine-major and some comrades ere we had our *déjeuner*, when a man with some oranges to sell came and stood near us.

'What does that fellow want,' said the major, 'hovering about here? *Ma foi!* perhaps it's Rico.'

All eyes were turned on him at once.

'Oranges, señors,' he said, advancing towards us. 'They are fine, very fine.'

'Move on,' said the surgeon curtly; but the man came close up to me, holding an orange for my inspection. 'I have a letter from Colonel Lavigny,' he said in a low voice, still showing his oranges in his basket. 'I dare not give it to you here, with so many about.'

I took in the situation in a moment. 'They are fine oranges,' I said in a loud voice. 'I will take some. Bring them to the *fonda*.'

The letter to the colonel came from Londa, and was written in German for additional safety, and ran as follows: 'We have done a great deal of "business," and are off. You had better follow us as quickly as possible. Etsuch is only five leagues off. Reward bearer if you get this before night.'

'Etsuch—Etsuch! Who on earth is he?' exclaimed Colonel Ferrières. We were all as puzzled as our chief. We questioned the man, but he could not help us. Some thought it was a trap of Rico's; but as the letter was written in German, and few monks could write any language but their own, and sometimes hardly that, there was no reason to doubt it was genuine.

'I will tell you, Ferrières,' suddenly exclaimed the senior major. 'Etsuch is Suchet, the syllables being transposed.'

Had a bomb fallen among us it could hardly have caused more consternation, for Suchet was the only Maréchal who had clean hands as regarded pillage. At once we knew that if he found us all our loot would disappear as a dream. Though we officers had had no meal since the morning, the *bout-selle* at once rang out. Dangani and his wife were hurriedly placed in a forage-cart, and we were off within ten minutes of receiving the note. The worst of it was that we had not the faintest idea in what direction Suchet's division could be. We were grateful to Lavigny for giving us warning that the Maréchal was in the vicinity, but we all felt that he might have given us some hint as to the quarter in which we were to look for him, as there was every chance of our getting, as the Spaniards say, 'out of the frying-pan into the fire.' We had, however, not been in Spain for three years for nothing, and we took the very greatest precautions. Although we had our most reliable men as videttes, and they entered keenly into their work—for they knew that Suchet would make them restore the ten thousand francs that had been distributed among them—still, our colonel got so uneasy and so nervous that he sent me and other officers also in advance and on either flank to scan the horizon continually with our glasses.

For my part, though I dreaded the chance of falling in with the Maréchal's corps as much as any one, I could not help smiling at the idea of our being thus frightened, when in an enemy's country, of actually coming into contact with our own comrades. However, we duly arrived at Londa. There we learnt that Lavigny had left at five that very morning; thus he had twelve hours' start. Still, as artillery and infantry could not march as quickly as we could, we set off again with the hope of catching them up ere we entered the last and most dangerous passes of the Pyrenees, passes and ravines where infantry would be so useful.

For two days we followed their track, and had

every reason to believe we were gaining on them, when between Organa and Urgel we lost all trace of them.

We had arranged to go *viâ* Andorra; in fact, we had no idea there was any other route, so we came to the conclusion that Lavigny, knowing that there was some very dangerous country to go through, and that the guerillas had confederates in Urgel, had made a detour. Accordingly, following his example, we skirted that place in the night, and on the evening of the next day halted for the night at the entrance to a long and winding pass known from its dangerous character as the Devil's Pass.

'It's a confounded nuisance,' said the colonel. 'It would be a terrible misfortune, after all our trouble, to lose our pictures. I know this pass. I went through it with Augereau. I was in the Hussars then, but we had plenty of infantry. If we don't have trouble now, those guerillas are bigger fools than I take them to be;' and he went on to swear at Lavigny for leaving us in the lurch. The bulk of us, however, did not share our chief's gloomy views. The monks were fine cooks, and, moreover, had a fine cellar, and we lived like fighting-cocks. All this, coupled with the fact that we reckoned we should perhaps be in France the next day, put us in rattling high spirits.

At the suggestion of the medicine-major, we informed our kind hosts the next morning that we should require some of them to accompany the squadron. We thought this rather a clever arrangement, and that the guerillas would never dare to hurl down boulders or fire if the monks were with us; but, as will be seen, these rogues were not influenced by their presence in the least.

We started at daybreak. It was a lovely May morning; but we were in such a high altitude that the peaks of the purple mountains were still capped with snow, so at that hour it was very cold. The narrow road was on the right-hand side of the pass, and was virtually on the side of a precipice. Ere we entered it, the colonel hesitated whether he should dismount some of the men and send them up on either flank to dislodge any guerillas that might be there. As it turned out, this is what he ought to have done. But the practical difficulties to men in our branch of the service—their jack-boots, &c.—were so great, for the sides of this infernal pass were as steep as a wall, to say nothing of the time it would have taken, that he decided at last to press on and take the risk. He was wrong, as it turned out; but nine men out of ten would have acted as he did, and no one blamed him for our subsequent misfortunes. The orders were that we were to advance at the trot in single file; and at the first sign of danger the men were to dismount, and every other man to hold the horse of his comrade, thus leaving him free to return the fire of the guerillas. My squadron was in advance; the colonel, with the pictures, in the centre of the column.

We had reached the summit of the pass. I scanned every crag, but I could detect among them no sign of life. All was still but for the soft, distant murmur of the stream beneath us. So soothing was this that for a moment my thoughts turned to the trout that probably swarmed in it, and what pleasure a fisherman might have down there. I almost came to believe that the colonel's fears were baseless.

Mounted on donkeys immediately in front of me I had two of the monks, and a very droll-looking pair they were. One was an enormously fat man, so much so that his donkey was almost hidden by his cloak, and one could only just see the animal's little feet as it pattered along; and equally comical was his companion, who rode behind him—he was so tall that his feet almost touched the ground. I was quietly smiling to myself as I watched these strange figures, when the winding, narrow road took a sharp turn. On ahead the side of the path was not so steep, and suddenly I saw a head appear, and behind it another figure arose, peering over the rocks, evidently intently watching our videttes. This latter fellow, apparently being satisfied with what he saw, took a red handkerchief from his head and commenced waving it to some one on the opposite side.

'*Halte!* Dismount!' I cried, for I reckoned we were just entering an ambuscade, little dreaming that we were in the middle of one.

'Give me your carbine,' I said to a trooper who was holding my horse.

The first man I had seen had now risen and was kneeling with his gun covering our videttes. I knew, and hardly liked, the responsibility of commencing the action; still, I took the risk, and fired. I missed the man I aimed at, but I wounded the other. The echo of my carbine had hardly died away when from above came an avalanche of boulders upon us. Perhaps because they had not understood the order, or because they thought it did not apply to them, the two monks had remained on their donkeys, and in a moment a huge rock caught the mount of the very stout one, taking it clean off its legs and sending him and the wretched animal crashing down to instant death in the torrent beneath. For a few moments all was confusion, the men cursing and swearing, and the horses kicking and plunging; in fact, some of the latter, becoming frantic with fear, broke from those who were holding them, and three or four went over the side, in one case dragging a trooper (who had his arm through the reins of one and was holding another) along with him, though luckily the man was saved by falling on a ridge and holding on to a shrub. Though this torrent of stones was alarming at first, we soon found that there must providentially have been a ridge just above us, for by far the greater part of the rocks fell on it and went bounding off over the road into the stream, and by keeping close to the side we found we were fairly safe. But as if these falling rocks were not bad enough, from every rock and crag on the other

side our hitherto hidden foes opened a galling fire upon us.

'*Courage, mes enfants!*' I shouted, my spirits rising with the danger. 'Keep close to the side. Fire slowly; pick out your men;' and, to set an example, I took the carbine of a young conscript who had lost his horse, and who with an ashen face was cowering against the side of the road along with the tall monk, who was on his knees imploring all the saints in the calendar to protect him. There were three guerillas just opposite me, one with a gaudy sash, apparently a leader, and I resolved to bring this fellow down if I could. Resting my arm on the monk's patient donkey, as I looked down the barrel I saw he was aiming at me. His was a good shot, for it struck the top of my helmet; but I hit him in the shoulder. His companion had fired at me too, and his was really a better shot than the other's, for it was buried in the saddle of the donkey. The effect, however, of my shot on his leader was enough for this rogue, and, without loading, he commenced to scramble up to a safer place. I feared he would get out of range ere I could get another shot; but the conscript just handed me the weapon in time, and as the man was pulling himself up on to a ridge I sent a bullet into his spine, and he fell, dropping down into the stream. The appetite truly comes with the eating. I was delighted with my success; it was the best day's work I had had for a long time; for, with three shots, I had wounded two and settled one. Then I turned my attention to the third man, whose legs I could see as he lay flat behind a rock, but my hand seemed to lose its cunning, for it was not till I had four tries that I hit him. The sharp, exhilarating crackle of the carbines was now continuous all along the line. We were losing men and horses, but we were giving as good as we got. Then the shower of rocks and boulders gradually lessened, and we heard the welcome sound of our carbines above us, and we knew then that the colonel had got some men up on the flank of those behind us, and they soon made the rogues desist from their cowardly work; and, having done that, they opened fire on those who were opposite to us. Under cover of this fire the order came up the ranks for us to continue our route on foot.

The tall monk, who had been peppered by some buckshot, had now from praying turned to swearing, and so we left him, and in a short time were out of all danger. The other end of the pass opened on to a fertile valley, and there we halted. Our losses amounted to three killed and nearly twenty wounded, and the death of a dozen horses; but we had saved our pictures, and to our certain knowledge our foes, with all their advantages, had suffered far more than ourselves. Still, for all that, our colonel was so exasperated at the attack upon us that he burnt the first village we came to. Owing to this *contretemps* we proceeded no farther that day. Early the next morning we breasted the summit of the last range, and, to our unutterable joy, we saw in the far distance our beloved France. So elated were we that, thinking all danger was now past, we gave the monks permission to return. We had hardly done so when we espied through our glasses a small group of horsemen approaching. Their leader, we perceived from his *panache*, was an aide-de-camp, and he belonged to the Red Polish Lancers.

'That's good,' said the colonel gaily. 'Now, perhaps, we shall hear some news of the Emperor, and we may also hear something of Lavigny.'

We were destined to hear rather more than we wanted.

'No,' said the aide-de-camp, after he had asked some questions about the state of the roads, &c., and where he was likely to find Maréchal Suchet—'no, I have seen nothing of Lavigny; in fact, if he has done as much "business" as you say, he would hardly be such a fool as to come this way.'

Our wagons containing the pictures, &c., were in the middle of the column, so that the Lancer had not yet seen them, and apparently thought that we had got no loot.

'Whatever do you mean?' exclaimed Colonel Ferrières, aghast.

'Why, have you not heard of the Emperor's orders against pillaging? He is determined to put a stop to it. He says he will no longer have his army disgraced in the eyes of Europe. They have got a name for being nothing but bodies of marauding thieves. You will find General Provost-Marshal Gosselin awaiting you at the frontier. I suppose Lavigny has got scent of it, and has gone round by another way. But, adieu! I must get forward.' And, followed by his strong escort, he left us ere we had fully realised his communication.

As for the colonel, taking off his casque and wiping the perspiration from his forehead, he seemed for a minute or two perfectly dumfounded. We, too, looked at each other, hardly knowing whether to laugh or to swear.

'Whatever shall we do?' at length said our chief with an oath, glaring at us with impotent rage, as though it was our fault. Giving the order to dismount, he called the officers together. 'Every man,' says a characteristic Spanish proverb, 'has his own way of catching fleas,' and countless were the suggestions made. There are few men who have not got their price; therefore most suggested that one of us should ride forward and see the Provost-Marshal, and sound him as to what figure he would want to allow us to go through; but our senior *chef d'escadron* said he had served under General Gosselin, and that the man who tried that plan on him would regret it to the end of his days. The Emperor knew his character for integrity, and that was why he had appointed him.

Of all the suggestions, that of the medicine-major was far and away the best. 'I speak with diffidence, *mon colonel*,' he said, 'as I am not strictly a soldier; but, I say, let us go back a day's march. Ransack every church and convent in the district.

Never mind what rubbish we get. In fact, we are not likely to get anything else, as Augereau went over this ground years ago; but let us fill as many wagons as we can, and then ride down boldly to the frontier, and pretend to be horrified and surprised when they are seized. But ere we start we will take our real pictures from their frames, and have a double bottom made to the cart containing the wounded and put them in it. The sham ones will be seized, and of course we shall growl and grumble; but,' he continued with a twinkle in his eye, 'that won't matter.'

This plan of the surgeon's was greeted with acclamation, the horses' heads were turned, and we never drew bridle till we had gone a couple of leagues. The whole of the next day we scoured the country, and by the evening I doubt if a greater amount of artistic rubbish had ever been brought together. In the meanwhile the medicine-major got a carpenter to make a false bottom to the largest wagon, explaining to the man that by placing hay underneath it he hoped to reduce the jolting that caused so much suffering to the wounded. Very early the next morning, almost before it was light, we commenced operations. Some inferior vestments were placed on the floor of the cart; then some magnificent copes and chasubles so stiff with gold that they could nearly stand up of themselves; and then upon these we placed our old Spanish and Italian masterpieces, which we had taken from their frames. Then, as an additional protection from damp, some more vestments of a commoner sort were put on the top. The false floor was then fastened over them, with a quantity of hay upon it. The wounded were placed in one wagon, and Dangani, his wife, and our *vivandière* in the other, and once more we set off. My Bellini was so small that I had it rolled up in my great cloak, so that, in case our *coup* did not come off, I reckoned at any rate I should have saved something from the wreck. But with all our precautions, I frankly admit that as we approached the frontier it was not without a qualm of uneasiness that I looked back now and then at the wagons that contained my artistic treasures. The handsome, dare-devil countenance of our chief, too, had such an anxious look upon it that in ordinary circumstances it would have made me smile.

At last we saw the little hamlet in front, and our own familiar *douaniers* awaiting us, and, what was more, a strong picket of soldiers. With our wagons of loot placed ostentatiously in front, we now rode boldly forward.

'*Halte là!*' cried the sergeant. 'You have got some loot there.'

'Of course we have. What of that? We would have had more if we could,' said Colonel Ferrières.

'Well, those wagons can't pass, sir,' said the sergeant, and he sent a man to inform the General Provost-Marshal.

The latter, after keeping us some time, instead of sending for the colonel chose to come out himself to see what we really had got. He told our commander curtly that the wagons must be left behind, and that they would be sent to Paris, according to the Emperor's orders.

If Colonel Ferrières had not been a soldier he would have made, I am certain, a splendid actor. Talma himself could not have shown greater surprise at this announcement. 'But, *mon Général, mon Général,*' he exclaimed, aghast, 'there surely must be some mistake. I received no such orders from General Foy. Why, the Emperor's own brother took forty wagons of plate when he left Madrid. For three years we have fought and bled for our country. If,' he continued in an almost imploring voice, 'the Emperor only knew that his children'——

'I am not sent here to argue,' replied the other brusquely, 'but to carry out the Emperor's commands;' and thereupon he ordered the wagons to be taken away.

'As a matter of fact, sir,' said our chief, 'some of these pictures are hardly worth taking.'

'That's nothing to do with it. They will be forwarded to Paris. It is for M. le Conservateur of the Musée du Louvre to decide that point.'

When I heard this, and thought of the utter rubbish in the wagons, I could hardly keep my countenance; in fact, to hide my face I bent down over my saddle and pretended to alter a hole in the stirrup-leather, and even then I thought I should fall off with suppressed laughter. But my laughter ceased, and uncommonly quickly too, as the General continued in a hard and rather ironical tone:

'You say that the pictures are hardly worth having. You were with Colonel Lavigny, were you not?'

'Yes, sir,' replied Ferrières uneasily.

'And you two arranged to get into France by different routes?'

'No, *mon Général,* I swear we did not,' replied the colonel, who was now as white as a sheet.

'Well, anyway, Lavigny went round by Belver and Piguicerda, and we have just caught him at Porta, and I am told his pictures were extremely fine.'

'You see, he was my senior,' said the ready-witted Ferrières, 'and he took all the best ones.'

'Are you going to make a halt here?' asked the General abruptly.

'There is really no need, sir,' replied Ferrières, 'unless you order me to do so. The men have had their *soupe* only an hour ago, and we were told to go to the depôt as quickly as possible. The memories of this place, *mon Général,* are not of the most agreeable. I shall never forget them,' he concluded in a deeply aggrieved tone.

'I do not order you to halt. I have nothing to do with your military movements—*ça m'est égal,*' he replied curtly, and, turning on his heel, with some of his officers walked away.

(*To be continued.*)

THE THREEFOLD VICTORY IN ROSLIN GLEN.

PART II.

IMAGINATION can hardly exaggerate the exhaustion which now overtook the conquering Scots as the tide of war rolled back and left them a space to regard their wounds and to recall the prolonged exertions of the night-long scramble over the heathery hills in the murky darkness, and the toil of the double victory gained within the few hours before noon. Many threw themselves down to quench their thirst in the waters of the stream,

> But in abhorrence backward drew;
> For, oozing from the mountain-side,
> Where raged the war, a dark-red tide
> Was curdling in the streamlet blue.*

Many sought the knolls of the rising ground to cool and refresh themselves in the snell February breeze, while others, particularly from the band of attendants, who had taken no active part in the fighting, sought to enrich themselves with the spoils of the fallen.

Suddenly warning horn-blasts and cries of alarm from the advance-posts sent out from the Scots army warned the weary warriors that their labours were not yet at an end; and soon it became apparent that, although their enemies had been twice defeated that day, there were still many thousands of them who had taken no part in the fray, and were now securing posts of vantage in front and on the flanks of the Scots army, bent on redeeming the fortunes of the day. This third division of the invaders, reinforced by many of the fugitives from the other columns which had been dispersed, now approached from the direction of Lasswade, and displayed their standards on the banks of the Esk. Maddened at the news of the disasters which had befallen the armies of Sir John Segrave and the Cofferer, the men under the command of Sir Robert Neville—famous as an intrepid soldier in the Welsh campaigns—advanced hotly upon the opposing lines of Scots, who had numbered at first but eight thousand combatants, but were now sadly reduced in strength, while the attacking force was rapidly increasing, and already far outnumbered and outflanked the defending army. Defeat appeared impending, for besides the overwhelming force bearing straight for the weak and scattered circles of Scottish spearmen, there were in the rear hundreds of prisoners who were eagerly watching the approach of 'proud Edward's power' and waiting only for the first successful attack to turn upon the captors and add to the already overwhelming odds against the defenders. Need we be surprised if the tradition were true that at this supreme moment of desperate exhaustion and fresh anxiety for the fate of their native country, the Scots leaders resolved again to sacrifice such of their prisoners as were likely to give trouble when the combatants had closed in deadly conflict? For such is the record given by the Scots chronicles, being in accordance with the practice of the time.

As the hour of the winter sunset approached, the Scots leaders perceived that many of their followers were in no fit condition, from weariness and hunger, to continue the contest. But Sir Simon and the Red Comyn, undaunted by the black cloud of adversity which appeared to envelop them, passed from group to group, reminding the men of the terrors of the English domination, and denouncing the cowardice of any man who, for the sake of his own ease at this moment, would throw away for ever from his countrymen the blessing of freedom, which they extolled almost in the words of Barbour:

> Ah, freedom is a noble thing!
> Freedom all solace to man gives.
> He lives at ease who freely lives.
> A noble heart may have none ease,
> And should think freedom more to prize
> Than all the gold in world that is.

Roused by the unflinching courage of their leaders, and fired to action by their noble words, the Scots army responded with loud shouts, which told their captains that they could securely rely upon their men to do or die for their country. Scarcely had the clamour ceased when from the wooded slopes of the Dryden stream a dense flight of clothyard arrows fell upon the circles or sheltrons of Scottish spearmen, bringing wounds and death to many. Following close upon this first attack, the crashing and crackling of brushwood and the wild swaying of the undergrowth in front and on flank told that a desperate onset had begun. The Scots, who always preferred a hand-to-hand contest to the deadly distant conflict of the bow, braced themselves for the fray, and no sooner had the head of the column ventured into the open ground beside the stream than, with impetuous rush, the swordsmen and spearmen fell upon them, and with almost demoniac strength, born of their frenzied determination to preserve their freedom, the Scots clove their way up the opposing bank into the heart of the enemy.

> Scarce swifter shoots the bolt from heaven
> Than came the Scottish band;
> Right up against the guarded trench,
> And o'er it, sword in hand.

How often in history has this tale been told! When roused to white-heat by patriotic fervour, what people have been able to withstand 'the sweep of Scotland's broad claymore' in the death-grip of hand-to-hand encounter?

No sooner was this terrific counter-stroke de-

* *Marmion.*

livered, and the enemy hurled back from the Scottish side of the stream, than another and yet another onset, heralded by a death-dealing shower of bolts and arrows, followed, till the slopes on which the defenders were arrayed presented the appearance of a forest over which a tornado has passed, leaving the giant trunks heaped in wild disorder in its track.*

These attacks of the invaders, begun and repeated time after time with the utmost impetuosity, ultimately slackened in intensity as evening approached, and it became more and more borne in upon Sir Robert Neville that he must retire, as his army, composed for the greater part of mounted men-at-arms, was no match, in the broken and marshy country which lay between the two armies, for the agile, light-armed footmen of the Scots force.

> But as they left the darkening heath,
> More desperate grew the strife of death.
> The English shafts in volleys hailed,
> In headlong charge their horse assailed;
> Front, flank, and rear, the squadrons sweep
> To break the Scottish circle deep.
> Unbroken was the ring.

The chroniclers tell us that at times whole companies of the Scots, feeling overcome with fatigue and almost prostrated with the severe strain of the last twenty-four hours, drew off by twenties and forties to the highest ground around, where they threw aside their arms and such defensive mail as they might be wearing, and sought to cool and refresh themselves on the grassy slopes. After a short period of rest they returned to the conflict or proceeded to keep watch over the more accessible portions of the line of defence, ready to sound the alarm on the approach of each new hostile line of attack.

It was well that darkness now fell upon the fray, for sheer and utter exhaustion had seized the combatants, and the dire events which were to be enacted were better shrouded in the gray and misty glamour of the winter evening than in the pale moonlight which later flooded the ghastly scene.

Scarce had the order been given by Sir Robert Neville to his men to withdraw from the contest and retreat from the field than the Scots captains, having armed the attendants with the weapons of the fallen and of the prisoners, and, 'having given to every Scot living a weapon,' sent them, headed by their mounted force, in pursuit. Tradition tells that many of the English sought to escape by the open ground along the cliff-like banks of the flooded Esk in the hope of finding a ford. But this route proved but a trap. For the level ground ends abruptly in a circular high bank covered with trees and brushwood, which the flying troops found it impossible in the gathering darkness to ascend on horseback, while the undergrowth was so dense that they could scarce penetrate it on foot; and ere a ford was found the Scottish spearmen were among them. The poet's description of the spot, and of the view over the Esk to Hawthornden, helps us to picture the scene:

> The spot is wild, the banks are steep,
> With eglantine and hawthorn blossomed o'er,
> Lychnis and daffodils and harebells blue,
> With lofty granite crags precipitous.
> The oak with scanty footing topples o'er,
> Tossing his limbs to heaven, and from the cleft
> Fringing the dark-brown natural battlements
> The hazel throws his silvery branches down;
> Then starting into view a castled cliff,
> Whose roof is lichened o'er purple and green,
> O'erhangs thy wandering stream, romantic Esk,
> And rears its head among the ancient trees.

The massacre which followed has given to the spot the grim title of 'The Hewing' to this day; and history records that the Esk river ran red with blood for days, and where the flooded stream entered the Forth, at the Links of Musselburgh, the 'multitudinous seas incarnadine' dyed crimson the sands of the bay. Twelve thousand English lay dead upon the field, and many more left their bones to bleach in hidden brake and rocky gulley, where they sought their last bed and slept in peace, far from the clash of arms.

Of this great threefold conflict, contemporary historians, both English and Scots, have written with profound admiration. Thus, the envoys of Scotland, then at the Court of King Philip le Bel of France, wrote urging their countrymen to continue the struggle. 'You would greatly rejoice if you knew what reputation you have acquired all over the world by your late conflict with the English.'

Wyntoun, who lived in the same century, in his *Cronykil* wrote:

> There was no man then living
> That ever heard or saw before,
> Intil ony kyn kynryk,
> A day's werk to that daywerk lyke.

John of Fordun also, writing in the fourteenth century, speaks of 'the great and famous engagement at Roslyn, where the English were defeated, though with great difficulty. From the beginning of the first war which ever broke out between the Scots and English, it is said there never was so desperate a struggle, or one in which the stoutness of knightly prowess shone forth so brightly.'

So also Hector Boece (1465–1536): 'This was a great victory. I do not know whether there was ever any other more famous or greater in the history of our country.'

Holinshed, although an Englishman, declared: 'The glory of the [Scots] victory was great, considering that thirty thousand Englishmen, well furnished and thoroughly appointed for war, should be thus in one day vanquished by a handful of Scottishmen. All men supposed that it came to pass by the singular favour and grace of Almighty God.'

* This spot is known to this day as 'The Graves,' and is marked by well-defined tumuli.

It has been left to our later Scots historians to belittle the work of our countrymen. Lord Hailes, in his *Annals*, bewails the sad fate of the English prisoners who fell that day; and Burton passes over the strenuous struggle with the remark that 'as the Scottish chroniclers of the battle accompany it with acts of extreme cruelty, their narrative of triumph may be abandoned without sacrifice of the national honour.' This is surely a poor epitaph to be inscribed to the memory of the 'Flower of Chivalry' and his doughty patriot-band who, 'facing fearful odds,' sought death or victory so that the rights and liberties of their country might be preserved, and that their descendants to later ages might be freed from the cruelty of oppression under which, for a generation, the whole population had groaned, and which to all Scotsmen had made life unendurable. The same 'acts of extreme cruelty' (which are not, however, alleged or complained of by the English historians of the period, and must therefore have appeared of too minor importance for notice at their hands), when perpetrated by King Edward, did not prevent Burton from describing at length the English victory when Edward captured Berwick, and slew seventeen thousand Scots* soldiers and unarmed citizens; nor are other historians prevented from narrating the bravery of the victors at Creçy simply because the Black Prince caused his prisoners to be slain.

The victory at Roslin, however, was but a flash of bright sunshine amid the dark and stormy period of the struggle; but it taught the lesson—learned in the same year at Courtrai by the Flemish weavers in their conflict with the mailed hosts of France—that with high courage and determination it was possible for the spear and billhook men to oppose successfully and to overthrow the mounted men-at-arms, hitherto considered irresistible. The lesson was not forgotten; and when King Edward, leading a motley host of Angles, Welsh, Irish, Gascons, and Savoyards, had carried fire and sword, with sacking of towns and bloodshed, to the remotest northern counties of Scotland, the very extremity of his ruthless cruelty, which he had expected would stamp out the embers of the patriotic fire, proved—as has been the case so often in Scottish history—but the immediate cause of a national uprising which drew its breath and inspiration from every class of the people. Then came the close of the period of internal class or clan jealousy, which in Scotland, as in Ireland, had been the fruitful cause of disaster in the struggle for independence. Edward's march of rapine to Caithness and the shores of the Moray Firth 'sowed the dragons' teeth' from which sprang up the unconquerable resolution of the whole Scottish people to end for ever the imperious claim of English sovereignty by conquest, and brought Robert and Edward Bruce, James Douglas, Randolph Moray, Walter the Stewart, and all the best of Scotland's ancient nobility into the field.

As in the lives of many men, so with our nation, it needed the seven times heated furnace of disaster to produce the pure gold of noblest manhood. So from the fierce religious persecution of later times came the settled determination of the Scottish people to overthrow the 'bloody House of Stuart,' which was followed by the Revolution Settlement, with the religious freedom existing to this day; and from the wanton cruelty and rapacity of the English oppressors came that final rising of the whole Scottish nation which arrayed itself on the field of Bannockburn, and, though by comparison feeble in number, overthrew one hundred thousand of their enemies in open conflict.

The lesson learned at Roslin in 1303 had been applied; and from that day till King Edward's son, in 1314, rode from the field of battle to save his life, and till his grandson, in 1328, signed the Treaty of Northampton—that charter of Scottish Independence, by which he and the Parliament of England undertook to deliver up to the Scottish people all documents and muniments 'touching the subjection of the people of Scotland to the people of England'—the Scottish patriots never wavered from their set determination to secure for their country her absolute freedom as an independent nation.

Freedom has a thousand charms to show
That slaves, howe'er contented, never know;
The mind attains beneath her happy reign
The growth that Nature meant she should attain.
And they that fight for Freedom undertake
The noblest cause mankind can have at stake;
Religion, virtue, truth, whate'er we call
A blessing, Freedom is the pledge of all.†

* Knighton, an English historian; other historians give the number of the defenders slain at eight thousand.

† Cowper.

THE WIDER VIEW.

Love stole the quiet heart I had,
And robbed me of my peace;
He brought me rue for garlanding,
Nor gave my soul surcease.

And as I wandered in the ways
My tears fell like the rain,
And peered the pale flowers through the mould
Along the track of pain.

'Alas!' I moaned, 'how bitter-sweet
To learn that Love is ruth!'
'Nay,' said my soul, 'thy pains are thorns
That fringe the path of Truth.

'Blind Love is idle, nor discerns
False issues from the true.
Say, shall I cloak thine eyes again,
And crown thee with thy rue?'

When kindly years sent wiser Love,
Patient, clear-eyed, serene,
Lo! Truth walked with him hand-in-hand,
The flowers and thorns between.

THE HUMOURS OF GUN-RUNNING.

By Louis Becke.

MY first experience of gun-running was gained at an early age, when I began life as a trader in Samoa, or, as the group was then more commonly called, the Navigators' Islands. War had broken out between King Malietoa and his adherents and the rebel chiefs of Savaii, the largest island of the group. The people of the island of Upolu—on which the port of Apia is situated, and where his brown Majesty resided—were for the most part loyal to him. But one district, which had four thousand good fighting men, upheld the rebel cause; and, making a sudden and treacherous attack whilst peace negotiations were being carried on, drove the king and his party out of the Apia district with much slaughter, and strongly entrenched themselves to the south-east and north of the town and port of Apia. Then they rested, waiting for reinforcements by sea from Savaii. This was a serious blow to Malietoa, for he was cut off from Apia, the place where he could buy arms, ammunition, and supplies. He could not gain access to the port by sea, for a fleet of rebel canoes were on the watch; neither could he obtain arms by stealth from any of the European merchants there, for all the trading-stores were watched by the rebels, then practically in possession of the town. And although a number of his warriors did enter Apia, singly or in twos or threes, and bought rifles, they never returned, being shot down by ambushed rebels as soon as they were out of the precincts of the town. Malietoa, however, entrenched himself strongly at a place called Vailele (Leaping Water), seven miles north of Apia, and played a waiting game. I may mention that the English and American residents were in favour of Malietoa, whilst the Germans openly supported the rebel party, and actually provided them with arms, taking land in payment—not their own lands, but those that were to be wrested from Malietoa and his chiefs. In fact, the war was engineered by the German Consul-General—against instructions from Berlin, however.

At this time my half-caste partner, Alan Strickland, and I were engaged in trading throughout the group in a small cutter, and doing remarkably well. We bartered coloured printed stuffs, calicoes, hardware, tobacco, and other trade-goods for copra (dried cocoa-nut) and yams. On the latter we made a large profit, for food was scarce in Apia, and both whites and natives bought them eagerly.

My partner was a stalwart young Manahiki half-caste of great resource and daring, and soon after war broke out he suggested that we should make a voyage to Tonga (Friendly Islands), where we could buy arms cheaply, and then 'run' them into Samoa at various points along the coast of Upolu. We called on the king and laid our plans before him, and he promised us every assistance, and a good price for every rifle we landed, especially Sniders and Winchesters; also, he marked off on my chart certain spots where he would have people awaiting us, provided these places had not been captured by the rebel party.

We made several voyages, and did remarkably well. Occasionally we were overhauled by the rebel war-canoes and searched; but they found nothing, for we had built a false skin all round the cutter's hold, in which the arms were stowed, and then the hold itself was usually full of copra or other cargo. Once, indeed, we were caught, and I should have been shot out of hand but for the resourcefulness of Alan's wife (a Samoan girl), who effected a ransom; but, as I am writing now only on the humours of gun-running, I need not tell the story here.

On our return from our third trip to Tonga we found that Malietoa had driven the rebels out of the Apia district, and was occupying their entrenchments; but in port were three warships—the German *Carola*, the American *Resacca*, and the British corvette *Cameleon*—who searched every incoming vessel to see if she had arms on board. A neutral zone had been defined around Apia, a

[*All Rights Reserved.*]

municipal government (backed up by the warships) had been formed, and all Europeans had been warned that the selling of arms was illegal, and would be punished by a heavy fine (even if it were but a single shot-gun) of one hundred pounds.

We had already got rid of forty rifles and five thousand rounds of ammunition, by landing them on the south side of Upolu; but when we sailed into Apia Harbour we still had on board ten Winchesters, sixteen shot-rifles, ten Winchester carbines, and a thousand cartridges for each. These rifles we wished to deliver to King Malietoa himself, for he alone had cash enough to pay for such expensive weapons. The cartridges were stowed in boxes of fifty each between the true and false skins, and the latter we had white-washed, 'to sweeten the hold.' The rifles we had hidden in an exceptionally safe place, and so felt pretty confident of pulling through all right when the time came.

Being under British colours, we were boarded by an officer from the *Cameleon* as soon as we anchored. He handed me the Arms Proclamation, and then asked me what cargo we had.

'Ten casks of molasses for Vailele cotton plantation,' I replied, 'and fifty live hogs.'

'Any arms?'

'We have these,' I replied truthfully, pointing to my own and Alan's Winchester carbines and revolvers, which were lying on the lockers.

'Ah, quite so. You are allowed to carry these for the vessel's defence; but don't be tempted to sell them, or you will repent it. But I must have a look around all the same. Sorry to trouble you, but these are my orders.'

After a somewhat perfunctory search of our small cabin had been made, we went on deck, the hatches were taken off, and the lieutenant, his coxswain, and I descended. He cast his eye around leisurely, then looked at the casks of molasses, which were lying amidships, neatly dunnaged with green banana-tree stalks to keep them in position, and asked me to 'oblige him' with a mallet and a straight bit of stick about four feet in length. They were produced.

'Start the bungs of some of these casks, Smith,' said the officer.

The coxswain started the bungs of four of the casks, and then probed each cask in turn, fore and aft, and along the bilges, drawing out each time dripping black, odorous molasses.

'That will do, Smith,' said the officer. Then turning to me, 'Who on earth can swallow such awful stuff as that?' he asked.

I explained that, with boiled rice, it formed part of the rations given to the Kanaka labourers on sugar-plantations.

When we returned to the deck the officer told me that if I wished to sell ten or a dozen hogs, I should get a good price for them from the corvette.

Now, Alan and I wanted the hogs for a special purpose, and I did not like selling any of them to the *Cameleon;* but I thought it best to do so, and although I asked a fancy figure for my 'piggies,' I got it. Owing to the war, fresh meat of any kind was at an extraordinary price. Food of all other kinds was also very scarce, no vessels having arrived from the colonies with supplies for a long time, and none were expected. No copra was being made; and, although there was plenty of money in Samoa, the trading captains wanted copra, not cash.

That evening we killed a hog, and sent it on shore as a present to a white trader friend of mine. In the pig's stomach were two hundred and fifty loose Winchester cartridges for Malietoa, who was hard pressed for ammunition. I also wrote the king a note telling him that I had twenty Winchesters and heaps of cartridges for him, and if he sent some of his chiefs to Vailele plantation for them (with the money) he could have them on the following day.

We lifted anchor at daylight, beat up to Vailele, and landed the casks of molasses. The manager was a friend of mine, and was 'standing in' with me over the business. Within an hour the liquid contents of five of the barrels—which had originally held American pork, and were very suitable for our purpose on account of their extreme length—had been emptied into other casks, and the rifles were being washed and cleaned.

The way Alan and I did it was this. At Tonga we had bought ten empty pork-barrels, and placing a rifle or carbine in position in each, one on the stave next the bung-hole on one side, and one on the other, we secured them by staples from the inside, filled the cask with molasses, and the matter was done. It was Alan's idea. He was, as I have said, a man of resource. Now, had that young lieutenant used a piece of *cane* instead of a stiff stick, and curved its point from the bung-hole down along the bilge, he would have found something!

Malietoa was most anxious that his adherents on the island of Savaii should obtain five thousand cartridges and ten of the rifles, so we re-shipped five casks of molasses and five thousand cartridges, and at once set sail for Matautu, the principal port of Savaii. Here we were closely watched by the rebels, who occupied the town, but who could make no objection to my selling a couple of casks of molasses to the local trader; indeed, they were glad, for all Samoans are fond of molasses. In due course the trader sent the internal fittings of the casks to the persons for whom they were intended, together with two thousand cartridges, which we dropped in through the bung-holes.

In the course of a month we returned to Apia, having got rid of the last of the molasses and cartridges at various places on the coast of Savaii. The hogs came in very usefully. Sometimes we would call at villages inhabited solely

by rebels, but the native pastor of which would be friendly to Malietoa. To him we would make a present of a freshly killed hog, stuffed with from two hundred to three hundred cartridges, like a 'lamb stuffed with pistachio nuts' of the olden time, and so we did well, and earned honest money.

During the time we were away Malietoa had driven all the rebels to the little island of Manono, which he could not attack, as it was too well fortified by stockades, and the rebels also had several cannon. However, peace was restored a few months after.

Four years later I was again in Samoa, supercargo of a Sydney trading-brig, and again found that a civil war was going on under almost similar conditions to the previous one. Provisions were scarce and arms dear. Now, we had on board a number of cases of converted Snider rifles destined for the Caroline Islands, and I determined to get them on shore at Apia in some way or another. First of all I had a secret interview with Malietoa, and then his Majesty and I 'fixed things up.'

I called upon the consuls, and informed them that I had a number of cases of rifles on board, intended for the Caroline Islands; but since leaving Sydney had learnt that the natives of those islands had attacked and wiped out one of the Spanish garrisons, that severe fighting was still going on, and that if the Spanish authorities ascertained that I had arms on board, the ship would be seized and confiscated. The consuls agreed that that was a certainty.

'Well, gentlemen,' I said, 'I don't want to lose the ship and see the inside of a Manila prison for the sake of a few cases of rifles. Now, if you will allow me to land them here, to remain under your care until I return from the Carolines three months hence, I am willing to pay one hundred and fifty dollars for the storage.' At first they refused.

'Very well, then, if you will not oblige me in this matter I shall not sell a single ounce of any kind of provisions to any white man in Samoa.'

This was a staggerer. Our vessel had a great quantity of provisions for sale, and none were to be had in Apia; so after consultation they agreed to store the arms, and I paid the hundred and fifty dollars in advance. Then the consular police-boat came off, and the cases of rifles were sealed with the joint consular seals, taken on shore, and deposited in the care of the chief of the municipal police (the government of the neutral zone of the Apia district being administered by the consuls).

We sailed shortly after, with several heavy bags of American dollars in the ship's safe; and two nights after we had left, during a heavy downpour of rain the police barracks were burgled, and the cases of rifles carried off holus-bolus. With the rifles also disappeared five native policemen. I can imagine the great rejoicing in King Malietoa's lines that night when the cases were brought in.

An American friend of mine, a fellow-supercargo, succeeded in getting a number of rifles on shore in Samoa by concealing them in cases of corrugated iron that were to form the roof of a new native church—two in every case! The cases were packed in Auckland (N.Z.). Then another man whom I knew well hit upon an excellent device for getting cartridges on shore. The Samoans are passionately fond of tinned salmon and sardines. He opened some hundreds of cases of salmon, took out each tin and partly opened it, stuck in a cartridge or two, soldered the tin again, and gave it a dab of brown paint. For this particular brand of salmon the natives were always ready to pay half-a-dollar instead of the usual quarter, and he was soon sold out.

THE HOUSE OF WHISPERS.

CHAPTER XIII.—WHAT FLOCKART FORESAW.

THE following afternoon was glaring and breathless. Gabrielle had taken Stokes, with May Spencer (a girl-friend visiting her mother), and driven the 'sixteen' over to Connachan with a message from her mother—an invitation to Lady Murie and her party to luncheon and tennis on the following day. It was three o'clock, the hour when silence is upon a summer house-party in the country. Beneath the blazing sun Glencardine lay amid its rose-gardens, its cut beech-hedges, and its bowers of greenery. The palpitating heat was terrible—the hottest day that summer.

At the end of the long, handsome drawing-room, with its pale-blue carpet and silk-covered furniture, Lady Heyburn was lolling lazily in her chair near the wide, bright steel grate, with her inseparable friend, James Flockart, standing before her.

The striped blinds outside the three long, open windows subdued the sun-glare, yet the very odour of the cut flowers in the room seemed oppressive, while without could be heard the busy hum of insect life.

The Baronet's handsome wife looked cool and comfortable in her gown of white embroidered muslin, her head thrown back upon the silken cushion, and her eyes raised to those of the man, who was idly smoking a cigarette, at her side.

'The thing grows more and more inexplicable,' he was saying to her in a low, strained voice. 'All

the inquiries I've caused to be made in London and in Paris have led to a negative result.'

'We shall only know the truth when we get a peep of those papers in Henry's safe, my dear friend,' was the woman's reply.

'And that's a pretty difficult job. You don't know where the old fellow keeps the key?'

'I only wish I did. Gabrielle knows, no doubt.'

'Then you ought to compel her to divulge,' he urged. 'Once we get hold of that key for half-an-hour, we could learn a lot.'

'A lot that would be useful to you, eh?' remarked the woman, with a meaning smile.

'And to you also,' he said. 'Couldn't we somehow watch and see where he hides the safe-key? He never has it upon him, you say.'

'It isn't on his bunch.'

'Then he must have a hiding-place for it, or it may be on his watch-chain,' remarked the man decisively. 'Get rid of all the guests as quickly as you can, Winnie. While they're about there's always a danger of eavesdroppers and of watchers.'

'I've already announced that I'm going up to Inverness next week, so within the next day or two our friends will all leave.'

'Good! Then the ground will be cleared for action,' he remarked, blowing a cloud of smoke from his lips. 'What's your decision regarding the girl?'

'The same as yours.'

'But she hates me, you know,' laughed the man in gray flannel.

'Yes; but she fears you at the same time, and with her you can do more by fear than by love.'

'True. But she's got a spirit of her own, recollect.'

'That must be broken.'

'And what about Walter?'

'Oh, as soon as he finds out the truth he'll drop her, never fear. He's already rather fond of that tall, dark girl of Dundas's. You saw her at the ball. You recollect her?'

Flockart grunted. He was assisting this woman at his side to play a desperate game. This was not, however, the first occasion on which they had acted in conjunction in matters that were not altogether honourable. There had never been any question of affection between them. The pair regarded each other from a purely business standpoint. People might gossip as much as ever they liked; but the two always congratulated themselves that they had never committed the supreme folly of falling in love with each other. The woman had married Sir Henry merely in order to obtain money and position; and this man Flockart, who for years had been her most intimate associate, had ever remained behind her, to advise and to help her.

Perhaps had the Baronet not been afflicted he would have disapproved of this constant companionship, for he would, no doubt, have overheard in society certain tittle-tattle which, though utterly unfounded, would not have been exactly pleasant. But as he was blind and never went into society, he remained in blissful ignorance, wrapped up in his mysterious 'business' and his hobbies.

Gabrielle, on her return from school, had at first accepted Flockart as her friend. It was he who took her for walks, who taught her to cast a fly, to shoot rooks, and to play the national winter game of Scotland—curling. He had in the first few months of her return home done everything in his power to attract the young girl's friendship, while at the same time her ladyship showed herself extraordinarily well disposed towards her.

Within a year, however, by reason of various remarks made by people in her presence, and on account of the cold disdain with which Lady Heyburn treated her afflicted father, vague suspicions were aroused within her, suspicions which gradually grew to hatred, until she clung to her father, and, as his eyes and ears, took up a position of open defiance towards her mother and her adventurous friend.

The situation each day grew more and more strained. Lady Heyburn was, even though of humble origin, a woman of unusual intelligence. In various quarters she had been snubbed and ridiculed, but she gradually managed in every case to get the better of her enemies. Many a man and many a woman had had bitter cause to repent their enmity towards her. They marvelled how their secrets became known to her.

They did not know the power behind her—the sinister power of that ingenious and unscrupulous man, James Flockart—the man who made it his business to know other people's secrets. Though for years he had been seized with a desire to get at the bottom of Sir Henry's private affairs, he had never succeeded. The old Baronet was essentially a recluse; he kept himself so much to himself, and was so careful that no eyes save those of his daughter should see the mysterious documents which came to him so regularly by registered post, that all Flockart's efforts and those of Lady Heyburn had been futile.

'I had another good look at the safe this morning,' the man went on presently. 'It is one of the best makes, and would resist anything, except, of course, the electric current.'

'To force it would be to put Henry on his guard,' Lady Heyburn remarked. 'If we are to know what secrets are there, and use our knowledge for our own benefit, we must open it with a key and relock it.'

'Well, Winnie, we must do something. We must both have money—that's quite evident,' he said. 'That last five hundred you gave me will stave off ruin for a week or so. But after that we must certainly be well supplied, or else there

may be revelations—well—which will be as ugly for yourself as for me.'

'I know,' she exclaimed. 'I fully realise the necessity of getting funds. The other affair, though we worked it so well, proved a miserable fiasco.'

'And very nearly gave us away into the bargain,' he declared. 'I tell you frankly, Winnie, that if we can't pay a level five thousand in three weeks' time the truth will be out, and you know what that will mean.'

He was watching her handsome face as he spoke, and he noticed how pale and drawn were her features as he referred to certain ugly truths that might leak out.

'Yes,' she gasped, 'I know, James. We'd both find ourselves under arrest. Such a *contretemps* is really too terrible to think of.'

'But, my dear girl, it must be faced,' he said, 'if we don't get the money. Can't you work Sir Henry for a bit more, say another thousand? Make an excuse that you have bills to pay in London—dressmakers, jewellers, milliners—any good story will surely do. He gives you anything you ask for.'

She shook her head and sighed. 'I fear I've imposed upon his good-nature far too much already,' she answered. 'I know I'm extravagant; I'm sorry, but can't help it. Born in me, I suppose. A few months ago he found out that I'd been paying Mellish a hundred pounds each time to decorate Park Street with flowers for my Wednesday evenings, and he created an awful scene. He's getting horribly stingy of late.'

'Yes; but the flowers were a bit expensive, weren't they?' he remarked.

'Not at all. Lady Fortrose, the wife of the soap-man, pays two hundred and fifty pounds for flowers for her house every Thursday in the season; and mine looked quite as good as hers. I think Mellish is much cheaper than anybody else. And, just because I went to a cheap man, Henry was horrible. He said all sorts of weird things about my reckless extravagance and the suffering poor—as though I had anything to do with them. The genuine poor are really people like you and me.'

'I know,' he said philosophically, lighting another cigarette. 'But all this is beside the point. We want money, and money we must have in order to avoid exposure. You'——

'I was a fool to have had anything to do with that other little affair,' she interrupted.

'It was not only myself who arranged it. Remember, it was you who suggested it, because it seemed so easy, and because you had an old score to pay off.'

'The woman was sacrificed, and at the same time an enemy learnt our secret.'

'I couldn't help it,' he protested. 'You let your woman's vindictiveness overstep your natural caution, my dear girl. If you'd taken my advice there would have been no suspicion.'

Lady Heyburn was silent. She sat regarding the toe of her patent-leather shoe fixedly, in deep reflection. She was powerless to protest, she was so entirely in this man's hands. 'Well,' she asked at last, stirring uneasily in her chair, 'and suppose we are not able to raise the money, what do you anticipate will be the result?'

'A rapid reprisal,' was his answer. 'People like them don't hesitate—they act.'

'Yes, I see,' she remarked in a blank voice. 'They have nothing to lose, so they will bring pressure upon us.'

'Just as we once tried to bring pressure upon them. It's all a matter of money. We pay the price arranged—a mere matter of business.'

'But how are we to get money?'

'By getting a glance at what's in that safe,' he replied. 'Once we get to know this mysterious secret of Sir Henry's, I and my friends can get money easily enough. Leave it all to me.'

'But how'——

'This matter you will please leave entirely to me, Winnie,' he repeated with determination. 'We are both in danger—great danger; and that being so, it is incumbent upon me to act boldly and fearlessly. I mean to get the key, and see what is within that safe.'

'But the girl?' asked her ladyship.

'Within one week from to-day the girl will no longer trouble us,' he said with an evil glance. 'I do not intend that she shall remain a barrier against our good fortune any longer. Understand that, and remain perfectly calm, whatever may happen.'

'But you surely don't intend—you surely will not'——

'I shall act as I think proper, and without any sentimental advice from you,' he declared with a mock bow, but straightening himself instantly when at the door was heard a fumbling, and the gray-bearded man in blue spectacles, his thin white hand groping before him, slowly entered the room.

(To be continued.)

SOMETHING ABOUT SICILY.

By GEORGE PIGNATORRE, late British Vice-Consul at Messina.

SICILY, like Rome, has become nowadays one of the favourite winter-resorts of the clouds of tourists which swarm southward year by year in ever-increasing numbers from our own befogged and chilly island. But it has only become so of late, owing to the agencies which are at work in so many up to now little-known regions, and which are throwing open even the interior of the 'Dark Continent,' and already the Soudan is accessible to holders of circular tickets.

Severed as Sicily was once by distance, and by the real and fancied perils of the road, from Great Britain and Germany, not to speak of the United States, it is not surprising that the island should have remained comparatively speaking a *terra incognita* to all but those very few hardy and enterprising travellers who were not daunted by the uncertain dangers or deterred by the very certain discomforts of a journey thither. Without going too far back, we learn from Brydone (1770) that when he and his friends had decided on sailing for Messina from Naples on the *Charming Molly*, they were regarded with 'admiration and awe' by the Neapolitans, who tried in vain to dissuade them by giving them alarming accounts of the state of the island; but Brydone and his companions held firm to their purpose, and he has left us a record of their venturesome tour through Sicily and Malta in one of the most fascinating narratives of travel ever written.

The advent of the Italian Government heralded a fresh era. Within the last thirty-five years systematic brigandage has been suppressed; railways have been laid down connecting all the cities of the coast, girdling Mount Etna, and uniting some of the towns of the interior to the seaboard; commerce and industry have expanded; and the ancient granary of Rome is no longer closed to the general public.

This being the case, a few particulars from an old resident on the altered conditions of the island, embodying a few hints for those who have *not* unlimited leisure or means, may not come amiss. As to the most pleasurable season for visiting Sicily, I may be allowed to give a few words of advice suggested by my own personal experience.

The most suitable period of the year for taking a trip to Sicily is, as I have mentioned in my article on 'Rome of To-day' (*Chambers's Journal*, 1904), the spring, which out there corresponds with the calendar; for, though March is perfect when fine, the weather is rather undependable at the beginning of the month, but usually settles towards the middle. Leafy June, on the other hand, is always refreshed up to nearly the very end by the cool north-west breezes blowing over the Mediterranean and over the still snowy peaks of the loftier mountains. The herbage and the wild flowers, which are burnt up later on under the fiery rays of the scorching sun of July and August, carpet all the hillsides and fringe the torrent-beds, rendering the absence of trees less perceptible or more endurable to the eye. The tender green of the almond and acacia trees (the last with its feathery leaves and fragrant white blossom), the darker hue of the manna-bearing ash, are at their best and freshest, though they are scarcer in number than they might well be. Sky and sea vie in blueness and clearness; Japanese medlars, cherries, and strawberries are plentiful. Lastly, the bright, long days practically give the visitor at least four hours more of light to enjoy the sights and scenery he has come from so far to view. The winter is, of course, infinitely brighter and warmer than ours—*cela va sans dire*. Even if you come in dark December, there will be a greater percentage of sunny days than at home. Autumn, again, though calm and sunny, is often hot unto sultriness, the erstwhile smiling, verdant plains are yellow and burnt, and the waning days give you so little time that even if you can brave the heat you will hardly be able to do justice to the country; if you cannot, you will lose still more—you may lose half your holiday within a *pension* or an hotel.

The chief charm of the Sicilian landscape lies in the ever-changing mountain scenery which unrolls before your eyes as you speed along the Messina-Palermo or the Messina-Catania line—hills and vales, deep gorges, steep cliffs backed by the lofty Nebrodes chain and other sierras; while at intervals, overtopping them all, the giant cone of Etna shoots skywards, the lord-paramount of Sicilian mountains. Such are the distinctive traits which predominate. Nor is this rugged grandeur unrelieved by spots of softer beauty: fragrant orange and lemon groves, whose dark-green leaves, sweet white blossoms, and golden-yellow fruit stretch along the southern coast for miles and miles, presenting a pleasing contrast to the beetling rocks and boulder-strewn passes. The presence of flowers and fruit at the same time on the same tree is not uncommon here, and is due to the successive abnormal crops of many lemon-trees, which ripen in March and May, and on some plants indifferently between April and November. There is only one blemish on the fair aspect of nature, but it is a serious one. It is the dearth of trees. In the eighteenth century this woeful destruction had seemingly hardly commenced, for Brydone, speaking in 1770 of the impressive view he had beheld from the Cappucini Hill, overlooking the city of Messina and the broad straits beyond, expresses himself in these words:

'The prospect [of the straits] was terminated on either side by the tops of high mountains *covered with woods*.' Farther on he mentions 'fine shady walks on all sides of Messina.' The country has greatly changed since then. The Calabrian mountains and the Sicilian hills are bare and treeless save for some pinasters and ash-trees, which are few and far between. The shady walks have likewise disappeared. The Government has made some efforts to check disafforesting and to re-enforest some tracts in central Italy, and a Commission of Forests has been constituted; but these efforts have so far been too feeble and too ill-directed to produce the desired results.

Robbed as fair Sicily has been of her luxuriant tresses, she has preserved unimpaired through the ages her beauteous features, which it is beyond the power of man to deface. Moreover, she still contains those wondrous remains and relics of her past chequered history, which are nowhere so numerous as in Sicily. She can still show with pride her gigantic Grecian temples of Girgenti, of Selinante, and Syracuse, her Saracen mosque at Palermo, her noble Norman cathedrals of Monreale and Cefalù, one and all symbolising stirring periods in her annals, when Syracuse under Gelon and Dionysius ruled the western waves, or when the Arab emirs were nigh founding a second kingdom of Granada, or when, finally, a Norman dynasty contemporary with our own *did* found one of the most flourishing kingdoms of medieval Europe. As the successive geological strata bear witness to the succeeding changes of the earth's surface, so do Sicilian monuments recall in their style the different historical vicissitudes of the island as surely as does the old red sandstone its period.

The proper season having been selected and the route mentally chalked out, the traveller ought to know something of the people he is going to visit; and the Sicilians deserve some particular notice, from the many peculiar traits they present.

All those nations which have made Sicily their battle-ground, and which have contended for supremacy, or which have conquered Sicily in turn, have left their deep impress on the original Sikels and perhaps Sicanians with whom they have mingled their blood, and with whom they have fused themselves into one compact but compound mass. They have left vestiges of their presence in the language, habits, and character of the modern islanders. Thus their ancient dialect retains still some antique Latin forms long obsolete in central and northern Italy, whilst the blending of some of the national characteristics of many races is more singular still. They have inherited some of the quick wit of the French and some of the ceremonious manners of the Spaniards, from whom they have acquired other less desirable qualities; but, like the inhabitants of many other parts of Italy, they have never had fair-play, and their character has been warped by foreign tyranny and misrule. It is to their credit that these evil influences have not utterly crushed their spirit and hardened their hearts; that they have left them their hospitality, good-nature, and courtesy; and that in these respects they are far superior not only to the uncouth, brutal Roman, but to the Neapolitan and Genoese. Indeed, on this point, as on many others, Brydone's account of the people high and low was true to nature and holds good to this day. The description he gives us of the religious fêtes, of the superstitious reverence of the inhabitants for their local saints, might have been written yesterday. The worship of the Messinese for 'Our Lady of the Letter' (so called from an epistle written by her to her dear and beloved people of Messina) continues as fervid as ever; the devotion of the Catanese for their Saint Agatha—whose veil is the palladium of the town, though it has sometimes failed against earthquakes—is undiminished; the pride of the Palermitans in their Saint Rosalia, in whose honour they burn great quantities of gunpowder every year during her fête, is the same.

The dislike of the Sicilians for their neighbours on the mainland is quite as great. Their mode of ridding themselves by assassination of their foes is not extinct; as the over-zealous Jesuit was sometimes removed to a higher sphere in 1770, so are now more humble individuals, who are sometimes put out of the way if they incur the enmity of some influential *maffioso*. Now and then the *mafia* fly at higher game. The celebrated case of K. C. Notarbartolo, the manager of the bank at Palermo, who was murdered in a railway carriage in the autumn of 1894, is an instance in point. This gentleman was noted for his uprightness and unfaltering courage, which led him to defy the *mafia*, perhaps unwisely—anyhow with fatal consequences to himself. No serious steps were taken to track the murderers until 1900, and that an attempt was made at all is due to the fact of the return to Italy of a son of the murdered man able and willing to undertake the difficult and hazardous task of bringing the assassins to justice. Circumstantial evidence had not been wanting from the very first, but had been neglected; some witnesses now came forward and gave their evidence before the *Juge d'Instruction*, and sufficient *primâ facie* proofs were collected to justify the arrest of several prominent persons inculpated as principals or accessories before the fact. They were indicted; but the venue of the court had to be changed from Palermo to a city of northern Italy, where, after a long, almost interminable, trial in accordance with the invariable practice of Italian courts of law, a verdict of guilty was at last obtained on some of the counts of the indictment, but clogged with so many extenuating circumstances that the accused were let off with relatively light penalties, being condemned to various terms of imprisonment instead of penal servitude. Still, some satisfaction had been given to the claims of justice; and, in view of the rank and personal influence of some of the

accused, the penalty awarded was heavier than had been expected. Many had anticipated an acquittal; the sequel proved that these last were right in their anticipations. The prisoners applied to the Court of Cassation for a new trial on the ground of some informality in the proceedings; and, their application being granted, the Court of Cassation annulled the sentence and ordered the case to be tried anew, with the result that the empanelled twelve good men and true returned a verdict of not guilty, and the released prisoners were welcomed in Sicily like deliverers or public benefactors, and the dark mystery remains as impenetrable as ever.

One might be led to suppose, and with some reason, that this impunity and frequency of crime must render Sicily unsafe for travellers and foreign residents; but this is by no means the case. Such a supposition would be widely at variance with facts, for while the vast majority of the daily murderous assaults and assassinations—though they yield the palm in number to those committed in Rome, which has a proud pre-eminence in that respect—are of sufficiently appalling frequency, they are the outcome of blood-feuds or of sudden brawls, but are rarely of a wanton character, and do not affect the safety of strangers. On the other hand, organised brigandage, which was a standing danger to all, has been completely suppressed under the national Government; so that the tourist no longer requires to be protected against the blunderbusses (or their modern successors, the repeating rifles) of the gentlemen of the road and the bills of mine host, as he would have been in the times when escorts of noted desperados could be obtained to keep both blunderbusses and bills at bay. The Fra Diavolos have vanished off the scene as completely as they have from Hounslow Heath or the moors of Cumberland, though their ghosts haunt the imagination of romantic young ladies, who will not be convinced that some may not have been preserved in the woods of the interior like the aurochs in Lithuania. A gentleman, while taking out a shooting license, wished to know whether it extended to brigands as well as quails—meaning that he would be justified, he trusted, in firing on any person who accosted him suspiciously; for, as he pertinently observed, he would hardly have the time to inquire closely, and preferred shooting his man and inquiring after. All these facts fully bear out the moral that if you give a dog a bad name you may hang him off-hand, however little the dog may have deserved his fate. There is a story told by Brydone which is so illustrative of the savagery and rude ideas of honour which existed among the outlaws of old that it should not be passed over.

A brother of one of these brigands, being in want of money, and at a loss how to procure it, resolved to turn to account the terror his bandit-brother inspired, and applied to the village curate for a loan of twenty ducats. The curate asked for a brief delay to enable him to collect the sum. The other refused, and even warned the poor curate to keep out of his brother's way until he had found the money. Unfortunately, as it turned out for the brother of the bandit, curate and robber met the very next day in a narrow mountain-path. The first fell on his knees in sheer terror, begging for mercy. The robber was as astonished as the priest was terror-stricken. He faltered out the words, '*Il denaro! il denaro!* [The money! the money!] Send your brother to-morrow, and you shall have it.' The robber stopped his entreaties for mercy, telling him that he would scorn to take money from a poor priest, and that if any of his brothers had been mean enough to borrow, he would advance the sum himself. The curate then told the whole story: how the brother of the bandit had demanded twenty ducats from him for the robber. 'Well,' said the robber, 'I will convince you now whether my brother or I am most to be believed. You shall come with me to his house.' On their arrival before the door, the robber called on his brother, who, suspecting nothing, came forth. On seeing the priest, however, he began to excuse himself. The robber told him curtly that there was no possible excuse for his conduct, and that he only wanted to know the facts, whether the other had tried to borrow money of the priest in his (the speaker's) name or not. On his replying in the affirmative, the robber deliberately raised his blunderbuss to his shoulder and shot his brother dead. He then turned to the horror-stricken priest, saying, 'You will now believe that I had no intention of robbing you.' But, as I have said, brigands, like monks, have had their day; and as the former were occasionally needed as the only trustworthy escort a traveller could engage, so were the latter of much public utility as forming the only class who would give shelter and food to the wayfarer in a wild country. Carbineers have now superseded bandit escorts, and comfortable hotels the monasteries of old.

Mr Rose's capture in the later seventies of last century was, I believe, one of the last exploits of systematic brigandage on the old professional lines. According to Mr Rose's own account, he was treated very well by his captors, and parted from them on terms of mutual esteem. The chief of the band felt himself so beholden to Mr Rose for the benefit he had derived from that gentleman's detention that he was wont to send to him from time to time presents of game as a token of regard. There are still, and there will be for a long while, men who have taken to the bush—convicts or assassins fleeing from justice—who will often defy all attempts to capture them. Thanks to the half-hearted action of the local authorities and to the sympathies of the people, they have been known, like the late famous Musolino, to baffle whole battalions of soldiers and carbineers. But they are never to be met with on the beaten track, and if they were they would not meddle with

you unless you meddled with them. Of course, occasional tramps must be guarded against, but so they must be everywhere; and some parts are free even of these. The whole province of Messina, which includes Taormina within its boundaries, is, for instance, so exceptionally orderly that it will compare favourably with the quietest districts in England. The inhabitants in and around Messina are remarkably peaceable and polite. During my long residence among them I never met with anything but civility from high and low, and many a time I have experienced the simple courtesy of the peasantry when rambling over their hilly country, which is so inviting to a pedestrian.

With the establishment of the national Government—an enlightened one in comparison with the despotic and retrograde Bourbon régime—a new era of religious toleration, of civil and political liberty, has opened, and is already bearing fruit, though the crop is scanty as yet. It could hardly be otherwise. No rule, however beneficent, can reform in one generation a people debased by centuries of misgovernment and grinding oppression; and the present Government has many shortcomings; but still some progress has been achieved within the last forty years. The percentage of the illiterate, though continuing to be terribly high (70 per cent.), is declining; some years ago it was over 80 per cent. That it has not decreased more rapidly is due to the inertness of the population, and the supineness of the local authorities in not enforcing the law of compulsory education.

Materially the progress attained is far more marked. The population has risen since Brydone's time from one million five hundred thousand to three million five hundred and twenty-nine thousand two hundred and sixty-six at the last census in 1901, and it is steadily increasing. Of the three chief cities of Sicily, Palermo is one of the most splendid, Catania one of the best built, and Messina one of the most beautifully situated not only of Italy but of Europe.

Commerce, too, is flourishing. The chief articles of export, those essentially Sicilian, are fruit of the citrus group (oranges, lemons, and their various products, citrate of lime, &c.) and sulphur. It has been calculated that Sicily produces more than two-thirds of the oranges and lemons grown in all Italy; and the output of sulphur, according to official reports, averages three hundred and sixty-five thousand tons per annum. Railways now connect all the principal centres of the island, running along the northern and southern coasts, cutting across from Catania to Palermo, and even girdling, as I have said, Mount Etna. This last railway was constructed under the auspices of an Englishman, Mr Thrupp, and the time required to obtain the concession of the line was more than that required for its construction. The line traverses many famous ancient and medieval cities, and goes through a most beautiful and picturesque district, culminating near Bronté (Lord Bridport's seat) at three thousand feet.

[Since Mr Pignatorre wrote this article in Rome, the earthquake disaster of Monday morning, 28th December 1908, has left Messina in Sicily, and Reggio and many towns and villages on the opposite coast of Calabria, a mass of ruins. Messina that was has disappeared. The loss of life and property was enormous, and the catastrophe evoked world-wide sympathy and much practical assistance. Mr Pignatorre frequently mentions Brydone. This is Patrick Brydone (1741–1818), a native of Berwickshire, who acted as travelling preceptor to William Beckford and two others on the Continent, and was afterwards Comptroller of the Stamp-Office. His book, which went through seven or eight editions in his lifetime, is entitled *A Tour through Sicily and Malta, in a Series of Letters to William Beckford, Esq.* (*1773*). Mr Pignatorre (who, as will be seen, entertains a very high opinion of the book), while British Vice-Consul at Messina, rendered the work into Italian, and it was published at 120 Corso Cavour, Messina. Brydone has some ingenious speculations, even at that early date, regarding electricity generated by the waves in the Straits of Messina and elsewhere. Mr Pignatorre gives some taste of the quality of his stories.]

ANTOINE MARCOURT & COMPANY.

CHAPTER III.

HILE the conversation was going on, the medicine-major, taking advantage of the halt, with a great deal of parade had begun to dress the wounds of some of the wounded. Basins were placed in the carts, sponges and bandages, &c., produced; everything, in fact, was done to put the guard off the scent of examining the wagons. Of course we, both officers and men, were on tenterhooks all the time. Poor Lavigny's terribly hard luck had taken all the nerve out of us. His fate might still be ours. We did not know what the General knew, or what he did not know, but luckily our ruse succeeded.

'Have you finished, Lebrune?' asked the colonel sharply.

'Yes, *mon colonel*,' replied the surgeon.

'*Bon. Allons!*'

With very sober faces, as though we had all been deeply wronged, we marched slowly away, till we were well out of sight, and then we gave way to our unbridled delight, congratulating each other on

our luck. Even Lavigny's misfortune, such is human nature, brought home to us the truth of La Rochefoucauld's saying, '*Dans l'adversité de nos meilleurs amis, nous trouvons quelquechose qui ne nous deplait pas;*' and we laughed for many a day, being safe ourselves, at the fate of our jovial little friend.

Travelling as fast as we well could, we arrived at Lyons without mishap. There was, of course, a good deal to do when we got there; but my chief had promised me a short leave to see my father, as I was consumed with anxiety as to his affairs. Dangani, who, now that he had got about six thousand francs, considered himself quite a rich man, was determined to go to England, where he thought he could make money; but he was deeply grateful for all that we had done for him, and before he started he cleaned and renovated and varnished all our pictures for us, so that for some time he was very busily occupied. As for my five masterpieces, they now looked perfect gems, and I reckoned, even though the amount they would fetch might only be a drop in the ocean, that they would materially help my father, unless I found, alas! as I dreaded, that he had already become a bankrupt.

As fast as the post-boys could take me, I travelled day and night, wrought by conflicting emotions. One moment, with all a lover's longings, I looked forward to seeing my beloved Adèle, while the next I thought of my father and his troubles. The lovely scenery of the mighty Rhone had no charms for me then. I only wanted to get to my journey's end.

I arrived about ten in the morning. I actually passed the house of my fiancée. I had a hard struggle with myself not to tell the post-boy to pull up; but duty conquered for once over love, and we tore on. Through the famous Cannebière we dashed down to the Quai, where my father's office was situated. I feared almost to look up, dreading to find it closed; but no, all seemed as usual. Trembling with anxiety, I hurried through the office. For one moment I looked through a small window of the door of my father's private room ere I entered, and a terrible shock I received, so aged and careworn did my parent look.

'Father, father!' I cried, throwing my arms round him. 'I am home at last, and I hope that all is well.'

'My dear boy,' he answered, 'I almost wish you had not come. Marcourt & Company, alas! I fear, is finished. Your brother is out trying to see if he can stay the crash, but I am afraid that to-morrow the shutters will be up. If I could only get fifty thousand francs by to-morrow — fancy such a bagatelle making any difference to us!—I might stave off my misfortune for a time; but I fear the English have captured *L'Hirondelle* and *Le Lièvre*. If they had only arrived, as they should have done three days ago, I could look all the world in the face. That villain Calières has a bill due to-morrow, and I cannot meet it.'

'Look at these pictures,' I cried. 'Surely they must be worth fifty thousand francs.'

'Buying and selling, my son, are very different things,' he answered despondently.

My brother, with a downcast face, at this moment entered the room, and after our first greeting was over he told us that he had been able to do nothing. Men whose fortunes my father had made now stood aloof. But he got some of my enthusiasm as I pointed to the pictures.

'Try old Dumont the dealer,' he said. 'His real name is Moses. He knows a fine picture when he sees it. I won't come with you. If I did he would —for he knows that we are *au pied du mur*—offer little or nothing. Don't give your name. Say an officer from Spain has some pictures to sell. Take high ground, and say it is immaterial whether he buys them or not. If he will not give fifty thousand francs come away.'

Feeling anything but confident as to the success of my mission, I set off.

The suave old Jew received me with the greatest politeness. 'And what price, captain,' he said gently, 'do you want for them?'

'I am not quite such a fool, my good sir,' I replied, 'as to tell you that; it is for you to say what you will give. I have only just arrived; and if you don't care to buy them—if you think you can buy a Bellini and Botticelli every day of the week, you can. It does not matter to me.'

He took the pictures to the light and examined them closely in every way, and then looked up at me. Of course I had not the slightest idea of their value, but he could tell nothing by my countenance.

'I will give ten thousand francs for them.'

I told him he would ask twenty thousand for the Bellini. This was rather a good shot, as I had not the faintest opinion of its worth, or any knowledge of pictures at all. Then he offered twenty thousand for the lot, then thirty thousand, and finally thirty-five thousand.

Without appearing to mind in the least, but with a very heavy heart, I returned to my father.

'You have not sold them?' said my brother. 'So much the better, because I have just thought of M. Belmondière.'

This Belmondière was one of the greatest flour-merchants in Marseilles. He was enormously rich, and gave great prices for works of art. He was not really much of a judge, but he thought he was. It is those who fancy themselves judges who fall easiest victims to the dealers, who do not hesitate to flatter and fleece them.

Once more I set off, and this time my efforts were successful.

'Dumont says he will give thirty-five thousand francs, does he? Well, I never knew a dealer yet who, unless for an object, was content with 200 per cent. profit; so, if you like to take seventy thousand francs, you can have it now.'

I thanked him, and waited till he returned from

the bank. Though I knew that this amount would only for a time keep off my father's creditors, still, with a comparatively light heart, I hurried back to the office.

'Saved, saved, at any rate for a time!' I cried, as I placed the notes in my father's hands.

'My dear lad,' he answered with a trembling voice, 'if ever I get rich again you shall indeed have this amount back with interest. Now go and tell your mother.' (My mother was a Huguenot, and very serious and religious.) 'She has been praying all the week for the return of *L'Hirondelle* and *Le Lièvre*, but she little thought that you, so wild and such a scapegrace, would save us. Then go and see your dear Adèle, and tell her to come to dinner to-night.'

I did as he directed me, and then hurried off on the wings of love to find my adored Adèle.

Ah, what a meeting that was, and what a lot we had to tell each other! And in the evening, too, what a merry party we were! It was like old times, my brother and sisters said, to see my father laughing and joking again.

'Now,' said my father to my brother Charles when Adèle and her mother had left, and my mother and sisters had gone to bed, 'I do not mean to see that rogue to-morrow. I should lose my temper'—and, to tell the truth, he was rather hasty—'I should say something I should be sorry for afterwards; so I will leave it to you to pay him when he comes to receive the money to-morrow.'

'You must know, François,' said my brother when we were alone, 'that this fellow Calières some time back had a shady scheme for getting a great Government contract by which he would have made thousands, and of course we should also, for he wanted us to join him. It was a case of wholesale bribery of officials. When he knew the particulars, father would, of course, have nothing to do with it. Calières by various tricky methods has become a rich man since then, but he has never forgiven us for that affair. It has rankled in his breast ever since, and when those ships were captured the vindictive rogue, though it was no affair of his, actually took over some bills of ours from a man who was naturally only too glad to part with them, on purpose that he might be the direct means of ruining us. However, thanks to you, Calières will find he has made a mistake; but I fear nothing can save us for long if those two ships don't come in. They are laden chiefly with hides and sulphur, which have both gone up immensely since the campaign in Russia commenced. These two ships are worth half a million francs. They are overdue, but I have not given up all hope. They are commanded by two Dutchmen, brothers, Gustav and Jan Heldricks. They know their business. As bad luck would have it, the moon has been at its full up to yesterday; but it will be as dark as pitch to-night, so now they may be able to evade the English cruisers that hover near the port. The Heldricks would do their best in any case; but if they get through there will be twenty thousand francs for the captains and the crews.'

As the clock struck eleven the following morning, Calières, with a peculiar spiteful smile on his face, accompanied by his lawyer, was ushered into the private room, where my brother had asked me to stay that I might enjoy his visitor's coming discomfiture, which my timely arrival had brought about.

'I fear, M. Calières,' said Charles after greeting them with great politeness, 'that you will be disappointed.'

'Ah, you can't pay!' exclaimed Calières, springing up, his eyes flashing with vindictive pleasure. 'I have got you at last! All over Marseilles it shall be known to-day that the great firm of Antoine Marcourt & Company cannot pay their creditors.'

My brother had purposely let him run on. 'Calm yourself, my dear sir,' he continued slowly, with a touch of irony in his voice that brought an uneasy look into his visitor's eyes. 'I said that you would be disappointed because'—and here he paused—'it is a very easy matter to pay the trifling amount that is due to you.'

Calières stood dumfounded, speechless with rage, at seeing his chance of revenge fading away, as Charles quietly rose to go to the safe and take out a whole bundle of notes. 'These, I think, are for you,' he said, placing five packets of ten thousand francs on the table. 'Please check and count them, for if they are not correct we can easily make it up;' and he casually showed a large bundle of notes of one thousand francs ere he locked them up in the safe again.

With a baffled scowl on his face, Calières sat down and carefully examined and checked the packets. Save for the rustle of the notes and the ticking of the clock, all was still.

'Is it all right?' at last demanded my brother.

'Yes,' replied Calières, and forthwith signed a receipt. My brother had put this in his pocket, and Calières had taken up his hat to go, when suddenly there was a joyous cry from the old bookkeeper and a regular hubbub in the adjoining office.

'Ah, my friends, here I am, you see, safe and sound,' cried a deep, cheery foreign voice. 'I 've always told you that the ship was not built that could catch *Le Lièvre*'——

'And *L'Hirondelle?*'

'She 's all right. Jan will be here in a minute; he is clearing his papers. But where 's the patron—where 's the patron?'

'*Sacré bleu*,' exclaimed Charles, jumping up, 'that 's Gustav Heldrick! The ships are in—the ships are in! *Grace à Dieu*, we are'——

I had heard enough. I stayed to hear no more, but tore upstairs to tell my father, for I knew that his troubles were over, that he could look all the world in the face again. My mother's prayers were answered, and the great house of Antoine Marcourt and Company was saved.

THE END.

A REMINISCENCE OF R. L. S.

By A Lantern-Bearer.

R. L. S., in those early days the writer recalls, projected no shadow of his future greatness. A slender, long-legged boy in pepper-and-salt tweeds, with hair longer than other lads—who did not then sport the trim, close-cropped head so usual to-day—unwilling, because unable, to join in the rougher games that develop sturdy lads, we regarded him as an uncanny departure from all our preconceived ideas of boyhood, but gave him a ready hearing when he told us a tale of derring-do or marvellous adventure. He had about him some indescribable influence that forced us to include him in our childish ploys as looker-on, critic, and slave-driver.

One incident stands out with great clearness: the digging of a pit. In the yellow sands of the West Bay at North Berwick one may delve to great depth without striking stones or rocks; and the children who played there in that long-past August loved to dig a deep pit at the very edge of the links, with the sand thrown out to build up walls round the hole. This added to the depth, and the pit sometimes became a difficult hazard for the unlucky golfer whose ball ran off the green turf.

R. L. S., one fine morning, decided that we should have a deeper and better pit than any one else, and collected by his faithful promise of fame a number of willing workers. He had even then the compelling influence of magnetic personality that could yoke in willing obedience that most difficult team, a band of high-spirited and imaginative children. From the vantage-ground of the overhanging turf he applauded and encouraged our efforts. Sometimes he was upbraided for 'only looking on and talking.' Then he soothed our ruffled tempers with honeyed words, glowing pictures of the glory of the pit when finished, the fire that would be made of driftwood and dry seaweed, the apples we were to eat, and the stories 'we' would tell beside the fire. No one had the remotest intention of competing with R. L. S. in story-making. He was our acknowledged chief in this respect, and his tales, had we known it, were such as the world would listen to in silence and with wonder.

The pit took nearly two days to dig. As it got deeper, and the sand very difficult to throw out, R. L. S. kindly helped by lowering a bucket and hauling it up full of sand, which he added to the banks hard-beaten with our spades. And ginger-beer—rare and costly beverage—was doled out, through the bottle, to the hot party of diggers. R. L. S. had money for this, and was in consequence regarded as a millionaire.

It was a fine pit! Six feet deep and four in diameter, to us it seemed an abyss. And we never thought of the danger it presented to any one walking confidently on the turf above us. In those happy days no guardian of the peace, or at least of the public safety, interfered with the 'wheen wild laddies' of the West Bay, for the fathers of these same laddies golfed the day long over the green plains, and kept a paternal and not always friendly eye on the doings of their boys. Our pit was well out of sight, a little behind the first tee, and had so far escaped notice. Our natural enemies, the caddies, had, luckily for our plan, a very wholesome fear of one commanding spirit among the fathers. One day a malicious caddie descended like a wolf on the fold, defied nurse and the screams of the small boy who had built a sand-castle tastefully trimmed with seaweed and shells, and trampled flat as a flounder the airy fabric. The caddie had not calculated that the first round was nearly over, and that from Point Garry (commonly called 'Pingarry'), the last hole but one, his wicked raid had been noticed by the little victim's father. Six feet three in height, and full of wrath, he ran down the slope, and the caddie fled at full gallop; but his powers were feeble beside those of the magnificent Scot who pursued with his best leg foremost. The caddie gave himself up for lost, fell on his knees, and shrieked for mercy, which he did not get, but instead a sound drubbing before the small crowd that had gathered for enjoyment of the scene. The caddie's father, a burly fisherman, far from resenting his son's chastisement, next day thanked the big Scot for 'pitten some sense intil him.' Since that episode, with all the fathers against them, the caddies had not dared to interfere with those children that were in any way related to or acquainted with the Avenger. And as he happened to be the writer's father, the pit did not need any guardian.

On the afternoon of the second day our ardour faded and our backs were very stiff. The prudent R. L. S. decided that the pit was deep enough, and we descended with a small bundle of driftwood and very dry seaweed, left months ago high on the beach by the spring-tides. With sun and wind it was brittle and easy to kindle, and made only a modicum of smoke, but enough to make our pit a very Tophet. What did that matter? It was fun! The apples were bought—small, sour, and green, six a penny, cheap at the price, if one considered how large a doctor's bill might result. Faint traditions of cholera and more homely colic did not deter us from eating. But R. L. S., wise in his generation, declined apples, as he could not tell stories with his mouth full. He sat in a favourite, and in that space compulsory, attitude, his knees drawn up, his arms round them, and his chin on his knees. In the very dim firelight, and the more perceptible smoke, he looked like a son of the

Witch of Endor. His great gray eyes fixed on us, yet seeing Heaven only knows what strange visions, glowed with a fire greater and more lasting, and his wonderful brain spun a fancy web. *Robinson Crusoe*, *Aladdin's Lamp*, the *Arabian Nights*, and—to one boy at least—Dante's *Inferno* seemed pallid and dull beside the living voice, the vivid words, the reality of this teller of wonderful tales. The little smoky fire, the confined space, faded away; we roamed through Eastern palaces, heard weird incantations, saw sleepless dragons, danced with the Hesperides, and ate the golden apples. Looked back on, more than forty years ago, the glamour comes again. The voice, long silent here, beats once more on the ear with its boyish, soft Scotch accent, more pronounced then than in later years; and, in the knowledge of to-day that Genius talked to us in the sand-pit, lies deep regret that of all the magic that held our hearts still, our thoughts spell-bound, nothing remains but a nebulous outline, a haze that veils glorious scenery. Sometimes, beyond the printed pages of his works, the memory recalls beautiful phrases, melodious setting of everyday words, dreams of faery, and flights of imagination that marked out as other than ourselves the strange boy that we called then Louis Stevenson.

Suddenly we came back to earth, or sand. A golf-ball fell 'plop' on a boy's shoulder. That meant some one would come to look for it. Discretion was the better part of valour; and, with a faint hope of saving the situation and the pit, one boy climbed out to take the ball to its player, against all rules of golf. Too late! A father stood on the brink. Alas for the pit, and all our dreams of ambrosial afternoons and evenings illumined by little bull's-eye lanterns! No more tales, at least in that place. The pit was doomed in a new Apocalypse, and we were ordered to fill it up. Louis, true to himself, went off to find 'another place to talk in.'

Memory recalls the wanderings of the lantern-bearers, and economy of Saturday pennies to purchase the coveted bull's-eye. Once only did the writer escape for one of those delightful adventures, for the bounds set by the father did not meet with the approval of R. L. S., who ventured to the East Bay and the harbour. But the memory of the reek of the hot tin and ill-trimmed wick remains vivid and clear, as described by R. L. S., and perhaps repetition might have dimmed or dulled the enjoyment.

Far away in Samoa, the story-maker sleeps, and his name is set high among the great. Is it far away, or nearer than we dream, that he lives again, with no shadow betwixt his soul and the Unknown? Does he recall the earth-life, its tender and gay memories, with another who was laid in the green kirkyard of North Berwick? Harbour safe and sure have they both found, and 'the wide, untrammelled spaces' of the soul.

The best that was in R. L. S. lives on. In that Hereafter Land his dreams, his hopes, his strivings, find full and satisfying fruition, and he has found an answer to the anxious question in his beautiful essay: 'Surely not all in vain.'

A YARLSIDE ROMANCE.

By THEODORA WILSON WILSON,
Author of *Bess of Hardendale*, *Ursula Raven*, Sketches in *Punch*, &c.

PART I.

EVERY one in Yarlside knew Miss Margaret. After all, she had lived there so long. As the vicarage son and heir remarked when he wandered casually into her garden to steal early snowdrops, 'Was you a welly little girl when I was a tiny baby?'

'No, Teddy; I was quite big—as big as I am now.'

He eyed her wonderingly, then tossed back his straight-cropped head, and remarked with a sigh, 'What a *welly* long time you's lasted, hasn't you?'

'Yes, Teddy, a very long time,' she had answered simply enough. She had involuntarily put up her hand to press back the curling gray which she knew glistened amongst the brown.

The child had scampered away, with Miss Margaret's spring flowers clutched in his hot hands—a present for his 'own mummy;' and she had wandered out through the back-gate, and, following a tumbling beck, had pressed upwards through the wood towards the scar-face, which reared itself so protectingly behind the cottage.

Restlessly she walked—so restlessly that she was obliged to accept the humiliation of having to stop to pant. How long ago was it that she had raced up the brow without feeling the sting at her breast?

She gained the crest at length, and all beyond her, eastwards, lay rough limestone and short herbage. The wind was blowing, and the fell-sheep were eating with their faces towards the wind, their wool pressed tightly backwards.

Margaret found shelter behind a rock, and seated herself with her face westwards.

Far in the distance the snow was streaking the Langdales, Wetherlam, Coniston Old Man, and the rest. The sky overhead hovered a deep, intense blue; but horizonwards the oyster-coloured clouds were edged with rarest gold. Below, in the woods, the naked trees were dimmed with a subtle madder bloom, beeches still clung to their last year's auburn tints, and the green-black yews hung about the scar-face in weighty patches. And deep in the bottom rested the lily tarn, blue as the sky; while the sun poured down wide floods of golden splen-

dour, which burnished the whole wintry levels. And Margaret Langton perceived each beauty of the exquisite width of glory to the uttermost; and then hated it, as she sat there tearing to fragments an innocent tussock of faded grass.

Spring! The hateful, intolerable season, breaking through the long winter with such insolent insistence! The 14th of February to-morrow! How often she and spring had held high festival together on St Valentine's Day! But now they must drift apart for evermore. To-morrow she would be forty.

Day by day this same sun had descended, mocking her with his glory; and each day he had risen again, always young and great and all-powerful, to bring the wide world to harvest. And she had risen as he had risen, only she was a mortal woman, for whom there could be no harvest. As Teddy had said, she had lasted a 'welly long time,' and lasted for what? True, the daintily furnished cottage was her own. It was Miss Margaret who led the choir, superintended the Sunday school, tyrannised over the sick for their healing, over sinners for their highest welfare. Miss Margaret was greatly beloved, and all the children smiled straight into her eyes. She was feared also, or, in the language of Yarlside, 'terr'ble respected.' What could any woman want more?

Her father had left her but a fragment of the old family fortune; but her needs had been modest, and it was not the sense of personal poverty that set those nervous fingers to work, which caused the searching eyes to gaze so drearily over the west.

'To-morrow the dream shall be over! To-morrow I intend to wake!' so she murmured. The sun touched the mountain-tops, and for a lingering moment shot forth a dazzling farewell.

There was a sound of advancing feet, and a genial voice cried, 'I've left summut, Miss Margaret, down yonder. Registered and all.'

The woman's cheek flushed, and she could not control the startled expression on her face. Margaret walked slowly down the wood, slower as the cottage appeared through the trees. Why should she hurry? So she questioned with the dogged despair that beset her soul. For twenty years now the postman had never brought her any real joy. Why should she unnerve herself at this late hour with weak, fruitless conjecture?

She passed into her garden. Her small maid was waiting in the porch, with the letter in her hand and excitement in her eye.

'Here's this, ma'am! And I had to put my name for it and all!'

'Thank you, Belle.' In one swift glance she saw that the handwriting was strange. The fever within her cooled to ice. Even at forty the heart-beats are not quite under control. She ran upstairs with an agility reminiscent of earlier days, and, entering her own room, she locked the door. Then she opened the envelope and took out a single sheet of stiff paper. It was an intimation from a lawyer in Edinburgh that a distant relative had died, leaving her heiress to a little property bringing in eight hundred a year.

She read the letter over twice. Then she tore it across violently, and, kneeling down by her narrow white bed, she broke into an awful convulsion of intolerable weeping.

. . . . . .

Mr Martin Hill, examining certain innermost contents of his pocket-book, started nervously as his clerk breathed unexpectedly at his elbow, 'Sir Thomas wishes to see you, sir.'

'Oh, thank you, Edwards.' He spoke with the politeness he invariably used to the very meanest in the establishment. Yet his brow clouded. His clerk worried him, somehow. But what was the use of being annoyed with Edwards? He had more important matters pressing upon his attention. He closed his pocket-book, and placed a few papers together on his orderly desk with a painstaking accuracy. Then he rose to obey the summons.

'I wish to goodness Sir Thomas would have the sense to clear that old fossil out of my road!' ejaculated Edwards, a young man of brilliant complexion and restless movement. 'An old stager like him asking for a rise! Better ask for one from the old prehistoric ghosts he is for ever running after!'

Martin Hill went down three flights of stairs rather than trouble the boy at the lift, passed along an endless corridor, and knocked at an important-looking door, and in another moment stood in the presence of Sir Thomas Ridgmont-Sanderson, the head of the Imperial Publishing Syndicate.

'Ah, Mr Hill! Yes, one moment. Sit down, will you?' He dropped some torn sheets into a waste-paper basket at his side, then drew forward a letter that was lying on his desk, and let his eyes run over it. He leaned back in his chair, and the sub-editor knew that his chief's mind was absolutely made up. 'As regards the suggestion in this letter, Mr Hill.' He paused and looked at his man keenly. 'You consider that a rise of salary is due to you?'

That certainly was the blunt meaning of the sub-editor's rather involved letter, and he inclined his head.

'A curious want of understanding,' commented Sir Thomas meditatively. 'Surely you have discovered by this time that the higher rates of pay can only be commanded by men who possess that particular temperament, or perhaps I might say instinct, for feeling the pulse of the Great Public, which I regret to say neither I nor my colleagues have found in yourself. Not that I have a word to say against your general work. I understand that it is altogether painstaking, and in its measure valuable.' Here the great man gave a smile which he meant to be reassuring. 'That being so, I entirely anticipate that you may still be of service to us; but

as regards any increase in salary'—— He shook his head decidedly. 'There are men below you whom I could immediately put in your place without disadvantage to the syndicate. Shall we consider this letter withdrawn?'

'I think I understand, Sir Thomas.' There was a grave dignity in the man's manner, in spite of his obvious nervousness. 'I had thought that after all these years'——

'It is, of course, the years that constitute the difficulty,' Sir Thomas interrupted quietly.

Martin Hill coloured from cheek to the high forehead, now being deserted by the once abundant hair. 'I think I understand—your position and mine, sir,' he said steadily as he rose.

Sir Thomas rose also, entirely genial, now that the business was concluded. 'Ah, well, just let me have your definite answer either way in writing this evening. And of course, if at any time you find that you can better your position, I shall be delighted, only too delighted, to assist you. Good-morning!—Ah, Edwards, before your time as usual—a pardonable fault.'

'Good-morning, Sir Thomas.' So said Martin Hill. Then he passed from the room.

(To be continued.)

MOGADOR: A POTENTIAL WINTER RESORT.

By EUSTACE REYNOLDS-BALL, F.R.G.S.

The Earth is a peacock. Morocco is the tail of it.
Moorish Proverb.

MOGADOR, on the Atlantic coast of Africa, is the most southerly outpost of winter colonisation in Morocco, and possesses many natural features, climatic and geographical, which make for a winter resort. Indeed, were not Mogador situated in this Land of Unrest, it would no doubt have rivalled Algiers or Biskra. There is a legend that its name is derived from a certain enterprising Scotsman called Macdougall, who was wrecked on this inhospitable coast some four hundred years ago, and settled on the site of what is now Mogador. He was held in such esteem by the Moors that they canonised him, and built a *kouba* (shrine) to 'Sid Mogdoul,' and named the port after their tutelary saint.

To the exigent traveller, anxious to get quite away from the well-worn round of travel and the beaten track of the globe-trotter, to whom Tangier and Tunis, and even Damascus or Jerusalem, are familiar and commonplace, who wants to realise what the real unvarnished Orient is, we would say let him go to Mogador. Here there is not the faintest trace of Europe, which might, indeed, be at the Antipodes instead of being within a few days' sail of London. The first view of the white-walled city set in its landlocked harbour, with the dim and visionary hills in the far distance, is singularly striking and impressive.

Passengers to Mogador must, however, be prepared to put up with the inconveniences which are so familiar an experience with travellers disembarking at Jaffa, for in bad weather no boats can land. There is a legend that when the last British Consul married, and had a lot of furniture sent out from England, the Forwood steamer was unable to land it on the outward voyage, and could not do so on her homeward voyage after her trip to the Canaries, and returned to London without touching at the White City at all!

We land at the quaint old water-port gate, above which is the Arabic inscription, 'The glorious King my Lord Mohammed ordered the building of this gate by his servant Hamed, son of Hammou, 1184.' We must not, however, suppose that the gate is as old as the date might lead one to believe, for of course 1184 refers to the Mohammedan era; in fact, the water-gate is actually no older than the eighteenth century. We are at once initiated into Oriental habits when the question comes of passing our luggage through the Customs. The official will probably be absent or engaged. After examining our credentials and passport in a dignified and impassive manner, he will probably 'pass' our baggage with a condescending wave of the hand, though probably much of the backsheesh with which we propitiate his underlings will eventually pass through his hands.

Tangier, with its electric light installation and telephones, is now almost as banal and commonplace from the artistic point of view as Algiers or Alexandria. But to Mogador, indeed, one might suitably apply the picturesque bit of word-painting in which Edmondo de Amicis describes his landing at Tangier: 'I looked, and beheld behind the boats that were coming to take off the passengers a crowd of half-naked, ragged Arabs, standing up to their hips in the water, and pointing out the ship with eager gestures, like a band of brigands rejoicing over their approaching prey. Not knowing who they were or what they wanted, I descended with an anxious mind into the boat with the other passengers. When we had come to within twenty paces of the shore, all this brick-coloured crew swarmed into our boat and laid hands upon us, vociferating in Spanish and Arabic, and making us understand that, the water being too low for us to land from the boats, we were to be transported upon their shoulders—which information dissipated our fears of robbery, and imposed in their stead the dread of vermin. The ladies were borne off in triumph upon stools, and I made my entrance into Africa upon the back of an old mulatto, with my chin resting

upon his bare skull and the tips of my toes in the water.'

There was formerly a small European hotel at Mogador, known as the Fonda Fuera, owned by an enterprising Scotswoman; but this is now closed, and visitors to Mogador will probably put up at the famous Palm-Tree House Hotel, some three or four miles beyond the walls. The hotel is evidently named on the *lucus a non lucendo* principle, as there is not a single palm-tree within sight. 'It lies in a lonely situation, with the advantage of a view and an open wild country all round. It has none of the drawbacks of the city; it is breezy, wild, and bare. The stunted bush and the sand fringe the very walls. It had the country to itself, and there was nothing *but* itself which could spoil that country. It was cool and airy, and oddly quiet. Inside, tiles and open *patios* and big panelled rooms gave all that could be desired; outside, there was an impression of simplicity and freedom.' Such is the attractive description of this remarkable hostelry given by Mrs Isabel Savory in her delightful book, *In the Tail of the Peacock*.

Of course one is prepared to find here the Oriental local colour and the *Arabian Nights* atmosphere which is a common characteristic of all Oriental bazaars, even in 'Giaour-ridden Tangier' and Gallicised Algiers. But at Mogador there is an additional picturesque and romantic element, owing to the presence of the Berbers of the wild Sus Land, a country like the danger-zone between Tetuan and Melilla, nominally subject to the Sultan, but peopled by ferocious tribesmen who acknowledge no master but the sword. A quaint legend of the origin of the Sus is to be found in the Koran. They are supposed to be descended from certain Berbers who were carried off by King David in sacks, and deported from Syria on account of their ferocious character. When the caravan had arrived somewhere near the Atlas Mountains the leader called out in the Berber tongue, 'Sus,' which means 'empty out.' So these exiles were ignominiously tumbled out of their sacks, and the region in which they settled is called Sus to this day.

Perhaps in no bazaar in North Africa accessible to foreigners can a greater variety of curious and quaint native products be obtained than at Mogador. Here we get ostrich feathers, ivories, all kinds of weapons, quaint domestic implements, curios, ornaments, pottery, &c.

In few towns in Morocco open to foreigners can better shooting and fishing be had than in the neighbourhood of Mogador; and there are no vexatious regulations as to the number of big game which may be bagged, as in the Zambesi district, for instance.

The tourist angler would find plenty of sport in the neighbourhood of Mogador. Of migratory fishes, the huge *azlimzah* (*Sciœna aquila*) and *tasargelt* (*Temnodon saltator*, identical with the American 'blue-fish') are often present in large numbers, especially in autumn; while other sporting fish are the bass and spotted bass, gray mullet, pink snapper, and red stump-nose, several varieties of sea-bream, mackerel (though not so frequently found here as farther north), garfish, scad, bonito, lichia, conger, pouting, &c.

The sea-fishing is not so good in Mogador Bay as outside Mogador Island, described by Sir Francis Drake in 1577, when he made the bay the rendezvous for his little fleet of six ships, the largest a hundred tons, the smallest twenty, with which he was preparing to scour the African coast and Spanish Main. Good fishing can be done from some of the outlying rocks of this picturesque and (in spring) flower-spangled island; but landing on it is not always allowed, as, for instance, when it is used as a *lazaretto* or quarantine station for pilgrims returning from Mecca.

The neighbouring little river Kseb, which flows into the sea near the village of Diabat, contains plenty of smallish barbel, also eels and numerous water-tortoises.

There can be no question that Mogador is an economical residence. Indeed, housekeeping is even cheaper than in Malta or Cyprus, perhaps the cheapest winter quarters in the Mediterranean. Mutton can be bought at threepence a pound, and eggs at sixpence a dozen, while vegetables and fruit are about half the prices charged at Gibraltar. A good riding-horse can be bought for five pounds or six pounds, while its keep need not cost more than one pound a month.

Game is plentiful, good bags of partridge, quail, plover, and duck being obtainable within a few miles of the walls.

As a field for a winter holiday, or even as a goal for a three weeks' holiday cruise, Mogador has much to recommend it. It can be reached comfortably and very cheaply by Messrs Forwood's steamers, a line recently acquired by the Royal Mail Steam Packet Company. This line makes a feature of the twenty-five days' circular voyages, *vid* Gibraltar and Tangier, and home by way of the Canaries and Madeira, for twenty guineas, first class.

AT SEA.

A FAREWELL.

The sea is hush'd in presence of the land,
As thou hast charm'd my spirit in the past.
White in the moonlight, as our ship glides fast,
The coral glaciers of Socotra stand.
Orion, whom, together, we last scann'd
O'er the hedge at Momoyama, shines to-night!
The stars are witness of our farthest flight,
Denying Space. Nor can I joy withstand
While Chance, that bears me from thee, caring not,
Leaves Memory and Imagination free—
The Powers to keep the Past, and give me faith
That, absent, we still share each other's lot,
And, as I roam, each scene, each joyful breath
Enriching me enriches also thee.

THE HEART OF THINGS.

By Henry Leach.

London, *Yesterday.*

IT is generally a poor thing to take pride in our own charity; but there may be a fair feeling of satisfaction at the splendid manner in which the British people responded to the appeal made by the Lord Mayor of London to come to the assistance of those poor Sicilians who have suffered so terribly by the recent earthquakes. Foreigners were impressed by the goodness of the heart of Britain when they found that more than sixty thousand pounds were subscribed to the Mansion-House Fund in the short space of six days. The record of these City funds, which of course are national and not at all local to London, is the most wonderful thing of its kind. No fewer than a hundred and sixty of them have been organised since 1872, when they were first started; and it is a curious, if sad, coincidence that the first of all was got up in aid of those who suffered by the great inundation in Italy in the year named. On that occasion the fund reached a total of over seven thousand pounds. It was a small but worthy beginning, and since then no fewer than six million pounds have been collected through this agency for the afflicted in great calamities. Three separate Indian famine funds have realised a total of nearly a million and a half; but the highest on record for a single fund was the one million one hundred and thirty-nine thousand pounds which was obtained at the time of the Transvaal war, though it should be added that in this case the lists were kept open during four mayoralties. In two separate years there have been eight different funds organised. The smallest sum ever collected by a Mansion-House Fund was seventy-one pounds, and it was for the relief of the distressed persons in the Forest of Dean in 1875. One time fifty pounds' worth of coppers was found in the box which may almost daily be seen outside the Mansion-House. The Mansion-House has sent its relief to sufferers from all kinds of disasters and to all parts of the world, without any distinction whatever; and it may well be held that it is the most universal reliever, besides having the supreme merit of being immediate.

* * *

But it is inevitable that overwhelming calamities like that in Sicily, making such a strong appeal to the sympathies of civilised people, must have a somewhat prejudicial effect upon other funds that are in constant need of assistance from the public purse; and from the point of view of the managers of these funds the earthquakes happened at the worst possible time, just when the public were about to make their annual subscriptions to the hospitals and other institutions. On the whole, the flow of public money to the London hospitals is well maintained, despite the difficulties of the times; but the usefulness of some of the smaller hospitals is occasionally hampered by shortage of funds. These hospitals are certainly one of the features of modern London that the people may be proud of, and the amount of work that they do must seem almost incredible to those who have no intimate knowledge of them. Take, for instance, the wonderful London Hospital, in the eastern part of the Metropolis. More than six million patients have been relieved through this agency since it was founded, and for the last five years the wards have contained a daily average of about eight hundred sufferers. For more than a hundred years the great receiving-hall, from which the patients admitted are sifted into the various wards, has been open day and night; and it has been estimated that on an average a serious case enters it about every three minutes, while during every twenty-four hours an average of forty-eight patients are put under anæsthetics. The number of out-patients seen daily is considerably over a thousand. Then, again, there is St Bartholomew's Hospital, which in the course of a year admits over a hundred thousand patients. We get a curious view of the enormous extent of the work

[*All Rights Reserved.*]

done by an institution of this kind in the records of its dispensary. It is nearly three hundred years since the governors of St Bartholomew's first came to a decision that they must have a dispensary of their own on the premises. Before that time the physicians and surgeons who attended had to take with them the various remedies which were needed by the patients to whom they were giving their attention. The governors' report was that: 'According to an order of the 22nd day of January last (1614), as concerning oyntments, salves, phisicke ministered to the poore of this hospital, that they, upon consyderation, had thincke it fytt and necessary for the more better curings of the poore, that all the oyntments, salves, and phisicke applied to and for the helpe and cure of the said poore be made in some convenient place within this hospital, whearby the poore may the rather and the better be provyded of these necessaries.' So Humphry Croxton was appointed the first apothecary to the hospital, and the place where he dispensed was called the 'apothecary's shop,' and the dispensary is even called the 'shop' to this day, though for long there has been no apothecary. And from this 'shop' we are told that over two and a half tons of boracic acid go forth into the wards every year to be used for surgical lotions, and particularly for the eyes, a ton of bicarbonate of soda and three hundredweight of bismuth salts (both of which are used to a large extent in digestive mixtures), and two and a half tons of Epsom salts. Think of it—two and a half tons of Epsom salts!

* * *

Sir Hubert von Herkomer did a good thing the other day when he pointed out some of the peculiar evils from which artists suffer at the present time. Never were such prices paid for pictures as now, but never have artists found the struggle for existence so severe; and it is probable that the artistic sense and taste of the people at the present time are not so fine as they have been in past generations. Here, then, we have some contradictory circumstances. The explanation is simply this: that these high prices are paid for pictures often not because the people who pay them are such excellent connoisseurs, but simply because they regard these purchases, made in the auction-rooms in competition with others like themselves, as a kind of sport. They have the joy and excitement of conflict, the tense moments of the crisis, the attention and the admiration of a crowd of people looking on, and the glory of victory and sorrow of defeat. The picture is a medium, an excuse for this contest. Sir Hubert, in referring to what he himself called 'this modern gambling in old masters,' said that it was due not to the love of art but to the pride of price, and he could not too strongly emphasise the fact that antiquarian-value was not art-value, and that nothing could be more illogical than the prices at which the works of the old masters were changing hands. He quoted the case of Millet's 'Angelus,' for which the artist was originally paid the sum of forty pounds. Then it was sold for seventy-two pounds, while at subsequent changes of owners it fetched four hundred and eighty pounds, then fifteen hundred and twenty pounds, next six thousand four hundred pounds; up it went after that with a jump to twenty-two thousand one hundred and twenty pounds, and at last an American millionaire purchased it for thirty-two thousand pounds! In making his protest Sir Hubert said that the artistic value of a picture was fixed when it left the painter's easel, and it was monstrous that art should be utilised for the speculations of the auction-room. He suggested that a percentage of these extravagant prices should go to the descendants of the artist, and that, failing such descendants, the State by law should receive such percentage, and apply it to the purchase of works by living artists. The State would have plenty of scope for selection, for lately we came by an estimate that more than a hundred thousand pictures were offered for sale at the London galleries in the course of a year. It is said that at any time from October to July there are ten thousand pictures on exhibition at these galleries, and that at least once a month—and in the case of the smaller galleries two or three times—the whole lot are cleared out to make room for a fresh supply. What becomes of all these acres of painted canvas nobody seems to know. The works of scarcely any deceased master have attracted more spirited speculation in the auction-room of late years than those of Sir Thomas Lawrence. A few years ago they were realising a steady two or three thousand guineas each; but early in 1907 there was one sold for four thousand, while in the summer of that year what was known as the Peel Lawrence—being the portrait of Julia Peel (afterwards Countess of Jersey) as a child, entitled 'Childhood's Innocence,' which was sent along by the trustees of the settled estates of Sir Robert Peel of Drayton Manor—fetched eight thousand guineas, and even at that the purchaser seemed to have a right to consider he had a bargain, since an offer of ten thousand guineas was made privately before the auction.

* * *

We believe that there is an increasing taste for really good literary work of the lighter philosophical kind, and it is a good taste; but the ideas of many of us seem to be a little disturbed when we come to make an examination of some real statistics as concerning the books that people read and that are being made for them. New books have been divided into six classes. One goes under the title of 'Fiction and Juvenile Works, &c.,' a second is 'Theology and Philosophy,' a third is 'History and Biography,' a fourth is 'Arts and Sciences,' a fifth is 'Poetry and the Drama,' and the sixth is 'Travels, &c.' Now, what order would you, reader, be inclined to suggest these books hold in the estimation of and in popularity with the general public—not

a particular class, remember, an educated and cultured and thinking class, but the entire mass of the public, including philosophers, statesmen, dukes and duchesses, office-boys and servant-girls? Interpreting your thoughts, may we not say that certainly Fiction must be first? Then, remembering the modern vogue for romantic biography and other circumstances, we would place 'History and Biography' second; but having in mind the British Empire, the vast wanderings far afield into strange lands of its sons, and the spirit of adventure which has always imbued the nation, we think that 'Travels, &c.' must be very close up—a good third. Perhaps 'Arts and Sciences' would be fourth. We would have confidence in placing 'Theology and Philosophy' fifth, and, hard as it might be to do it, we would have to dump 'Poetry and the Drama' into the sixth and last position. That is how most of us would reckon up the taste of the general reader. See, then, how it corresponds and does not correspond with the real truth, as carefully ascertained. Book publishing is naturally on the increase, though not rapidly so. In 1905 six thousand eight hundred and seventeen new books (we are not speaking of reprints) were issued; and in the three following years the numbers were six thousand nine hundred and eighty-five, seven thousand seven hundred and one, and seven thousand five hundred and twelve. In each of these four years the fiction section held a long lead; and, though it is now being threatened from a most unexpected quarter, it hardly looks like being caught up in our time. About a quarter of all new books published belong to it. Now here comes a surprise. Second to 'Fiction' in the 1905 contest among the different classes was 'Theology and Philosophy.' It was a hard struggle between the three sections that followed the leader; but 'Theology and Philosophy' came in well ahead at the finish, with 'History and Biography' third, and 'Arts and Sciences' fourth. You who have been looking for a brave show for 'Travels, &c.' inquire anxiously where they are, and if they started in the race; and, alas! we see them just coming along round the far corner, a miserable last, beaten badly even by 'Poetry and the Drama.' This is one of the surprises of the race, and the other one is the great display of 'Theology and Philosophy.' This 'form,' as sportsmen would say, is confirmed in the following year, when the same order is maintained; but 'Theology and Philosophy' show a weakening, and 'Travels' a very slight strengthening, which is much more than discounted by a fine spurt made by 'Poetry and the Drama.' But in 1907 there is a great upheaval. Except that the invincible 'Fiction' keeps in the first place, all the others have new occupants. Some will note with a certain satisfaction that 'Theology and Philosophy' get beaten for second place, but the books that do it are not what we would have expected. It is the 'Arts and Sciences' that jump into this place of honour, while 'History and Biography' drop into fourth place. 'Travels' at last does something to justify our early belief in it, and gets the better of 'Poetry and the Drama' by a single book—something of a Cadmean victory this.

* * *

Meanwhile, the issue of reprints is increasing marvellously, and is now nearly twice as numerous as it was only three years ago. It becomes evident that the new novel has a harder battle to fight in the future than it has had in recent years, and just at present readers as well as publishers are seriously complaining that the new fiction that is being supplied to them is poor stuff. A feeling which seems to be common to many writers in these days is that life is much too short to admit of the slow and studious methods of the old novelists, and they make balm for their artistic consciences by urging that the best work of a man is that which is tumbled out from his brain at white-heat. The other day we read the praises of a young novelist who had devoted only fourteen evenings to the preparation and completion of his *magnum opus!* The reputation of poor Anthony Trollope has been made to suffer because he had his clock in front of him as he worked, and made a point of grinding out so many words in the hour; but what a deliberate, painstaking craftsman was he in comparison with the modern man, who has already come by the device of speaking his works into a phonograph, from which a staff of clerks reduces them to writing! Despite the poor show made by 'History and Biography' in the battle of the books, the result of which we have recorded, there is no doubt that what we call romantic biography, the field for which is vastly rich and is only just now beginning to be explored by writers, is fast increasing in favour. Tales of the time of Napoleon are especially popular. Some time since we remarked upon the Napoleonic craze, as it may be called, which pervades the taste of the time in literary and other matters, and it continues unabated. A publisher told us the other day that there is no new book so certain of a reasonable success as a book on Napoleon, and such books are being turned out in numbers. We have lately been interested in a little one that is different from others, and most excellently interesting. It is called *Napoleon*, and is the work of Mr J. T. Herbert Baily, editor of the *Connoisseur Magazine*, from whose office it is published, and it consists of tales, and nothing but tales, mostly on the personal side and very piquant; while there are some fine portraits of Napoleon at different periods of his career. For the last hundred years we have been saying all the bad things about him that we could think of, and have tried to excuse or have passed over the miserable boorishness of Sir Hudson Lowe's custodianship of the fallen Emperor at St Helena; but now there are signs of a new feeling being abroad. Not once but several times lately have there been writings in which the most has been

made of his virtues, while his faults have been shown to be less hideous than they had been imagined. It is being delicately suggested that he was really a good sort of man who fulfilled an inevitable, and to some extent distasteful, destiny as humanely as he could, who always sought for peace and avoided war unless it were thrust upon him! These are times which are severely shaking most of our old beliefs and traditions. What shall we believe in? What shall we like and dislike? How will all our views be changed by the time our young men are gray-haired, and an aeroplane will be moored to the chimney of every workman's cottage!

THE HOUSE OF WHISPERS.

CHAPTER XIV.—CONCERNS THE CURSE OF THE CARDINAL.

GABRIELLE and Walter were seated together under one of the big oaks at the edge of the tennis-lawn at Connachan. With May Spencer and Lady Murie they had been playing; but his mother and the young girl had gone into the house for tea, leaving the lovers alone.

'What's the matter with you to-day, darling?' he had asked as soon as they were out of hearing. 'You don't seem yourself, somehow.'

She started quickly, and, pulling herself up, tried to smile, assuring him that there was really nothing amiss.

'I do wish you'd tell me what it is that's troubling you so,' he said. 'Ever since I returned from abroad you've not been yourself. It's no use denying it, you know.'

'I haven't felt well, perhaps. I think it must be the weather,' she assured him.

But he, viewing the facts in the light of what he had noticed at their almost daily clandestine meetings, knew that she was concealing something from him.

Before his departure on that journey to Japan she had always been so very frank and open. Nowadays, however, she seemed to have entirely changed. Her love for him was just the same—that he knew; it was her unusual manner, so full of fear and vague apprehension, which caused him so many hours of grave reflection.

With her woman's cleverness, she succeeded in changing the topic of conversation, and presently they rose to join his mother at the tea-table in the drawing-room.

Half-an-hour later, while they were idling in the hall together, she suddenly exclaimed, 'Walter, you're great on Scottish history, so I want some information from you. I'm studying the legends and traditions of our place, Glencardine. What do you happen to know about them?'

'Well,' he laughed, 'there are dozens of weird tales about the old castle. I remember reading quite a lot of extraordinary stories in some book or other about three years ago. I found it in the library here.'

'Oh! do tell me all about it,' she urged instantly. 'Weird legends always fascinate me. Of course I know just the outlines of its history. It's the tales told by the country-folk in which I'm so deeply interested.'

'You mean the apparition of the Lady in Green, and all that?'

'Yes; and the Whispers.'

He started quickly at her words, and asked, 'What do you know about them, dear? I hope you haven't heard them!'

She smiled, with a frantic effort at unconcern, saying, 'And what harm, pray, would they have done me, even if I had?'

'Well,' he said, 'they are only heard by those whose days are numbered; at least, so say the folk about here.'

'Of course it's only a fable,' she laughed. 'The people of the Ochils are so very superstitious.'

'I believe the fatal result of listening to those mysterious Whispers has been proved in more than one instance,' remarked the young man quite seriously. 'For myself, I do not believe in any supernatural agency. I merely tell you what the people hereabouts believe. Nobody from this neighbourhood could ever be induced to visit your ruins on a moonlit night.'

'That's just why I want to know the origin of the unexplained phenomenon.'

'How can I tell you?'

'But you know—I mean you've heard—the legend, haven't you?'

'Yes,' was his reply. 'The story of the Whispers of Glencardine is well known all through Perthshire. Hasn't your father ever told you?'

'He refuses.'

'Because, no doubt, he fears that you might perhaps take it into your head to go there one night and try to listen for them,' her lover said. 'Do not court misfortune, dearest. Take my advice, and give the place a very wide berth. There is, without a doubt, some uncanny agency there.'

The girl laughed outright. 'I do declare, Walter, that you believe in these foolish traditions,' she said.

'Well, I'm a Scot, you see, darling, and a little superstition is perhaps permissible, especially in connection with such a mystery as the strange disappearance of Cardinal Setoun.'

'Then, tell me the real story, as you know it,' she urged. 'I'm much interested. I only heard about the Whispers quite recently.'

'The historical facts, as far as I can recollect reading them in the book in question,' he said, 'are to the effect that the Most Reverend James Cardinal Setoun, Archbishop of St Andrews, Chancellor of the Kingdom, was in the middle of the sixteenth century directing all his energies towards consolidating the Romish power in Scotland, and not hesitating to resort to any crime which seemed likely to accomplish his purpose. Many were the foul assassinations and terrible tortures upon innocent persons performed at his orders. One person who fell into the hands of this infamous cleric was Margaret, the second daughter of Charles, Lord Glencardine, a beautiful girl of nineteen. Because she would not betray her lover, she was so cruelly tortured in the Cardinal's palace that she expired, after suffering fearful agony, and her body was sent back to Glencardine with an insulting message to her father, who at once swore to be avenged. The king had so far resigned the conduct of the kingdom into the hands of his Eminence that nothing save armed force could oppose him. Setoun knew that a union between Henry and James would be followed by the downfall of the papal power in Scotland, and therefore he laid a skilful plot. Whilst advising James to resist the dictation of his uncle, he privately accused those of the Scottish nobles who had joined the Reformers of meditated treason against His Majesty. This placed the king in a serious dilemma, for he could not proceed against Henry without the assistance of those very nobles accused as traitors. The wily Cardinal had hoped that James would, in self-defence, seek an alliance with France and Spain; but he was mistaken. You know, of course, how the forces of the kingdom were assembled and sent against the Duke of Norfolk. The invader was thus repelled, and the Cardinal then endeavoured to organise a new expedition under Romish leaders. This also failing, his Eminence endeavoured to dictate to the country through the Earl of Arran, the Governor of Scotland. By a clever ruse he pretended friendship with Erskine of Dun, and endeavoured to use him for his own ends. Curiously enough, over yonder'—and he pointed to a yellow parchment in a black ebony frame hanging upon the panelled wall of the hall—'over there is one of the Cardinal's letters to Erskine, which shows the infamous cleric's smooth, insinuating style when it suited his purpose. I'll go and get it for you to read.'

The young man rose, and, taking it down, brought it to her. She saw that the parchment, about eight inches long by four wide, was covered with writing in brown ink, half-faded, while attached was a formidable oval red seal which bore a coat of arms surmounting the Cardinal's hat.

With difficulty they made out this interesting letter to read as follows:

'RYCHT HONOURABLE AND TRAIST COUSING,—I commend me hartlie to you, nocht doutting bot my lord governour hes written specialye to you at this tyme to keep the diet with his lordship in Edinburgh the first day of November nixt to cum, quhilk I dout nocht bot ye will kepe, and I know perfitlie your guid will and mynd euer inclinit to serue my lord governour, and how ye are nocht onnely determinit to serue his lordship, at this tyme be yourself bot als your gret wais and solistatioun maid with mony your gret freyndis to do the samin, quhilk I assuris you sall cum bayth to your hier honour and the vele of you and your houss and freyndis, quhilk ye salbe sure I sall procure and fortyfie euir at my power, as I have shewin in mair speciale my mynd heirintil to your cousin of Brechin, Knycht: Praing your effectuously to kepe trist, and to be heir in Sanct Androwis at me this nixt Wedinsday, that we may depairt all togydder by Thurisday nixt to cum, towart my lord governour, and bring your frendis and servandis with you accordantly, and as my lord governour hais speciale confidence in you at this tyme; and be sure the plesour I can do you salbe evir reddy at my power as knawis God, quha preserve you eternall.

'At Sanct Androwis, the 25th day of October (1544). J. CARDINALL OFF SANCT ANDROWIS.

'To the rycht honourable and our rycht traist cousing the lard of Dvn.'

'Most interesting!' declared the young girl, holding the frame in her hands.

'It's doubly interesting, because it is believed that Erskine's brother Henry, finding himself befooled by the crafty Cardinal, united with Lord Glencardine to kill him and dispose of his body secretly, thus ridding Scotland of one of her worst enemies,' Walter went on. 'For the past five years stories had been continually leaking out of Setoun's inhuman cruelty, his unscrupulous, fiendish tortures inflicted upon all those who displeased him, and how certain persons who stood in his way had died mysteriously or disappeared no one knew whither. Hence it was that, at Erskine's suggestion, Wemyss of Strathblane went over to Glencardine, and with Charles, Lord Glencardine, conspired to invite the Cardinal there, on pretence of taking counsel against the Protestants, but instead to take his life. The conspirators were, it is said, joined by the Earl of Kintyre and by Mary, the sixteen-year-old daughter of Lord Charles, and sister of the poor girl so brutally done to death by his Eminence. On several successive nights the best means of getting rid of Setoun were considered and discussed, and it is declared that the Whispers now heard sometimes at Glencardine are the secret deliberations of those sworn to kill the infamous Cardinal. Mary, the daughter of the house, was allowed to decide in what manner her sister's death should be avenged, and at her suggestion it was resolved that the inhuman head of the Romish Church should before his life was taken be put to the same fiendish tortures

as those to which her sister had been subjected in his palace.'

'It is curious that after his crime the Cardinal should dare to visit Glencardine,' Gabrielle remarked.

'Not exactly. His lordship, pretending that he wished to be appointed Governor of Scotland in the place of the Earl of Arran, had purposely made his peace with Setoun, who on his part was only too anxious to again resume friendly relations with so powerful a noble. Therefore, early in May 1546, he went on a private visit, and almost unattended, to Glencardine, within the walls of which fortress he disappeared for ever. What exactly occurred will never be known. All that the Commission who subsequently sat to try the conspirators were able to discover was that the Cardinal had been taken to the dungeon beneath the north tower, and there tortured horribly for several days, and afterwards burned at the stake in the courtyard, the fire being ignited by Lord Glencardine himself, and the dead Cardinal's ashes afterwards scattered to the winds.'

'A terrible revenge!' exclaimed the girl with a shudder. 'They were veritable fiends in those days.'

'They were,' he laughed, rehanging the frame upon the wall. 'Some historians have, of course, declared that Setoun was murdered at Mains Castle, and others declare Cortachy to have been the scene of the assassination; but the truth that it occurred at Glencardine is proved by a quantity of the family papers which, when your father purchased Glencardine, came into his possession. You ought to search through them.'

'I will. I had no idea dad possessed any of the Glencardine papers,' she declared, much interested in that story of the past. 'Perhaps from them I may be able to glean something further regarding the strange Whispers of Glencardine.'

'Make whatever searches you like, dearest,' he said in all earnestness, 'but never attempt to investigate the Whispers themselves.' And as they were alone, he took her little hand in his, and looking into her face with eyes of love, pressed her to promise him never to disregard his warning.

She told him nothing of her own weird experience. He was ignorant of the fact that she had actually heard the mysterious Whispers, and that, as a consequence, a great evil already lay upon her.

(To be continued.)

THE HOLLAND HOUSE CIRCLE.

WE hear some talk in these days of a great revival of the political *salon*, particularly on the Liberal side of politics. To an extent it has already been accomplished; and, of course, the politicians of the other way of thinking have had their famous drawing-rooms for gossip-places continuously. But society in modern times is so much disintegrated from a variety of causes, and some of the finer social arts are considered as of so much less consequence than they once were, that we doubt exceedingly whether a band of the cleverest and most powerful enthusiasts could ever organise a *salon* that would be in the least degree comparable with some of the most famous of the days of our great-grandfathers. We do not now cultivate the peculiar sympathies and interests which are necessary. Now, it is just about a hundred years since there flourished at Holland House one of the most celebrated *salons* that have ever existed. Lord Holland was, of course, the Whig statesman, and his lady was one of remarkable strength of mind, intellect, and social dominance. This pair attracted to their mansion everybody who was any one at all; a considerable social world seemed to have it as its centre, and what has come to be known as the Holland House circle was one of the most wonderful aggregations of intellect. Somehow, feeling that there is a dullness about these present times, born of anxiety, overcrowding, and the premium which is put upon mere smartness and commercialism at the expense of better virtues, one always turns with pleasure to the contemplation of incidents of the social history of this dead age; and not a book of its kind has been published since last summer that is better worth reading and affords nicer enjoyment than Mr Lloyd Sanders's gossipy account of *The Holland House Circle*, published by Methuen's. We have pictures of the Hollands and of all whom they encountered, and lively anecdote in rich abundance. Lady Holland established a considerable reputation for her asperity of manner, and deserved it; but there was proper womanliness in her nature after all. Some one once asked her whether in her opinion Lady Byron loved Lord Byron, and she answered pensively, 'She must have done so; he was such a lovable person. I remember him sitting there, with that light behind him, looking so beautiful!' We have her in another mood when Guizot called on her and found her alone. He asked her if she were often in that solitary state, and she answered, 'No—very seldom; but when it occurs I am not without resources;' and, pointing to the portraits on the walls, she added, 'I ask the friends you see to come down. I know the place that each preferred, the arm-chair in which he was accustomed to sit. I find myself again with Fox, Sheridan, Romilly, and Horner; they speak to me, and I am no longer alone.'

At the dinner-table Lady Holland's imperiousness was at its best—or worst. As Mr Sanders

tells us, she tyrannised over all who came in contact with her, including her husband; but it was all, perhaps, in the way of kindness. One time Lord Holland was not permitted to dine in a white waistcoat, which loomed large upon his portly figure, suggesting, as Luttrell whispered in an aside, the image of a turbot standing on its tail. His wife declared that she would not sit down unless he changed it, and he was obliged to comply. Again, he was duly relieved of his crutches when they had ceased to become a necessity and were employed as a matter of habit. 'Put away your nasty crutches, Lord Holland,' the lady exclaimed; 'you look as if you were in prison.' 'Oh, dear woman,' he appealed, 'pray, let me have them; I like to have them near me.' The answer was, 'Impossible!—Mary, take away your papa's crutches.' There was then a large party of distinguished people present, including the Dutch Ambassador. Her rudeness to those about her was not purposeless. Mr Sanders concludes properly that she would never have exercised her social autocracy for forty years had it not been instinctively felt that there was method and reason in her castigations, which were undeniably administered without fear or favour, so that neither the highest in the land nor the most confirmed habitués of Holland House escaped. We are told here that the greater lights expected to rule not only the day but the night as well. A dominant individuality and an occasional display of the whip were needed to preserve the amenities. Lady Holland intervened with the calm assurance of an accepted dictator; and, if her manner was insolent, she always respected those who stood their ground. At the fitting moment there came the tap of the fan on the table, and, 'Now, Macaulay, we have had enough of this; give us something else.' Did not Macaulay himself write of her, 'The centurion did not keep his soldiers in better order than she keeps her guests. It is to one, "Go!" and he goeth; and to another, "Do this!" and it is done. "Ring the bell, Mr Macaulay." "Lay down that screen, Lord Russell! You will spoil it!" "Mr Allen, take a candle, and show Mr Caradock the picture of Bonaparte"'?

Rogers used to relate how, one day when he was coming away from a call at Holland House, Lord Holland asked him, 'Well, do you return to dinner?' to which the answer was, 'No, I have not been invited;' and the question was settled, for her ladyship herself determined the constitution of her dinner-table. There was generally a crush of seats at it, and much careful arrangement was necessary. Lady Grey complained to Creevey of having to dine sixteen at table instead of nine, and Greville grumbled because Lord Melbourne and Tom Duncombe arrived there when there was no room for them, with the result that 'Lady Holland had the pleasure of a couple of general squeezes, and of seeing our arms prettily pinioned.' 'Luttrell,' she cried one day, 'make room;' to which he answered, 'It will have to be made. It does not exist.' Moore tells how an unfortunate Mr Gore was abruptly ordered to vacate his chair for some more favoured guest; and Lord Melbourne once rose in his wrath, after she had fidgeted him by making him change when he was seated to his liking, and walked off to his house with 'I'll be d—d if I dine with you at all!' And so on in the most agreeable entertainment.

A YARLSIDE ROMANCE.

PART II.

THROUGHOUT the routine business that afternoon, Martin Hill's mind circled round the letter he must write to his chief. Was he himself to place the damper down for ever upon the lingering glow of his life's hopes? He was forty-five years of age. The thought of his present pittance burned his face with humiliation. He knew that, in one sense, he was too good for the post. His whole soul loathed the infinitesimal detail for the infinitesimal ends. Then why was he there? Why had he never dared to 'get on' as other men got on? Where lay that fatal flaw in himself that condemned him to failure?

But was he a failure? His proud soul scorned the evil word. He had certainly never made money; but at least his name was known well enough in the archæological world. His opinion was asked for and treated with respect by officials at the British Museum and South Kensington. Members of archæological meetings were familiar enough with his grave white face and piercing brown eyes. They looked with respect upon his keen, intelligent questions, and depended upon his accurate knowledge. But then archæology was no money-making business.

So his leisure had gone in the intimate study of past ages, and his working hours in providing entertainment for the idle attention of an undiscriminating public. He had for long years felt himself gripped in a position he loathed, yet ever feared to relinquish. At least it brought him his bread and his books. But on this afternoon the whole waste of his life rose up before him with a torturing accusation of want of enterprise and initiative, an accusation of false pride, and—intolerable agony—of culpable unfaithfulness.

No, no! Anything but that last charge! At least he had been faithful! He had surely the right to refuse to bring the woman he loved into his own poverty. Twenty years ago he had told

her proudly that he would never come for her until he could come strong enough to keep her in comfort. So confident had he been in his own powers for success! And month by month he had watched for this success which had ever eluded him, until it had now come down upon him with an illumination of agonised remorse that she would be forty to-morrow. Her youth-time had passed, ere he was aware of it, in waiting for him. That his youth should have passed was of little importance, but that hers should have gone! He knew that she had never married; but he knew also that, ashamed of his own failure, he had actually ceased communicating with her for at least ten heartless years. Yet in the depth of his being he still thought of her as the girl who climbed the apple-tree one sunny September morning, and flung the fruit at his feet.

'A telegram, sir.' Edwards's quiet, startling voice again.

Martin opened it nonchalantly. It doubtless referred to endless copy.

'Will you accept Editorship of new *Archæological Journal?* Salary five hundred. Reply Secretary.'

'Ah!' So the unwonted ejaculation was wrung from him.

'Nothing wrong, sir, I hope?' asked the clerk concernedly.

'No, no, thanks. But I am going out to tea. Shall be back in half-an-hour if the editor wants me.'

Hill took down his worn coat and shabby hat, and escaped. Even a tea-shop held more privacy than that close little den of his, with the ever-present Edwards.

'Editorship of an *Archæological Journal!*' The vision danced before his eyes. The full blood was in him after all. Success, with laggard steps, had found him. Here was the one position flung at him which he felt he could take with honour. He took out his note-book, and over tea and toast drafted two letters of delirious import—the one accepting the proffered post, the other resigning the sub-editorship in the Imperial Publishing Syndicate.

Then he took out his pocket-book and glanced within. The girl's eyes smiled up into his, faithful as always.

His work at the office kept him late that night. Yet he had time to pack hastily, leave his address with his landlady, and catch the mail train north.

Martin Hill reached Farbiggin Station at about five o'clock, and was soon walking up the silent street of the little, gray-built town. Turning ever westwards, he at last gained the fell. Thin gray mist swathed his onward path. In the half-light it seemed questionable whether he would be able to track the two-mile route. But in his long archæological tramps he had often set himself worse problems; and, confident in his little pocket-compass, he disappeared into the misty depths as the town clock clanged six behind him. He attacked the mist fearlessly, and it cleared before him with a strange, ghost-like welcome. Walls loomed suddenly before him; he climbed them. Sheep started up clumsily; he passed them softly. Eastwards, from behind him, the sun was rising opaquely; and as he was watching eagerly for familiar landmarks, they approached him one by one. Gaining confidence, he walked faster, with quick, short steps, as a city-bred man walks. He found he had gone but a few yards astray when at last he gained the scar-face and gazed down into the lightening wood.

St Valentine's Day, and her birthday! Surely, at last, he and she might forget the years, and be boy and girl together!

He turned down the rocky track, and, stooping, bathed his face and hands in the icy beck. Then he smoothed back his thin hair and arranged himself sensitively.

A new misgiving oppressed him. After all, ten years was a very long time. He must not startle her. He walked slower. Yet in time he perforce reached the garden gate, and looked up at her window. Her blind was drawn back; her lattice was wide open to the crisp morning air.

As he stood there for a moment irresolute, she stepped out into the porch.

'Margaret!'

'Martin!' Her eyes stared and feared.

He advanced quickly, anxious to reassure. 'Many, many happy returns, dearest!' Somehow the words sounded all hollow and distant.

'But how'—— She threw out her hands, as though to keep back something from her. Then she turned, and he followed her into the tiny parlour.

Fearing intrusion, he closed the door upon them. She had seated herself on the low window-seat.

He came close up to her, longing to throw himself down close beside her; but there was something in the woman's attitude that withheld him.

'You are not angry, Margaret dearest?' he pleaded.

'Dearest!' So she flung the word back upon him, and rose to her full slender height. There was a wild passion of misery in her face that stung him.

'Dearest!' he repeated emphatically. 'Always dearest! Yesterday I succeeded, and to-day I have come as I promised.'

'Promised!' The word darted forth bitterly. She was trembling so that she was forced to sit down again. 'How dared you come?'

'Because—— Oh, won't you understand? We can marry now. Yesterday I had nothing to offer you. To-day I have an income'——

'Have you?' she interrupted. 'What a glorious fact! I wonder how much this income is, for which you have slowly strangled the soul of a woman for twenty years. Twenty years, Martin Hill, since you robbed me of my heart, and buried it deep, deep down in the years! Perhaps you have for-

gotten that years count up, one by one. I am forty to-day.'

He sank down on a low chair at her side. 'How I have wronged you! But you will forgive? It can't be that you will not forgive, Margaret? I know I deserve nothing—nothing; but you will come. You must come!'

'Must!' She drew out the word slowly. Her face was ghastly in its drawn whiteness. 'You have worked your own will; you have nourished your pride all these years. I also have nourished mine.'

'You mean'——

'If you could not trust me with your poverty, do you dare to insult me by bribing me with your wealth? I refuse to give away the ashes of my womanhood to any man. At least what is left is my own!'

She had begun to shiver violently. There was no fire in the grate. Her breakfast was spread in another room. There was a momentous silence between them.

Martin Hill's flushed face had paled also. Seeing this woman, he knew, indeed, that in every real thing that mattered in life he had failed.

During that silence the simple womanhood in her crept back. She looked at her visitor more quietly, and her expression calmed.

'You have come over the fell from Farbiggin? Then you will need some breakfast.' She rose and left him.

As he sat on, gazing furtively round the room, with all its old familiar objects, his crime against her rose up before him in ghastly detail. He heard her talking to her maid in the sweet depth of tone he remembered so perfectly. Preparation was going forward for his comfort. At least she was not going to cast him breakfastless from her door.

In a few minutes she returned, collected enough, perhaps a little ashamed. 'I am sure you must need something. Come, will you?'

She served the fragrant coffee, and helped him only too bountifully. She talked of little things, the journey, the weather, the outside news, the spring, and he tried manfully to second her efforts. Yet each, watching the other, knew that the meal and the talk were pretence and sham, and they learned accurately also what the years had done.

The meal was over at last, and the intolerable position must be ended somehow. Margaret Langton respected the effort the man made to cut the difficulty. It was he who rose first from the table.

'Then you would rather I did not tell you about it before I go? I must reach London again to-night.'

'Of course you may tell me anything you wish,' she admitted, rising also.

'Then, I wonder, have you still that little arbour in the apple-orchard?'

Her brow burned again, and a tenderer look would somehow creep into her eyes. Here was a hint of the old absent-minded boy who had once wooed her.

'You forget,' she said; 'this is February and winter.'

'No, I forget nothing. Get a cloak if you like, but call it spring.'

To get the cloak was at least an excuse to fly his presence.

'It is such a poor tale,' he began quietly—'so much poorer and more disgraceful than I ever thought it until I found myself here. Perhaps it would be better not to tell it at all.'

'I think you had better tell it,' she said.

So he told it, simply and truthfully, in all its weakness and cowardice, sparing himself no pang, no humiliating admission, until it was in her to cry out to him to stop. Yet she held herself in resolutely.

And at last he laid the momentous telegram on her knee.

'So, you see, my stupid, selfish hobby has led me to you in the end, if only to say good-bye. I see now that I have no right even to ask you to believe that in all truth I have loved you, and you alone, all through the years.'

There was the ring of a bicycle-bell in the lane, and they heard a voice saying, 'Any one of the name of Hill staying here?'

'A telegram!' she said. 'I will go.'

She sent the boy round to the kitchen to wait, and brought the telegram back in her hand. 'Life crowds in Yarlside,' she said quietly.

She stood leaning against the rickety arbour-support, trying not to notice as he read.

The paper fluttered to his feet. He rose and stood set and stiff, as though daring any one in all the world to approach him.

'Martin!' she ventured.

Her voice broke the tension. He threw out an awful, maddened curse.

'How dare you?' She shook him by the arm, and forced him back to the seat. 'What is it? Tell me!'

She stooped for the telegram, but he snatched it from her and crushed it violently in his palm.

'It is all right!' he laughed out wildly. 'You were quite right after all! Woman's instinct! Fool! fool! But if there be law in England—— Has the boy gone? Stop him! For Heaven's sake stop him!'

'Hush!' she said soothingly, nerved to an exaggerated coolness at sight of the man's abandoned passion. 'There is no hurry. He can wait for hours.' She seated herself beside him. 'Now, show me the telegram.'

He unclenched his hand, partly because of the authority in her tone, and partly because—well—nothing mattered any more.

She smoothed out the paper, and read it with a careful deliberation.

'Know nothing of any proposed new journal. Fear some practical joke. So sorry.—SECRETARY.'

Somehow he dared not watch her as she read. He leaned his cold, damp forehead down in his burning hands.

In a flash her woman's brain pieced up the whole tragic situation. He had thrown up his reality for a dream. He was penniless as on the first day he had wooed her.

'Who is your enemy?' she asked, with all the sharpness of pain in her tone.

'I did not know I had any enemy—except myself.' The words came out half-smothered from between the hands.

She waited thoughtfully, then said quickly, 'Who will get your post at the syndicate, now that you have resigned?'

He looked up, startled at her wit. 'Oh, well, Edwards, I expect. But you would never think'—— He was rising, as if then and there he would make a dash for Edwards's throat.

But she stopped him, pressing her hand firmly on his knee.

'Never mind. What does Edwards matter? You were saying, before we were interrupted'——

'But we were interrupted! That paper has interrupted us for ever! You could never think that I would press you further after that! Not even to say good-bye. I cannot forget you. To have seen you once more has been'—— His voice broke in spite of his savage effort. 'Of course I understand. It has all been my own fault. A man must reap as he has sown, and God help me not to play the coward!'

'Martin, why will you make it so difficult for me? Will you not listen even to one short sentence?'

'I beg your pardon.'

With the opportunity the words failed her. She wanted to tell him that she loved him still, that she had tried to kill her love, but had failed. She wanted to tell him—oh, so much! Instead, she sat there tongue-tied.

'What would you say?' he asked deferentially.

Their eyes met, and he grasped her hand so that she could have cried with the pain of it.

'Suppose, Martin,' she said hurriedly, 'that you still wish to go on with the true work the world needs of you, but for which it will never pay. Do you think you could love me well enough to let me be your paymaster?'

He looked hard at her, and she felt the pressure on her hand relax.

Desperately she spoke. 'I also had news yesterday—better, truer news than yours. I am a rich woman as our small world would think—eight hundred a year in addition to'——

'Where are you?' So called a shrill, eager voice.

Vicarage Teddy burst into sight, hugging a huge woolly bear in his fat arms. 'Many happy returns of you's birfday! Why, what's zat man doin'?' The child walked slowly, eying the stranger cautiously.

'Mr Martin Hill, Teddy. He has walked all the way from Farbiggin, and he is rather tired.'

'Are you? It's not sutz a welly long way, is it? My daddy can walk it, and he's not tired.'

'Perhaps I am older than your daddy.' Martin raised himself, and tried to speak in his ordinary tone.

'Oh, lots and lots!' said the child frankly. Then he suddenly plumped down his bear into Margaret's lap. 'I'se brought you Teddy-Bear for you's own self! Mummy said I might. Mummy said to daddy, "Poor Margaret! *suts* a pity she hasn't some one of she's welly own. So I bronght him. He likes bread-and-milk, and lots of sugar; and at night, if he cries for me, you must kiss him, and tell him I'll be back welly soon in ze mornin'. I've told him, and he says he'd like to stay wiff you, when you's got nobody of you's welly own. Oh, Miss Margaret, you mustn't czy! Teddy-Bear hates czyin' peoples, so mummy says.'

'Then I won't.' Margaret brushed back the foolish tear. 'But, Teddy dearest, I have got some one of my very own. See, he has come to me for my birthday!' It was she now who took the hand of the man, and held it fast.

Teddy stood back, put his hands behind him, and looked seriously from the one to the other. 'He's a welly old one,' he said dubiously. But immediately his eyes brightened. He relifted Teddy-Bear and nestled his nose under his own dimpled chin. 'Then *my* Teddy-Bear needn't stay wiff you, if you's got one of you's welly own.' He sighed with transparent relief. 'Which would you rather have—Teddy or you's welly old one?' He looked from her face to that of his treasured pet with exceeding anxiety.

'I would rather have the "welly old one," thanks, Teddy. Kiss me, my precious boy!'

The child cast Teddy-Bear ignominiously to earth, leaped to her lap, and hugged her tumultuously.

'May I have a kiss too?' asked the man sitting so near.

'Me or her, did you mean?'

'Both,' said the man.

'Me first, then.' Teddy bestowed and received a kiss with princely condescension—hurriedly, however, as though his mind had already wandered.

'Now, it's you's turn,' he said to Margaret. 'He can do it to you while I go and tell mummy that you doesn't want my Teddy-Bear, because you's got one of you's welly own.'

THE END.

THE MONTH: SCIENCE AND ARTS.

HARNESSING WIND FOR GENERATING ELECTRICITY.

IN this country the utilisation of windmills for the purpose of generating electricity has not attracted the attention it deserves, although it should offer an easy means of solving many difficult problems at present existing in remote districts in connection with light and power, as the periods of absolutely dead calm experienced in these islands are few and far between. On the other hand, in Germany and Denmark such installations are becoming quite common, owing to their ease of manipulation, efficiency, and economy. Considering that windmills are already extensively used here for raising water and performing other operations, the reluctance to adopt a more scientific means of utilising such energy is somewhat remarkable. The installation simply comprises the steel tower with vaned wheel, from which the power is transmitted by a vertical shaft to the power-house below containing the dynamo, and also a small petrol or oil engine as a stand-by to be used at those times when there is insufficient wind to drive the wind-turbine. Considering that with a light wind six horse-power can be furnished, one is practically sure of the apparatus being in action for quite 90 per cent. of the days in the year, so that the demands upon the oil-engine are very slight; while during the period the wind-turbine is in operation electricity is being generated practically for nothing. The electrical equipment is provided with suitable automatic devices to prevent overdriving, so that when the wind attains too great a velocity only sufficient is consumed by the dynamo to meet its maximum output requirements, or it may be disconnected altogether during such heavy stresses of weather as storms. Owing to the substantial nature of the windmill, it can withstand the heaviest wind-pressures without any tendency to collapse or be thrown out of alignment. The cost of installation naturally varies according to locality of the site and capacity of the plant; but a fair impression may be gained from the results attending the operation of a small plant at a private country-seat in Germany. This particular installation, which furnishes from six horse-power with a twelve-foot wind to about thirty horse-power with a twenty-four-foot wind, displaced a twin petrol-driven set. The cost of the wind-turbine, complete with accumulators, was nine hundred and eight pounds, and the stand-by petrol-engine cost another six hundred pounds, which, with other incidental expenses, made a total capital expenditure of sixteen hundred and thirty-five pounds. The petrol installation which it displaced cost about six hundred pounds less; but this difference in initial outlay is more than compensated for in the reduced cost of operation, for whereas the purely petrol-driven installation cost three hundred and thirty-eight pounds to maintain per year, the wind-turbine set only costs two hundred and twenty-seven pounds. This striking difference in operating charges is primarily due to dispensing with skilled attendance which was formerly necessary, coupled with decreased consumption of petrol. So effective is the system that it has been found possible to rely on the wind for as long as ninety days at a stretch, without once calling the petrol-motor into service. In view of these circumstances it is perfectly obvious that in these islands the more extensive application of such a system would prove highly successful, since the energy thus procured can be transmitted to the most remote parts of a farm for both lighting and power.

PICTURE POST-CARD PROJECTING-LANTERN.

A recent invention which should do much to increase the present popularity of the pictorial post-card is a reflectoroscope, by means of which the illustration may be thrown upon a screen in precisely the same manner as the ordinary lantern-slide. Nor does the operation necessitate any resort to photography. Instead of the light being transmitted through the picture and lens on to the sheet, the image is thrown by reflection. The apparatus resembles the favourite magic-lantern of our young days. The post-card is placed at the back of the lantern, and the rays of an exceedingly intense light are concentrated thereon from two reflectors, and the image is thus projected on to the sheet. Various efforts to secure such a result by this means have been made, but hitherto have proved abortive, because it was not found possible to obtain a sufficiently powerful light for the purpose. In this case, however, a special burner has been evolved which with gas and incandescent mantles yields a beam of three thousand candle-power. The result is that the illustration on the post-card is reflected on the sheet with brilliancy, clearness, and splendid definition in all its colours. It is equally applicable to monochrome illustration, and should be of decided utility to photographers, who may obtain the same magnified results from their prints, produced by any process, as if they went to all the trouble and labour of preparing glass lantern-slides. Even pictures printed in newspapers and books may be projected by this means with equal success. Any system of illumination, such as petroleum or electric light, may be used; but gas is recommended, and therewith the operation costs only one farthing per hour. It is a highly ingenious scientific apparatus, and, as its cost is within the range of all, should meet with wide popularity.

AN INGENIOUS RAW-MEAT JUICE-PRESS.

Probably every family has experienced at some time or another the need of the raw juice from a

piece of meat for either dietetic or medicinal purposes. An invention to obtain this comprises a circular vessel with an orifice at the base containing a series of corrugated metal discs a trifle less in diameter than that of the interior of the receptacle. The latter is closed with a tight-fitting lid carrying a screw which forces the plate to which its lower end is attached down into the vessel. The operation is equally simple. The meat is cut into thin slices of about two inches diameter. A disc is placed at the bottom of the vessel, then on top of this a piece of meat, followed by another disc, upon which in turn is inserted another piece of meat, and so with alternate pieces of meat and discs until the vessel is filled, when it will contain about three and a half ounces of meat. The uppermost layer is a disc upon which the cover is placed and secured. The screw is then turned, and the pressure of the corrugations upon the meat forces the juice from its cells, which flows along the grooves and then falls to the bottom of the press, being drawn off through the orifice at the base as required by simply tilting the apparatus. By twisting the screw gradually the juice is made to escape in a steady stream until practically the whole of the fluid content of the meat has been driven out. From one charge of meat about one and three-quarter ounces of juice can be extracted, which is about five times as much as is obtainable with the ordinary types of presses. The vessel is thoroughly hygienic. All parts coming into contact with the meat are of nickel, which is unaffected by the chemical constituents of the fluid, while neither rust nor corrosion can result. Moreover, it dispenses entirely with the old-fashioned linen bag or pressing-cloth, and 50 per cent. of juice is obtained.

PRESERVING WOOD FROM DECAY AND VERMIN.

One welcome tendency in modern building and decoration is a reversion to the more extensive use of wood with a view to reproducing a twentieth-century modification of medieval picturesque timber embellishment. Our ancestors, however, made extensive resort to the sturdy oak or other well-seasoned hardwoods; but in these days of commercialism the softer woods are pressed into service. To arrest decay, ensure preservation from verminous attack, and impart an aspect of age to the material, careful selection of the medium with which the wood is to be covered is required. Remarkable ingenuity has been devoted to the elaboration of a substance in which these three indispensable conditions are efficiently fulfilled, but it has proved no easy task. Possibly the best results that have been secured are embodied in the preparation known as 'solignum,' the possibilities of which have been demonstrated at various exhibitions recently. It is a fluid composition, applied in the usual manner with a brush, possesses great covering capacity, and, what is more important, improves with age both in appearance and resistant qualities. Interior and exterior woodwork executed in the brown shade of this preparation assumes a pleasing solid character, and for this reason it is being extensively adopted. For tropical use it is equally advantageous, as it offers a certain protection against the attacks of the white ant and other destructive pests. Recently the preparation has been devoted in a modified form to the preservation of brick and stonework with similarly marked success. For this class of operations it is practically transparent, and sinks right into the surface of the material, the exterior of which, as it were, armours the more susceptible interior. For the resistance of damp it is superior to asphalt, and its use upon outside walls liable to percolation or penetration by driving rain and moisture is preferable to the disfiguring tar so often used for this purpose. Recently, too, it has come into extensive vogue for the staining of floors, in which connection it should have great possibilities, since, unlike the ordinary stains used for this purpose, which are of the water variety, it does not wear off, but retains its appearance irrespective of the extent of traffic, whether the surface be subsequently varnished or left in its original condition, requiring only periodical rubbing down with Baltic linseed-oil as a cleanser, which also assists materially in the maturing of the stain.

MODERNISING A THREE THOUSAND YEAR OLD INDUSTRY.

To introduce modern scientific methods into an industry which is practised to-day upon exactly the same lines as it was three thousand years ago is an experiment which is exceedingly bold, especially as it is uncertain whether modernisation will actually bring about the required improvement. Yet such a development is being effected in connection with the pearl-fishery of Ceylon. When this monopoly was leased to private enterprise by the Government in return for a specific annual rent, it was further stipulated that the concessionaires should expend the sum of two hundred thousand pounds in improvements for the purpose of obviating any possibility of the ultimate disappearance of this gem-yielding mollusc and rendering the fishery more regular. In the past, years of abundant harvest have been followed by periods of barrenness. Under such circumstances the supply of these highly prized jewels has been very intermittent. The improvements contemplated comprise the artificial preparation of the sea-bed, or 'cultching,' as it is called, with suitable materials to which the spat can make itself secure, and the removal of any possibilities of its dislodgment therefrom by storms and tidal currents. This is no easy matter, since operations have to be carried out over an area of twenty-five square miles, upon which thousands of tons of cultch are to be dumped. Then, again, it has been found that certain small localities are peculiarly adapted to the fruitful cultivation of the spat, but while it is maturing it so densely crowds the bank that the bivalves, through

lack of space, cannot develop properly. Transplantation is consequently being resorted to; but here also the matter is one of supreme difficulty. In dealing with these oysters one has to calculate in hundreds of millions, for a single bed will contain over four hundred million young oysters. Marine biological science has not yet evolved any means of picking up the spat in bulk without seriously disturbing the molluscs' resting-place, so that, pending the production of a suitable apparatus therefor, the work is being carried out by hand by the native divers. Search is also being made for new banks, since, as the same areas have been regularly fished during the past thirty centuries, they have become somewhat depleted, and it is necessary to cast farther afield. Success has attended this effort in a remarkable degree; but an obstacle exists in the depth of water in which the beds are revealed, as the native diver's limit of working is about fifty-four feet, and anything exceeding this maximum is practically unavailable, unless further improvements are effected in diving engineering.

THE EVILS OF UNNECESSARY NOISE.

The campaign is being continued abroad against unnecessary noise caused by unscientifically constructed road-vehicles, church bells, cries of itinerant vendors and musicians, sirens and whistles, motor-propelled cars which receive imperfect overhauling, and the units of which in motion consequently set up such a jarring, clanging sound that every moment presages the precipitation of the internal mechanism into the roadway. Probably New York is the noisiest city in the world, but recent legislation has done much to reduce the noise. Any citizen can invoke the law in protest against screeching parrots, yelping dogs, wheezy, scratching phonographs, and so forth, while special inspectors are detailed to spot the flat wheel of the tram-cars, which is a particularly serious offender. In one month no less than one thousand five hundred and sixty-eight flat wheels were condemned and ordered to be removed. In St Louis bells must not be used for calling attention to wares, steam whistles are forbidden, street music is barred, and penalties against any other unnecessary noise are relentlessly enforced. In Detroit even the whistling of trains and boats is strictly limited to a certain code. Washington is still more stringent, while in Baltimore all kinds and grades of steam whistling is prohibited between 6 P.M. and 7 A.M. On the Continent the agitation is equally aggressive. The piano-fiend has his hours of practice limited in Berlin, where the street-organ has been banished for nearly a quarter of a century. The small towns of Prussia limit the performances of street bands to one day a week, and even then the instruments have to pass the searching test of an officer. Similarly, gay Paris is wrestling with the problem, and the first step has been the prohibition of street music in every form. Zurich is endeavouring to enforce a 'curfew' for church bells, which are an intolerable nuisance in that city. The hospitals protested against the clamour they create every half-hour between four and seven in the morning, and appealed to the legislature. It must be admitted that the church bell is a distinctive contributor to the general din, but were its summons to its adherents only issued during the day the average person would not so much object. In the Spanish port of Bilbao even this concession is not granted, on the plea that bell-ringing is quite out of place in a modern city. In all the large towns in Britain there is also far too much nerve-racking, unnecessary noise.

A DRY PHOTOGRAPH-MOUNTING PROCESS.

By means of a recent invention, the ordinary method of mounting photographs with some form of wet glutinous paste may be dispensed with. This is a dry, adhesive process comprising a thin sheet of stout tissue-paper very similar in appearance to tracing-paper. The paper is inserted between the photographic print, which has been thoroughly dried, and the mount. All that is then necessary is to apply a little pressure with a heated iron, which dissolves the materials with which the inserted film has been impregnated on both of its two surfaces, so that the print is caused to adhere tightly to its support. The process is applicable to the mounting of photographs upon any material with equal facility. The simplicity of the operation is obvious, and it enables the work to be carried out very rapidly. In large establishments the work is accomplished by means of a machine; but the amateur, with his two or three prints to be mounted now and again, can secure the same results with a heated domestic flat-iron. The application of heat in this manner has a burnishing effect upon glazed prints; but, on the other hand, the distinctive surface and grain of other papers, such as platinotype, are unimpaired. Should it be desired to unmount the print, this can easily be achieved without inflicting any damage. The process is already in operation in most manufacturing photographic establishments.

A NOVEL CINDER-SIFTER.

To the frugal housewife a handy and novel little device which will reduce domestic labours and assist in the more economical use of fuel will doubtless commend itself. This is a new type of cinder-sifter, which permits the operation to be carried out in the room, thereby averting unnecessary journeys. It comprises a small circular vessel about twelve inches deep by some eleven inches wide. Near the top is a projecting circular band on the inside, upon which rests a sieve or riddle so inserted that it can be oscillated to and fro by means of a small handle projecting through a slot in the outer case. The contents of the grate are emptied into the riddle and the lid placed on top. By giving the projecting lever a few movements to and fro the riddle is

agitated, causing the dust to fall to the bottom, when the sieve is lifted bodily out and the cinders replaced in the grate. The design of the appliance prevents any dust from escaping into the room, while there is an absence of waste, and the sifting movement is such as to require but slight physical effort. The device is of sufficient capacity to deal with some ten grates before requiring emptying of the ashes. The considerable wastage in fuel which at present exists in connection with the domestic fire-grate through the discarding of partially burnt coal can successfully and easily be avoided by this natty little contrivance.

LIFE-SAVING EXPERIMENTS BETWEEN SHIP AND SHORE.

The greatest recent success in such experiments was probably attained by the aerial torpedo, which is the invention of Lieutenant Unge, of the Swedish army, and which, curiously enough, was designed as an engine of destruction. Experiment proved its efficiency in this respect in a potent manner, but it has been turned to striking advantage in a more humane field of usefulness. Briefly it may be described as a very improved rocket, minus the tail. It comprises a small circular steel shell a few inches in length, filled with a slow-burning compound, the gases of which in combustion escape through the blades of a small turbine carried at the lower end, imparting not only the forward-propelling motion, but a high rotary action as well, which ensures accuracy of flight. The projectile is not fired from a cannon or mortar, but rests idly in an inclined open trough. It is fired with a fuse at the nose, and the ignition of the non-explosive compound within immediately sets up the revolution of the turbine. As the torpedo shoots up the trough it catches in its flight a loose ring, to which the life-line is attached. The tests proved the projectile to be possessed of long range and remarkable accuracy in flight, being fired to a distance of three hundred and sixty yards, and striking the target. A notable point in connection therewith is that, unlike the majority of such devices, the line carried is sufficiently strong in itself to be used for the breeches-buoy, so that no time is lost after it has been secured in commencing the passage of the unfortunate persons upon the wreck to the shore or to the deck of a friendly vessel.

THE DULCITONE.

The dulcitone is a musical instrument on the lines of the pianoforte; but instead of the sound being produced from steel wires, as in the pianoforte, steel forks (like tuning-forks) without shanks are substituted, which are acted upon by the key-hammers. A special feature is the conveyance of the vibrations from each fork to the sounding-board by means of a semicircular steel spring. The mechanism is a down-striking one, and the keys, weight and depth of touch, repetition, and damping are all exactly in agreement with those of the piano. No tuning is required. The tone, though not loud, has great sweetness and carrying power, and is effective both for solo playing and as an accompaniment to other instruments or the voice. These qualities and its portability are amongst its chief recommendations. While the five octave piano weighs two hundred and fifty pounds, the dulcitone weighs but forty-three pounds. It is the invention of Mr Thomas Machell, Glasgow.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

AN INCIDENT OF THE YANGTSE.

FOR the last three days and nights the puny engines of the Hankow river-steamer had been battling against the current of the mighty Yangtse. From the dismal mud-swamps of Shanghai we had gradually steamed our way through the rich, fertile country, stopping to take up the native passengers now on the right bank, now on the left, until the deck beneath us was packed with humanity, and we were heartily tired of the swirling yellow stream and the teeming yellow crowds.

On this, the third day, we were in the neighbourhood of Kiu-kiang, where the great river flows through a more mountainous region. On either side rise dark cliffs; in mid-stream rocky islands heave high up, crowned with quaint pagodas and Buddhist temples; while away to the north-west you can see the summits of the Muling Mountains towering into the brazen sky. The heat was intense. All day long the burning rays of the summer sun poured down on us, rendering the deck unbearable and the tiny saloon a fiery furnace; and at night we seemed to move on the face of the waters through a moist, almost tangible, heat that left us listless and inert.

Of the four European passengers, three of us had travelled up from Shanghai; and, in spite of the climate, the smells, and mosquitoes, we had managed to pass the time as pleasantly as possible. There was Lieutenant Haylett of the China Squadron, a naval officer of some thirty years, who was travelling up to Hankow; young Lewis was coming out for the first time to an up-river Consulate; while I was returning from leave in England to my occupation in the

Imperial Customs, amid the din and stinks of a Chinese city.

The fourth and last was a poor, degraded wretch who had come aboard at a village above Wu-hu, in company with a single native servant. In diametrical opposition to all unwritten laws of the East, he—a European—had been ferried out in the public boat in company with the natives to meet the steamer, had clambered on board with the rest of them, and then had demanded his rights as an Englishman to a cabin on the upper deck. Although we were not favourably impressed with the first appearance of our fellow-passenger—for he was unkempt and dirty, and, moreover, seemed in an advanced stage of *delirium tremens*—no objection could be raised; and so, after paying the compradore, he took possession of the remaining cabin. Here, to our relief, he remained, attended only by his faithful 'boy,' who kept him supplied at frequent intervals with brandy, and sought to calm his more violent ravings.

No one knew his name or his original occupation, and the only person who vouchsafed any information about him was a Protestant missionary, a worthy man who wore Chinese dress and a pig-tail, and lived on the lower deck with the natives. 'I wonder who the poor fellow is,' he remarked to us. 'I have met him up-river somewhere, but he would not allow me to do anything for him.' We imagined him to be one of those unfortunates who, having been dismissed from office through drink, stay on in the country, and live almost as the natives. It appeared he was wandering up and down the river, stopping at filthy native inns and keeping himself alive by brandy.

It is no pleasant thing to see a white man 'go down' in the East, as the chances of his ultimate redemption are few—very few indeed. If he is not sent home at once he soon sinks very low, and when his self-respect is gone, and he is 'left and abandoned of his velvet friends,' he soon becomes an object of contempt and loathing. Despised by foreigners and natives alike (for the vice of drunkenness is abhorrent to the Chinese mind), he slinks away, a forgotten pariah, and seeks to hide himself in dark and unclean places.

Idly we speculated as to the ultimate end of 'the Drunk' (as we called him for want of a better name), pitied his plight, and when his ravings disturbed our slumbers we swore, and then forgot him altogether.

It was, as I have said, the third day of the voyage, and we hoped, if the gods were favourable and put no inconvenient mud-bank in our course, to land at Hankow on the next day. From that port, a short journey would take me to my occupation, and then the old routine would begin again, with all its interest and annoyances.

There is something singularly attractive in the very last day of leave, something to which one clings with a feeling of affection, and always reminds one in some vague, obscure way of the lightship at the Nore, which, as it winks its last good-bye on the starboard quarter, seems to the outward-bound passengers the final tangible link with London.

Gradually the burning sun crossed the firmament above, scorching and blistering the paint-work and accentuating the fetid smells of the creeks, until at last it sank reluctantly behind the flag-pole at the bows, where the Red Ensign drooped and quivered. The deep, dark-blue of the summer sky gave place to a paler hue, and then, with all the suddenness of the East, the friendly stars came out and twinkled.

Late that night we were sitting on wicker-chairs on deck, commenting on the bitterness of things in general; after-dinner bridge had ceased, the captain had long since turned in, and we were too lazy to seek our respective cabins.

With perhaps some vague forebodings of a new life in a new country, Lewis, fresh from an English public school, had lost his customary cheerfulness, and was depressed and moody, and I could not help thinking of the five more weary years which would have to roll before I should see again the white cliffs of Dover rise from the blue of the English Channel. In this tiny steamboat, and on this mighty river, we felt ourselves exiles indeed, and so we began to talk, as men will in the East, of the good old days in England: of the lights of Piccadilly Circus, of the hansoms jingling down the Mall, of glorious runs in the Hunting Country, of Devon rivers and breezy uplands. And so, touching now on one topic, now on another, we gradually came to things more intimate; and, whether it was due to the influence of the Eastern night or the fact that we were the only Europeans for miles around, the great barrier of reserve seemed lifted up, and, although only the chance-acquaintances of half a week, we found ourselves talking as friends together of our lives, our aims, our hopes.

The subdued murmur of voices that rose with the fumes of opium from the deck beneath us, and the rhythmic beat of the engines, were the only sounds to disturb the stillness of the night as we plodded onwards under the canopy of stars. It must have been long after midnight when Lieutenant Haylett began to tell us his reason for travelling up the Yangtse.

'Lord Sanderdale—you know his place in Sussex—well, his youngest son was my greatest friend. My father's estate marched with Sanderdale, and we were often together in those early days.'

He paused to light a fresh cheroot, and I saw his face, illumined for an instant by the glow of the match, soften at the memories of his boyhood's years.

'We were left pretty much to our own devices, he went on, 'as I was an only son and Jim was the youngest of many brothers. I don't think he had a very good time at home. It always seemed as though he had arrived too late, and wasn't wanted.

And as his father and elder brothers snubbed him on every possible occasion, he grew out of sympathy with them, and used to try to avoid them by staying with us for weeks together. Lady Sanderdale died when he was about thirteen, and that made matters worse at home; for, poor old Jim! he was always his mater's favourite.

'He grew a bit wild after that—due, I suppose, to lack of family influence; but he was as straight as a die, and no end plucky. He saved my life once. It was near Chanctonbury Ring, on the top of the Sussex Downs. There was a sou'-westerly gale in the Channel, and the wind along the ridge of the Downs was enough to blow the hair off your head. My pony took fright, and bolted with me straight to where the cliff sheers off to a disused chalk-pit, with a clear drop of ninety feet below. I could not have altered his course for a million; but, just about ten feet from the edge, Jim suddenly charged down and stopped us dead. No, I wasn't hurt; but—his pony's neck was broken.

'About three years afterwards he went up to Oxford and I came out East on the *Archimandrite*. He was the first person to meet me on my arrival home, and he told me he was leaving the country. He had played a bit fast-and-loose at Oxford; but the climax came one night when he got drunk at Sanderdale, and his father, the personification of respectability, gave him a hundred pounds and told him to shift for himself.'

Haylett rose from his chair, leaned over the taffrail, and gazed into the darkling river beyond. Away on the bank twinkled the lights of a native village, and softly over the water came the quavering notes of a high-pitched Chinese song.

'What became of him?' asked Lewis quietly.

Haylett resumed his chair. 'A friend of the family was a partner in a large tea-factory in Hankow, and he offered him a position as book-keeper. Poor old chap! it wasn't much in his line, but he went out at once.

'I saw him off at Tilbury, and he promised to let me know of his movements from time to time. The last letter I had was four years ago, and since then I have been away from England. I had hoped to have got up the Yangtse sooner; but we have been stuck in the Mediterranean, in the Persian Gulf, Vancouver, the Bermudas, and elsewhere, and at last I got on the China Station.'

A shuffling noise behind caused us to turn our heads, and we saw that 'the Drunk' had crept out of his cabin, and was waiting his turn to speak. He stood in the full light of the saloon lamp, swaying upon his feet, with tangled beard and dirty linen.

Lewis moved uneasily and half-rose from his chair, and we felt that the jarring note had been struck, that the harmony of the night was broken, and the old barrier of reserve came down again.

The poor wretch began to talk in a voice painfully assuming the rights of fellowship—painfully off-hand as one who expects and means to resist a refusal: 'I say, I want you fellows to do me a small service. One can't trust these yellow brutes, you know. I have been feeling very ill; it must be this accursed climate, and—and I may be much worse to-morrow. Will one of you post this letter at the British post-office at Hankow—a letter of repentance to my father from the prodigal son?'

The letter fell from his nerveless hand as he spoke, and lay in the circle of light between us; and, with a gasp of horror, I saw the address: 'To the Lord Sanderdale, Sanderdale Towers, Sanderdale.'

'My God!' The exclamation came from Lieutenant Haylett, who had been watching the speaker narrowly, and I turned and saw that he was as pale as death. I remember the scene so well, and it has recurred to me on many a lonely night in after-years: the staggering figure of the drunkard; the pale, set face of Haylett, as he strove to realise the position and say some words of comfort; the perplexed, embarrassed face of Lewis; and, over all, the deathly, sickening stench of opium.

And then James, son of Lord Sanderdale, fell in an inert mass on the deck. We knelt to his aid; but years of privation and debauch had told upon that wasted frame, and we saw that the Angel of Death had passed and claimed him.

. . . . . .

Some two hours afterwards the gold ball of the sun peeped above the stream astern, glinted on the brass-work of the steamer, and turned the muddy river and the swirling *chow-chow* water into one blaze of crimson glory. And then we knew that the Night of Death had passed, and that another sweltering day had come.

NANGA PARBAT MOUNTAIN AT DAWN.

All fairy-like and far away
The dome of Nanga Parbat gleams
Across the mists of opening day—
A place of unsubstantial dreams.

The great, gaunt precipice below
Is one with the soft sky. Above,
The cruel miles of ice and snow
Hang floating like a tender dove.

So may life's distant retrospect
Seem to the earth-freed spirit's gaze,
With calm, majestic beauty deckt
And lit by love's eternal rays.

NEVILL ELIOT.

*** TO CONTRIBUTORS.

1st. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'

2nd. For its return in case of ineligibility postage-stamps should accompany every manuscript.

3rd. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, *should have the writer's Name and Address written upon them* IN FULL.

4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

IN THE PRIMROSE-TIME.

By C. EDWARDES.

CHAPTER I.

INSTEAD of obeying his father this Saturday afternoon when the brass-foundry was closed, Albert Chinley obeyed a mysterious whispering Somebody inside him. There was a soft westerly wind, and the Somebody suggested not only that the greening country would look charming on such a blue-and-white day, but that he might again chance upon a certain young lady with wayward brown, wind-kissed hair.

'Take your cousin Elizabeth for a walk, Albert,' said Albert's father gruffly when the jam-dumpling was done with.

'I don't particularly want,' said Albert slowly.

'It don't matter,' said father, 'whether you want or not. Business is business all life over, and the sooner we have your cousin's two thousand pounds in the works the better for us three parties concerned. You're six-and-twenty, and it's time you married. Elizabeth's as level-headed a wench as there is.'

Elias Chinley heaved a chair round to the fire and took out his pipe. He was as nearly satisfied with himself as he generally was. His word was law in the small world of his immediate environment, both at the Chinley Foundry in Wazeley Street and at home.

Having filled his pipe, father looked round. 'What are you wasting your time for?' he asked. 'When I was your age I didn't want telling twice to be after your mother. I enjoyed myself according to nature. Bring her to tea when you've tired her. There's no nonsense about Elizabeth Price. It does me good to talk to such a sensible person.'

'Well,' said Albert, 'I'll be off;' and he made for the door. He was accustomed to his father's despotism, but seldom coloured as now, even when it showed so humiliatingly for him. The suggestion of a smile preceded the blush. It had followed that allusion to his cousin Elizabeth and enjoyment according to nature. He might have made an uncivil retort. Elizabeth was not amiss as a remote cousin on his mother's side, but even upon that footing the less he saw of her the better. As for marrying her, it gave him secret shudders to think of it. And as for enjoyment in the natural processes of courtship, it was inconceivable with Elizabeth.

'That's right,' said father; 'and don't be so backward with her. She'll never be twenty-nine again, and she's beginning to know it. I'll send out for some muffins ready. We'll put tea at six o'clock, to give you plenty of time with her.'

Albert made no comment. He went down the suburban street with uncertain steps, and it was then that the Somebody inside him started its tricks. He never *had* treated his cousin Elizabeth as a sweetheart, and, Heaven helping him, he never would, for one father or ten fathers. The Saturday a fortnight ago among the Gorry Bridge primroses had firmly rooted this resolve in him. And now, after scant resistance, he yielded to the agreeable promptings of this internal Somebody. 'Why not run down and endeavour to see her again?' urged the Somebody; and, tightening himself upon his gold-banded gorse-stick, Albert said, 'I will.'

He waited twenty minutes for the next train, but once off he became feverish. Cousin Elizabeth hadn't a look in at his heart now. While he stared at the leafing trees and glinting brooks of the landscapes he recalled the details of that ramble by the rippling Gorry a fortnight ago. She was singing when he caught her in the lane between the stream and the steep red-sandstone slope, and the breeze rumpled her hair above her pretty ears entrancingly. She had dropped a bunch of primroses, and, with unconscious artifice, Albert first picked them up and then asked her if they were hers. The question seemed to her very amusing. She had blue-gray

[*All Rights Reserved.*]

eyes, a small straight nose, a mouth all smiles and close-set little white teeth, and in her chin was a dimple. The woods were packed with primroses, she said. She had thrown those others away because they were bruised. She had sat upon them.

Mischief ensued. If he would like to see where the finest primroses in the district were to be found, she would show him. She did. They had to push through a bramble of bushes and alders to the water-side, and there, on a six-inch path, hidden from the road, they meandered while she picked and picked for him. It seemed as keen a pleasure for her to pick them as for him to watch her. She thought nothing of it. Stooping didn't weary her at all; she had a strong back, she said. She had lived in the country all her days, and hated it—except in the spring. He, of course, belonged to the town, she judged. He looked it—so grave, and with such a clean collar, handsome necktie and gloves, and especially such a walking-stick.

The adventure ended at the old black bridge where three roads met.

'Here they are!' she exclaimed, offering him the fresh nosegay. 'Throw those rubbishy ones into the water. That's my father at the door.'

Albert had already, in the townsman's way, admired the lonely cottage by Gorry Bridge—a half-timbered little gem of rural picturesqueness, with creepers over it, a garden before and behind, and a budding orchard on one side. A mineral-water intimation and an 'apartment' card were in its windows.

Albert himself had then returned reflectively to the railway station. But so far from abandoning the primroses she had spoiled by sitting on, he wrapped them in his pocket-handkerchief, and had them still in a locked drawer.

And so here he was again. Wallflowers and daffodils graced the cottage garden, the orchard was white with pear-blossom, and the 'apartment' card was still in the latticed window. But he was not so brave as he had imagined. He did not even enter and ask for lemonade. A vexatious timidity drove him away and up into the woods which screened the brook from the north winds. That 'apartment' card made his mouth water. What bliss to spend even a mere week-end under the same roof with her!

He was just realising that he had gone far enough, and might sit down among the primroses and hazels and watch for her, when he espied something. A pair of tiny bronze boots, side by side, their toes pointing at the sky! Climbing on cautiously, Albert discovered an entire human being fast asleep in the sunshine. More still, it was She! Her head was pillowed in her hands, and primroses were all round her. The twigs of a tree made a dancing shadow on her face, which, thus diapered, at first seemed to move. But, holding his breath, he understood that it was only the dappling of the breeze.

She was even lovelier than his stored memory of her. With lips parted like her own, and trembling from head to foot, Albert felt as he felt when he was near the altar in church. And then a sacrilegious temptation came over him. One Sunday last autumn his cousin had fallen asleep in the home-parlour, when he and she were left together, and father had entered and imperiously demanded—before Elizabeth—why he had not taken proper natural advantage of his cousin's lips thus at his mercy. He had parried the question with the utmost difficulty.

He remembered the incident now, and—longed. He dropped upon one knee. It was an utterly reckless moment. He stooped until he could feel her warm breath. And then his chivalry prevailed. Whispering 'No, it would be too bad!' he sat and looked at her. This privilege he might at any rate share with passing birds and the sun.

A little more, and he slipped away down to the road and the pretty cottage which had become a temple to him. He introduced himself to the white-whiskered old gentleman whom he had already seen. He drank a bottle of lemonade, but not because he was thirsty. He said he wanted to spend a few days in the country by-and-by; and he proposed to begin with a week-end next Saturday.

The old gentleman's name was John Hollowbone—an odd name, at which Albert did not smile. He was in every respect accommodating. The terms would be nine shillings from Saturday to Monday, and he was sure his 'darter' would do her best for any visitor.

'Capital, Mr Hollowbone,' said Albert faintly; 'you may depend on my coming.' He shook the old gentleman warmly by the hand. At the door he was reminded that he owed twopence for the lemonade. It made him laugh nervously, and the old gentleman also laughed.

'That's all right, sir,' he said when Albert apologised. 'My darter Jenny tells me I'm boun' to be spry wi' folks.'

'Certainly, Mr Hollowbone,' said Albert. 'It's the only way. I shall look forward to Saturday. About three o'clock.'

He went off with the word 'Jenny' in his heart. It was a perfect name for her. Dear, lazy, lovely little Jenny, sleeping in the sunshine!

CHAPTER II.

THE Fates were kind to him this afternoon. They not only gave him his desire with Jenny, but even while he was meditating how to excuse himself to father about Elizabeth, he met Elizabeth herself. It was a quarter to six, and home was at hand.

He greeted her with respect rather than affection,

and mentioned father and the muffins. 'I was to have called for you,' he said, 'about three.'

Cousin Elisabeth had a long nose with the outline of a candle-extinguisher. She turned it at him sharply. 'Well, why didn't you?' she asked, also sharply.

'I found I couldn't. The governor will be down on me. I wonder if you'd let him think we've been a walk? But it's too much to ask.'

'Oh, you silly boy!' laughed Elizabeth. 'I shouldn't have gone with you, so there's no harm done. You're too simple, Albert; I detest such simplicity in a man. You're a funny pair, you and your father.'

'I don't understand you!' said Albert, trying to bridle a little.

'And never will,' said Elizabeth. 'But we mustn't disappoint Mr Chinley and his muffins, bless the man! And you may leave all the explaining to me, on one condition.'

'What's that?' asked Albert, instantly suspicious.

'That you don't make a martyr of yourself trying to entertain me afterwards. Go and play billiards at the club.'

He promised. It cost him nothing. And for once he felt almost tender towards Cousin Elizabeth when he had accompanied her indoors and heard her promptly drive home the insinuation that they had had a pleasant and sufficiently long time together.

He was a cipher at the tea-table. Elizabeth and father talked town's matters and politics like two men, and ate muffins. And presently Albert rose and hurried to the door. Father called after him, but Elizabeth's voice intervened. 'Let the poor boy go, Mr Chinley!' she said, with a note as of pleading and laughter combined.

Save for his earlier excitement of the afternoon, Albert might well have meditated about Cousin Elizabeth's peculiar tactfulness and complacency. He had better food for thought, however. It was 'Jenny' all the time, or nearly. Nor when he came home at ten o'clock did father bring him to book for his unruly flight. He expected to feel the rough side of father's tongue, but nothing of the kind. Indeed, father was the first to retire, after an extraordinary spell of silence and fire-gazing.

'You can put the lights out,' he said gruffly; not another word, even about Cousin Elizabeth!

And so a new week began. It was a week of heart's travail for Albert. Each day brought him nearer to the week-end and all it might mean for him; but it was not until the Friday that he gave father any hint of his presumption. On the Friday evening he brought a fishing-rod to tea.

'What's that thing for?' asked father.

'It's for fish,' replied Albert. And then his courage took the bit in its teeth. 'I'd like to spend Saturday to Monday in Worcestershire, if you don't mind, sir. I haven't had a change since Christmas.'

Father burst into no temper. 'Let's have a look,' he said. He pieced the rod and flicked its taper tip at an enlarged, and unflattering, portrait of himself in a distant corner. 'H'm!' he then said; 'what stream do you think of fishing?'

'The Gorry, by Acton Carne. It looks very decent.'

'For two straws,' said father, 'I'd come with you.'

Albert could have choked. For two straws! The horrible prospect! His tongue clave to his teeth.

'But,' Mr Chinley added, 'I don't think I will. You may have the whole day to-morrow. Elizabeth says you look pale.'

'Oh, thanks, father!' said Albert, with plenty of blood in the cheeks Elizabeth thought pale.

'Nothing to thank *me* for,' said father. 'You're old enough to please yourself in such matters. Fact is—— But we'll have some words about that after supper.'

Commonly Mr Chinley's mouth was a grim thing; but for once it seemed to be on the verge of an emotion. Still with the rod in his hand, he looked at his son as if he were no despot, but a man of benevolent ideas tinctured with brooding sadness.

'Aren't you well?' asked Albert, feeling that something ought to be wrong somewhere.

'As well as I ever was in my life,' replied father. 'Here, take this to bits.'

He walked solemnly from the room, and Albert repacked the rod. Albert felt translated into the vestibule of heaven. He was actually *free* to rush to Jenny in the morning. Nor was this all. During the week Elizabeth had twice come to talk politics, and both times he had been permitted to glide away and leave Elizabeth and father to themselves. Nor had father made any fresh reference to his slackness as a wooer, although he was slacker than ever!

Father's communication after supper was still more surprising. He talked like one conscious of his mortality. Because anything might happen to him at any time, it was right that Albert should begin to have an assured position in the world. He was twenty-six, and from the 1st of June was to have two hundred a year.

'I'll keep a hundred of it for your board and lodging while you're with me,' said father; 'but—in the course of things you'll be fending for yourself one of these days. There! And don't ask no questions!'

Albert asked no questions. He understood neither it, nor his father, nor his father's mysterious continued neglect to drag Cousin Elizabeth to the front. He expected to have Cousin Elizabeth held to him like a pistol; it was to be either her and the two hundred a year, or the old footing of just fifty a year for clothes and pocket, with father's

curse into the bargain. But no; the two hundred a year was unconditional, and father was—for him—almost sorrowful about it.

Albert was a happy man that night, even before he began to dream. And he dreamed of Jenny and primroses and kisses, which made him even happier. The primroses she had doomed to so glorious a death were under his pillow, and perhaps they helped his dreaming.

(To be continued.)

IMPRESSIONS OF ALGERIA.

By Captain P. Blair Oliphant.

PART I.

As he looks down from the heights of Mustapha Supérieur upon the town of Algiers there is but little to suggest to the traveller that he is in Africa. The blocks of high stucco-buildings, with their red-tiled roofs and balconied windows, are new and distinctly French in feeling. The well-planned streets, with their double rows of trees on either side and tram-lines along the middle, might be the streets of Marseilles or of any of the towns on the French Riviera. Even the luxurious vegetation which fills the waste places or adorns the well-laid-out spaces does not dispel the illusion; for here are to be seen many of the trees and shrubs which flourish with almost equal splendour on the northern shores of the Mediterranean. Palms and the gray wild-olives, the rich dark-green of orange-trees spotted with golden fruit, and the paler hue of lemons; feathery bamboos and graceful pepper-trees; and clinging to the margins of embankments and cuttings, or where the crumbling rock crops out from the hillside, are gray-green aloes and the forbidding cactus. Here and there the aloes have shot up tall, tree-like seed-stems, with golden trunks and little branches of seed springing from them with almost conventional precision.

On the road below, which winds steadily upwards towards the highest point of the range of hills which fringes the Bay of Algiers, known as Colonne Virol, there are villas and hotels standing in their own gardens, some frankly European in design, others with a half-hearted attempt at Moorish architecture, and just a few real old Moorish houses, flat-roofed and with windows arched and barred. Over porch and trellis the purple bougainvillæa gives a touch of vivid colour against the white walls, and in sheltered spots the date-palm, india-rubber tree, and other tropical plants attain considerable dimensions, though they may never bring their fruit to perfection. But the glory of the flora of Algiers is the eucalyptus, which the French have imported from Australia and planted in groves and by the highways. The eucalyptus has taken kindly to the North African soil and climate, and has enriched the landscape with its gracious symmetry and delicate verdure. In its habit, the eucalyptus is as strange as many other indigenous products of the Antipodes, for it sheds its bark and not its leaves, trailing from stem and branches long sheaths of russet-brown, and leaving the smooth trunk gleaming silver-gray in the dappled shade of its drooping foliage.

The prospect of red roofs and luxuriant vegetation slopes down to the seashore, and ends in the blue waters of the bay and the open sea beyond. Northward is the harbour and mole, where lie the shipping and rows of barges stacked high with coal to replenish the bunkers of ocean-going vessels. On the south-east the bay curves out to sea, fringed by the suburbs of the town, and in the distance by the white walls of scattered villages. Beyond rise the rugged crests of the Atlas Mountains, the barrier between the fertile plains of the Tell and the infinite barren wastes of the Sahara.

Such is the general prospect from the heights of Mustapha, and, with a bright sky above and the genial warmth of the North African spring in the air, nothing could be more alluring. But in the first impressions there is nothing suggestive of the strange continent where one is always finding something new. We must look more closely at the life which stirs on the high-roads and in the densely packed quarters of the old city to discover something of the soul of the land. The main road winding up from the town to the summit of the suburb of Mustapha affords but few glimpses of native life, though it gives an idea of what France has done for the development and adornment of her most cherished colony. Here is the palace of the Governor, a low, domed Moorish structure, almost hidden by the luxuriant vegetation of the surrounding garden. There is a guard at the gate of Chasseurs d'Afrique, resplendent in uniforms of pale blue, with crimson breeches.

The French are justly proud of their regiments of Chasseurs d'Afrique, and of the Zouaves with their semi-barbarous uniforms, for they are both workman-like corps of seasoned men, with all the pride and dash which are the characteristics of their nationality. They have a very different appearance from the ordinary line regiments in France—as great a difference, perhaps, as there is between our home and Indian battalions. On the opposite side of the road is a marble statue of Marshal MacMahon,

at one time Governor-General of the colony. A tram-car, trailing behind it an open wagon packed with a mixed freight of French, Arabs, and foreigners, clatters between the guarded gate of the palace and the statue of the great French soldier, as though to emphasise the fact that military glory is of no avail unless accompanied by commercial progress. But as it whirls out of sight round a bend in the road it does not tell us how far the commercial enterprise which France has lavished upon the town of Algiers has proved remunerative, and we are left to speculate as to whether the expansion of Algerian commerce justifies the enormous expenditure which is being incurred in extending and beautifying the town. The exportation of wine, wheat, and dates must needs be prodigious if it is to pay for the expansion and upkeep of the colony, to say nothing of the garrison of sixty thousand men. But France feels an intense pride in her African possession, and, if she has to pay dearly for it, she reaps her reward in sentiment.

A mixed team of mules and horses, three in the shafts and four strung out tandem-fashion in front, jolts down the road to the jangling of bells and the crack of the driver's whip. Behind them is a cumbrous cart with half-a-dozen great casks of wine upon it. It passes on towards the town, and is followed by a drove of panniered donkeys carrying sand for the new buildings. They are herded along by an Arab with a dirty *burnous* over him and a twisted cord of camel's hair round his head. The donkeys spread themselves over the road, careless of the traffic, and the driver has to push and hustle them aside on the approach of carts or motors. At the corner where the road to the Boulevard Bru forks from the main road there is a group of Arab women and boys. The women, in baggy white trousers, with *haiks* over their heads, are veiled from below the eyes; the boys are lithe, active, and intelligent. They are not at the corner without a purpose. They know that the great white hotels which flank the road are the habitations of visitors and sightseers of many nations, and that small coins are often obtainable from them for the asking, if it is done prettily and with importunity. They will follow a likely-looking tourist for half a mile, sometimes pleading, sometimes demanding, but always persistent. It is said that the best way to be quit of them is to answer their entreaties in German, when they will desist.

Such are the glimpses of life which are to be had on this side of the town of Algiers. There is but little that is characteristic of the Orient, and much to suggest the well-planned French suburb. The natives that we meet with seem foreign to the place; they are but figures set in an incongruous background. The hotels, and the tram-car, and the groups of tourists examining the landmarks, guide-book in hand, are more in keeping with their environment than the Arab and his drove of tiny donkeys, or the veiled white figures which pass silently along the footpaths.

But if we turn our backs on the lovely prospect of the bay and the rugged Atlas Mountains, and, passing through the new French streets of the town, come down upon the Place du Gouvernment, we shall find ourselves on the threshold of another world. Just across the square rise the low, massive white walls of the Djama el Djedid, with its great central dome and square tower. It is a mosque of the Hanefa sect, and it stands like a sentinel at the foot of the ancient Arab city, which rises in a bewildering labyrinth of alleys and vennels, of tiers of blind walls and flat roofs, to the old Kasbah of the Deys, which forms its apex. Very imposing and solid is the Djama el Djedid. The outer walls are devoid of arches or pillars, and the few windows that look out upon the square are small and set high up.

The interior is almost as severely plain as the exterior. There is the inevitable fountain near the entrance, at which the Faithful must cleanse their hands, feet, and faces before they enter upon their devotions. In the centre of the mosque, below the frescoed dome, there is a raised pulpit, and along the walls at intervals are little recesses into which the *marabouts* (or holy men), to whom they are allotted, alone are allowed to enter. There is a second pulpit of carved marble, very beautifully wrought, at the east end of the building. The floor is covered with carpets and matting, and round the pillars—before which the worshippers prostrate themselves in prayer or sleep away the hot hours of the afternoon—there are bands of matting to the height of three feet. There is one very curious feature in the architecture of this mosque—it is built in the form of a cross; and the explanation of this peculiarity throws a light on the medieval history of Algiers. It was built over the site of an old mosque by order of one of the Deys in the seventeenth century. Now, the man whom the Dey employed to build it was a Genoese, one of the many Christian slaves who fell into the hands of the piratical Algerines, and with courage which outran discretion he caused it to be built in the form of the secret symbol of his own faith; for which act of devotion he suffered death by impalement by order of the Dey.

Just across the road from the Djama el Djedid is the old slave-market, where many thousands of captive Christians were exposed for sale as slaves. The story of their capture and enslavement is the history of Algiers for three hundred years, and will be treated more fully in another article.

Close to the Djama el Djedid, in the Rue de la Marine, is another mosque known as the Djama el Kebir. This is the oldest mosque in Algiers, dating from the eleventh century, and the most beautiful. A splendid façade of fourteen arches supported on white marble pillars is a recent

addition, the columns having been removed from a mosque near by, which was pulled down, and re-erected in their present position. The entrance to the mosque is by an arcaded courtyard, where is a very beautiful marble fountain, shaded by orange-trees, at which the worshippers perform their ablutions. The mosque itself is built round the courtyard, and is divided by pillars supporting indented Moorish arches into numerous arcades. The massive doors are of cedar-wood, carved and painted. The floor is covered with carpets and matting; but beyond a few chandeliers hanging from the vaulted ceiling, and the pulpit for the *imam*, the interior is bare.

In the neighbourhood of these two mosques, which stand at the foot of the native city, are several other buildings of historical and picturesque interest. There is the Dey's Palace, now used as the Winter Palace of the Governor-General. Like all old Moorish houses, it is built round a central courtyard, and is very richly embellished with carved marble pillars and old Delft and modern Arab tiles. The doors are of cedar-wood, panelled with oak in tiny square and oblong panels. The dining-hall has a ceiling of carved and painted cedar-wood. Occupying one wing of the upper story is the old harem of the Pasha. The arrangement of this is of interest, as showing the manner in which the somewhat complicated matrimonial affairs of the much-married Mohammedan were managed. The whole wing is divided into two apartments by a wall with an opening in it. The inner apartment was the abode of the ladies; the outer the anteroom, where the eunuch who guarded the sanctity of the harem waited upon the orders of the secluded women. The opening between the two apartments was covered with a heavy curtain, and there is also a little square hole in the partition, covered by an iron grille, through which the guardian could communicate with his charges, and into which he put the lamp when the shades of night fell upon the seclusion of the harem. Hassein Pasha, whose palace it was in the past, seems to have had more than the orthodox four wives allowed by the Koran; for at either end of the women's apartments is a niche, in each of which three of his wives slept; and in the centre is a third niche sacred to the favourite lady. There are marble arches across the room dividing it into three parts, and presumably these were screened by curtains. The outer apartment of the harem is decorated with beautiful old Italian paintings, and the ceilings of both are of cedar carved and painted in rich, dull colours.

Next to the Governor's Palace is the Cathedral of St Philippe, formerly a Mohammedan mosque. It is one of the most conspicuous buildings in Algiers, with its great flight of steps leading up to the arched doorway, and its two high towers on either side. In a side chapel is a marble tomb containing the bones of St Geronimo, who is regarded by the Christian population as the patron saint of Algiers; though an unbending papacy refused to inscribe Geronimo's name in the Roman Calendar of Saints, whether on account of his Arab birth or because his bones refused to perform the miracles necessary for canonisation is not certain. The story of the martyrdom of Geronimo was told by Hædo, Abbé de Fromesta, in his account of Algiers, written in 1612. Geronimo was a native of the country about Oran. As a child he was taken prisoner by the Spaniards and brought up in the Catholic faith. He was subsequently carried off by some Arabs, who took him back to his own people, amongst whom he spent some years as a professed Mohammedan. But he subsequently returned of his own accord to Oran, desiring 'henceforth to live in the faith of the divine Saviour.' The Spanish Vicar-General was delighted at the return of Geronimo, and, to mark his appreciation of the latter's constancy, permitted him to enter the Spanish guard as a paid soldier, and married him to a young Arab slave of his household.

Geronimo seems to have served with distinction, and, under the patronage of his august friend, prospered exceedingly, until, on an unfortunate day in the month of May 1569, he fell into the hands of the Algerine pirates. It was not long before the story of Geronimo's conversion to Christianity became known to his captors, and pressure was brought to bear, by persecution and chains, by promises and threats, to bring him back into the fold of Islam; but to no purpose. Then the Moors laid the case of Geronimo before the Pasha Euldj-Ali, who, with the genius for ferocious cruelty which was the one constant trait of all the Deys of Algiers, devised a punishment to fit the crime of Geronimo's obstinacy. It so happened that a bastion was being constructed for the defence of the gate of Bab-el-Oued, and Euldj-Ali, while inspecting the works, noticed an empty concrete mould lying on the ground. He gave orders that it was not to be filled, as he had a use for it. The next day he sent for Geronimo and asked him whether he would return to the faith of Islam. 'I am a Christian, and a Christian I will die,' replied the martyr. 'As you please,' returned the Pasha, and he showed him the empty concrete mould. 'You shall be buried alive.' So poor Geronimo was put into the mould, the concrete was poured in, the Janissaries stamped on his body, and the block of concrete was built into the walls of the fort Bab-el-Oued.

So accurate was the account given by Hædo of the spot where the block enclosing the body of the martyr was laid that when the fort was pulled down in 1853 the skeleton of Geronimo was found enclosed in a block of concrete, in which the body had left an impression. A plaster cast was taken from the mould in the concrete, which may be seen in the museum at Mustapha Supérieur. The bones of the martyr were collected and removed to the Cathedral.

Looking towards the bay from the Place du

Gouvernment, one sees the famous Peñon and the mole which defied all the Powers of Europe for centuries. The Peñon was built originally by the Spaniards on a small rocky island facing the harbour, about two hundred yards from the shore. From this point of vantage they harassed the Algerines for twenty years. The mole was the work of Kheir-ed-din, brother of Barbarossa, and of successive Pashas and Deys, who gradually connected the small islands which lay off the shore with one another and with the mainland; so that the name of El Djezair ('the Islands'), which has been corrupted into Algiers, is no longer applicable. As specimens of real old Arab architecture, some of the buildings on the mole are exceedingly interesting. The massive gateway, the vaulted ceilings with iron rings at the crowns of the meeting arches from which it was the custom of the Deys to hang their prisoners, the beautiful white marble fountain, the vaults where the prisoners were huddled together, the old pieces of ordnance, no longer threatening the fleets of Europe through the embrasures of the walls, but set up as posts at corners and gateways—these and the very stones beneath our feet conjure up a vision of the bloodiest tyranny that ever disgraced the shores of the Mediterranean, of the most shameful and prolonged humiliation that ever befell the collective Powers of Europe.

There are many other buildings of interest to be seen round about the Place du Gouvernment and the Cathedral of St Philippe; but on the slope of the hill behind them lies the old native city, where we can see Arab life as it exists to-day, and as it has existed for centuries, untouched by French civilisation and the ardent hand of the reformer. A turn from the street of Bab-Azoun, with its modern shops and arcaded façade, and we find ourselves in the heart of the Orient. The narrow valley mounts upwards, by irregular cobbled steps, between the high, blind walls of houses whose upper stories almost meet across the passage, shutting out the sun and the light of day. At intervals, to right and left, are mysterious byways leading beneath vaulted passages to the unknown. But we follow the upward path, passing solid closed doors, studded with brass nails or embellished with exquisite brass-work and knockers, and set in lintels of wrought marble. Here and there a tiny oriel window, barred with iron, projects from the wall, or round beams of undressed timber slanting upwards support the overhanging walls of the upper stories. Presently we find ourselves between rows of little open shops, where the necessaries of Arab life and the simple luxuries of their frugal households can be obtained. Here semolina is sold for *cous-cous*, the staple food of the country; next door is a butcher's shop with uninviting parcels of meat hanging from the ceiling and piled up on the window-ledge; opposite these are vegetables of all descriptions, the vicious-looking red pepper-pod striving to hide itself amongst its withering leaves; then an Arab café, where a dozen loungers are passing the time in desultory conversation or playing a game of draughts over an occasional cup of black coffee.

There is no need for a Licensing Bill in the native city of Algiers, for the inhabitants are all good Mohammedans, to whom the taste of strong waters is, or should be, unknown. Some of the little shops contain cheap and tawdry goods of European origin; in others are sweetmeats and toys for children, or earthenware drums and curious musical instruments of the guitar family (having but two strings and a body formed from the shell of a tortoise over which a skin of parchment is tightly stretched) for the delectation of the elders and those who delight in dancing.

If we turn down one of the mysterious passages which connect one irregular thoroughfare with another, and, passing under the dark and vaulted recesses, emerge at last upon the next upward alley, we find ourselves in a street of open doors, at which unveiled women sit in patient expectancy. It is the street of the Ouled Naïls—of the women who are born to wickedness—who return to their tribe when they have amassed a dowry of shame, to marry and bring forth daughters who will follow in their mothers' footsteps without reproach.

Behind the forbidding walls which border these narrow, sunless streets, the dwellings are constructed on the same principle as the more commodious Moorish villas. The door opens upon a narrow passage, at the end of which is a small open courtyard. The rooms, which are long and narrow, open off the central court; and queer, spiral staircases, which look as though they were hewn from the solid rock, give access to the upper stories. Round the walls of the rooms mattresses are laid on the tiled floor, and there is a low wooden table, a chest of drawers or cupboard of unmistakably cheap European make, and perhaps a tawdry modern mirror on the wall.

At last we emerge into the open at the top of the city, with a feeling that we have passed through a page of the *Arabian Nights*. In front of us the ground slopes up to the Kasbah, the old fort of the Deys, with its grim battlements and embrasures. On the right of the great archway which gives access to the fort is the Pavilion of the Fan—the chamber in which the interview between the French Consul and the Dey Hussein took place, when the tyrant, losing patience with the representative of the French nation, struck him on the cheek with his fan, and thereby precipitated the final overthrow of an iniquitous Government. And even as we gaze upon the historic chamber, a tram-car rattles beneath the ancient gateway as an outward and visible sign of European civilisation and progress.

THE HOUSE OF WHISPERS.*

By WILLIAM LE QUEUX.

CHAPTER XV.—FOLLOWS FLOCKART'S FORTUNES.

ONE evening, a few days later, Gabrielle, seated beside her father at his big writing-table, had concluded reading some reports, and had received those brief, laconic replies which the blind man was in the habit of giving, when she suddenly asked, 'I believe, dad, that you have a quantity of the Glencardine papers, haven't you? If I remember aright, when you bought the castle you made possession of these papers a stipulation.'

'Yes, dear, I did,' was his answer. 'I thought it a shame that the papers of such a historic family should be dispersed at Sotheby's, as they no doubt would have been. So I purchased them.'

'You've never let me see them,' she said. 'As you know, you've taught me so much antiquarian knowledge that I'm becoming an enthusiast like yourself.'

'You can see them, dear, of course,' was his reply. 'They are in that big ebony cabinet at the end of the room yonder—about two hundred charters, letters, and documents, dating from 1314 down to 1695.'

'I'll go through them to-morrow,' she said. 'I suppose they throw a good deal of light upon the history of the Grahams and the actions of the great Lord Glencardine?'

'Yes; but I fear you'll find them very difficult to read,' he remarked. 'Not being able to see them for myself, alas! I had to send them to London to be deciphered.'

'And you still have the translations?'

'Unfortunately, no, dear. Professor Petre at Oxford, who is preparing his great work on Glencardine, begged me to let him see them, and he still has them.'

'Well,' she laughed, 'I must therefore content myself with the originals, eh? Do they throw any further light upon the secret agreement in 1644 between the great Marquess of Glencardine, whose home was here, and King Charles?'

'Really, Gabrielle,' laughed the old antiquary, 'for a girl, your recollection of abstruse historical points is wonderful.'

'Not at all. There was a mystery, I remember, and mysteries always attract me.'

'Well,' he replied after a few moments' hesitation, 'I fear you will not find the solution of that point, or any other really important point, contained in any of the papers. The most interesting records they contain are some relating to Alexander Senescallus (Stewart), the fourth son of Robert II., who was granted in 1379 a Castle of Garth. He was a reprobate, and known as the Wolf of Badenoch. On his father's accession in 1371, he was granted the charters of Badenoch, with the Castle of Lochindorb and of Strathavon; and at a slightly later date he was granted the lands of Tempar, Lassintulach, Tulachcroske, and Gort (Garth). As you know, many traditions regarding him still survive; but one fact contained in yonder papers is always interesting, for it shows that he was confined in the dungeon of the old keep of Glencardine until Robert III. released him. There are also a quantity of interesting facts regarding "Red Neil," or Neil Stewart of Fothergill, who was Laird of Garth, which will some day be of value to future historians of Scotland.'

'Is there anything concerning the mysterious fate of Cardinal Setoun within Glencardine?' asked the girl, unable to curb her curiosity.

'No,' he replied in a manner which was almost snappish. 'That's a mere tradition, my dear—simply a tale invented by the country-folk. It seems to have been imagined in order to associate it with the mysterious Whispers which some superstitious people claim to have heard. No old castle is complete nowadays without its ghost, so we have for our share the Lady of Glencardine and the Whispers,' he laughed.

'But I thought it was a matter of authenticated history that the Cardinal was actually enticed here and disappeared!' exclaimed the girl. 'I should have thought that the Glencardine papers would have referred to it,' she added, recollecting what Walter had told her.

'Well, they don't; so why worry your head, dear, over a mere fable? I have already gone very carefully into all the facts that are proved, and have come to the conclusion that the story of the torture of his Eminence is a fairy-tale, and that the supernatural Whispers have only been heard in imagination.'

She was silent. She recollected that sound of murmuring voices. It was certainly not imagination.

'But you'll let me have the key of the cabinet, won't you, dad?' she asked, glancing across to where stood a beautiful old Florentine cabinet of ebony inlaid with ivory, and reaching almost to the ceiling.

'Certainly, Gabrielle dear,' was the reply of the expressionless man. 'It is upstairs in my room. You shall have it to-morrow.'

And then he lapsed again into silence, reflecting whether it were not best to secure certain parchment records from those drawers before his daughter investigated them. There was a small roll of

* Copyright in the United States of America by the Authors' and Newspapers' Association, New York, 1908.

yellow parchment, tied with modern tape, which he was half-inclined to conceal from her curious gaze. Truth to tell, they constituted a record of the torture and death of Cardinal Setoun much in the same manner as Walter Murie had described to her. If she read that strange chronicle she might, he feared, be impelled to watch and endeavour to hear the fatal Whispers.

Strange though it was, yet those sounds were a subject which caused him daily apprehension. Though he never referred to them save to ridicule every suggestion of their existence, or to attribute the weird noises to the wind, yet never a day passed but he sat calmly reflecting. That one matter which his daughter knew above all others caused him the most serious thought and apprehension—a fear which had become doubly increased since she had referred to the curious and apparently inexplicable phenomenon. He, a refined, educated man of brilliant attainments, scouted the idea of any supernatural agency. To those who had made mention of the Whispers—among them his friend Murie, the Laird of Connachan; Lord Strathavon, from whom he had purchased the estate; and several of the neighbouring landowners—he had always expressed a hope that one day he might be fortunate enough to hear the whispered counsel of the Evil One, and so decide for himself its true cause. He pretended always to treat the affair with humorous incredulity, yet at heart he was sorely troubled.

If his young wife's remarkable friendship with the man Flockart often caused him bitter thoughts, then the mysterious Whispers and the fatality so strangely connected with them were equally a source of constant inquietude.

A few days later Flockart, with clever cunning, seemed to alter his ingenious tactics completely, for suddenly he had commenced to bestir himself in Sir Henry's interests. One morning after breakfast, taking the Baronet by the arm, he led him for a stroll along the drive, down to the lodge-gates, and back, for the purpose, as he explained, of speaking with him in confidence.

At first the blind man was full of curiosity as to the reason of this unusual action, as those deprived of sight usually are.

'I know, Sir Henry,' Flockart said presently, and not without hesitation, 'that certain ill-disposed people have endeavoured to place an entirely wrong construction upon your wife's friendship towards me. For that reason I have decided to leave Glencardine, both for her sake and for yours.'

'But, my dear fellow,' exclaimed the blind man, 'why do you suggest such a thing?'

'Because your wife's enemies have their mouths full of scandalous lies,' he replied. 'I tell you frankly, Sir Henry, that my friendship with her ladyship is a purely platonic one. We were children together at home in Bedford, and ever since our schooldays I have remained her friend.'

'I know that,' remarked the old man quietly. 'My wife told me that when you dined with us on several occasions at Park Street. I have never objected to the friendship existing between you, Flockart; for, though I have never seen you, I have always believed you to be a man of honour.'

'I feel very much gratified at those words, Sir Henry,' he said in a deep, earnest voice, glancing at the gray, dark-spectacled face of the fragile man whose arm he was holding. 'Indeed, I've always hoped that you would repose sufficient confidence in me to know that I am not such a blackguard as to take any advantage of your cruel affliction.'

The blind Baronet sighed. 'Ah, my dear Flockart! all men are not honourable like yourself. There are many ready to take advantage of my lack of eyesight. I have experienced it, alas! in business as well as in my private life.'

The dark-faced man was silent. He was playing an ingenious, if dangerous, game. The Baronet had referred to business—his mysterious business, the secret of which he was now trying his best to solve. 'Yes,' he said at length, 'I suppose the standard of honesty in business is nowadays just about as low as it can possibly be, eh? Well, I've never been in business myself, so I don't know. In the one or two small financial deals in which I've had a share I've usually been "frozen out" in the end.'

'Ah, Flockart,' sighed the Laird of Glencardine, 'you are unfortunately quite correct. The so-called smart business man is the one who robs his neighbour without committing the sin of being found out.'

This remark caused the other a twinge of conscience. Did he intend to convey any hidden meaning? He was full of cunning and cleverness. 'Well,' Flockart exclaimed, 'I'm truly gratified to think that I retain your confidence, Sir Henry. If I have in the past been able to be of any little service to Lady Heyburn, I assure you I am only too delighted. Yet I think that in the face of gossip which some of your neighbours here are trying to spread—gossip started, I very much fear, by Miss Gabrielle—my absence from Glencardine will be of distinct advantage to all concerned. I do not, my dear Sir Henry, desire for one single moment to embarrass you, or to place her ladyship in any false position. I'——

'But, my dear fellow, you've become quite an institution with us!' exclaimed Sir Henry in dismay. 'We should all be lost without you. Why, as you know, you've done me so many kindnesses that I can never sufficiently repay you. I don't forget how, through your advice, I've been able to effect quite a number of economies at Caistor, and how often you assist my wife in various ways in her social duties.'

'My dear Sir Henry,' he laughed, 'you know I'm always ready to serve either of you whenever it lies in my power. Only—well, I feel that I'm in your wife's company far too much, both here

and in Lincolnshire. People are talking. Therefore, I have decided to leave her, and my decision is irrevocable.'

'Let them talk. If I do not object, you surely need not.'

'But for your wife's sake?'

'I know—I know how cruel are people's tongues, Flockart,' remarked the old man.

'Yes; and the gossip was unfortunately started by Gabrielle. It was surely very unwise of her.'

'Ah!' sighed the other, 'it is the old story. Every girl becomes jealous of her step-mother. And she's only a child, after all,' he added apologetically.

'Well, much as I esteem her, and much as I admire her, I feel, Sir Henry, that she had no right to bring discord into your house. I hope you will permit me to say this, with all due deference to the fact that she's your daughter. But I consider her conduct in this matter has been very unfriendly.'

Again the Baronet was silent, and his companion saw that he was reflecting deeply. 'How do you know that the scandal was started by her?' he asked presently, in a low, rather strained voice.

'Young Paterson told me so. It appears that when she was staying with them over at Tullyallan she told his mother all sorts of absurd stories. And Mrs Paterson—who, as you know, is a terrible gossip—told the Reads of Logie and the Redcastles, and in a few days these fictions, with all sorts of embroidery, were spread half over Scotland. Why, my friend Lindsay, the member for Berwick, heard some whispers the other day in the Carlton Club! So, in consequence of that, Sir Henry, I'm resolved, much against my will and inclination, I assure you, to end my friendship with your wife.'

'All this pains me more than I can tell you,' declared the old man. 'The more so, too, that Gabrielle should have allowed her jealousy to lead her to make such false charges.'

'Yes. In order not to pain you, I have hesitated to tell you this for several weeks. But I really thought that you ought at least to know the truth, and who originated the scandal. And so I have ventured to-day to speak openly, and to announce my departure,' said the wily Flockart. He was putting to the test the strength of his position in that household. He had an ulterior motive, one that was ingenious and subtle.

'But you are not really going?' exclaimed the other. 'You told me the other day something about my factor Macdonald, and your suspicions of certain irregularities.'

'My dear Sir Henry, it will be far better for us both if I leave. To remain will only be to lend further colour to these scandalous rumours. I have decided to leave your house.'

'You believe that Macdonald is dishonest, eh?' inquired the afflicted man quickly.

'Yes, I'm certain of it. Remember, Sir Henry, that when one is dealing with a man who is blind it is sometimes a great temptation to be dishonest.'

'I know, I know,' sighed the other deeply. They were at a bend in the drive where the big trees met overhead, forming a leafy tunnel. The ascent was a trifle steep, and the Baronet had paused for a few seconds, leaning heavily upon the arm of his friend.

'Oh, pardon me!' exclaimed Flockart suddenly, releasing his arm. 'Your watch-chain is hanging down. Let me put it right for you.' And for a few seconds he fumbled at the chain, at the same time holding something in the palm of his left hand. 'There, that's right,' he said a few minutes later. 'You caught it somewhere, I expect.'

'On one of the knobs of my writing-table perhaps,' said the other. 'Thanks. I sometimes inadvertently pull it out of my pocket.'

A faint smile of triumph passed across the dark, handsome face of the man, who again took his arm, as at the same time he replaced something in his own jacket-pocket. He had in that instant secured what he wanted.

'You were saying with much truth, my dear Flockart, that in dealing with a man who cannot see there is occasionally a temptation towards dishonesty. Well, this very day I intend to have a long chat with my wife, but before I do so will you promise me one thing?'

'And what is that?' asked the man, not without some apprehension.

'That you will remain here, disregard the gossip that you may have heard, and continue to assist me in my helplessness in making full and searching inquiry into Macdonald's alleged defalcations.'

The man reflected for a few seconds, with knit brows. His quick wits were instantly at work, for he saw with the utmost satisfaction that he had been entirely successful in disarming all suspicion; therefore his next move must be the defeat of that man's devoted defender, Gabrielle, the one person who stood between his own penniless self and fortune.

'I really cannot at this moment make any promise, Sir Henry,' he remarked at last. 'I have decided to go.'

'But defer your decision for the present. There is surely no immediate hurry for your departure! First let me consult my wife,' urged the Baronet, putting out his hand and groping for that of Flockart, which he pressed warmly as proof of his continued regard. 'Let me talk to Winifred. She shall decide whether you go or whether you shall stay.'

(To be continued.)

THE SNARE OF POULTRY-FARMING.

By HORACE W. C. NEWTE, Author of *The Square Mile, The Wife, The Master Beast,* &c.

WHENEVER the follower of a sedentary occupation revolts at the conditions of his employment, his thoughts lightly turn to poultry-farming as an alternative and more congenial means of livelihood. There is, doubtless, every excuse for this delusion, there being many inducements, from specious advertisements in organs of repute to articles in journals devoted to the interests of small farming and poultry-breeding, to urge him upon his disastrous course. All that appears to be required is the capital with which to make a start. Moreover, the amount of ignorance which exists upon the matter has only to be encountered to be believed, ninety-nine people out of every hundred asserting that there is money in the game. On the face of it, nothing could be more seductive. The life is an open-air one and provides plenty of variety, the profits considerable, the risks infinitesimal; also, there is the additional attraction of being one's own master, and thus being able to do one's work in one's own way. But——

It is the writer's purpose to reveal the pitfalls, the ultimate hopeless disaster which awaits any one who is so foolish as to embark his capital in this enterprise, even with some experience in its many ramifications. If this is successful in preventing one person from putting his all in such a venture, these words have not been set down in vain.

Before getting to business, it would be as well to mention the two or three departments of poultry-farming in which there is money, but which are not for the beginner or outsider in the poultry-world, otherwise the undoubted success of these branches will form admirable pegs on which to hang refutations of my contention.

Duck-breeders in the vale of Aylesbury make a good thing out of the successful breeding of great quantities of ducks. They have been at it for years; they have all the ropes of fattening them in the shortest time and of marketing them to the best advantage at their finger-ends. They are greatly assisted by the properties of the grit which is to be found in the district and scarcely anywhere else. So aware are these duck-breeders that they have got a good thing that it is very difficult to get good stock-ducks of the pure Aylesbury strain.

Another exception are the cultivators of the Surrey fowls, so called, which are not indigenous to Surrey. These fowls, which fetch such good prices in the spring of the year, are in reality reared in West Sussex. The poultry-farmers of this district purchase enormous quantities of pullets all over the country, and by a scientific system of cramming by machinery obtain a remarkable plumpness in a short space of time. Poultry-farming in West Sussex is a close corporation, the business going from father to son. There is no doubt that these people make a considerable profit on their outlay. Not so very long ago it would have been possible to say something of the money that was to be obtained from the breeding of geese; but those easily reared birds have been superseded by the more expensive but delicate turkey, so that many poor people who, particularly in Essex, once made a good thing out of that interesting and highly intelligent bird find their occupation gone.

Now for the question of poultry-farming as it confronts the average beginner, who usually has some experience of poultry-keeping. If he has decided to put his money into this industry he will look out for a suitable site on which to begin operations. He will be surprised to find what a number are in the market to select from. In deciding which he will take, common-sense will tell him that the nearer he is to a large town the easier it will be to find a market for his stuff; on the other hand, the proximity to a city will mean a considerable addition to his rent; land, of course, fetching much more an acre nearer a town than farther afield. Also, he may be tempted by the comparative cheapness of a heavy soil to start operations on this, which only means that disaster will overtake him considerably quicker than had he farmed lighter land, clay being inimical to the well-being of poultry.

The farm having been selected, our beginner will probably find that the fixtures and goodwill can be had fairly cheaply from the last poultry-farmer, who supplies any plausible excuse for his giving up the business. Our poultry-farmer, if his tastes are simple, would pay about thirty pounds a year for his house, a pound an acre for poor soil, and anything up to thirty shillings an acre for really suitable land. What he pays for the fixtures and goodwill depends entirely upon his credulity. He would probably not buy up the stock of the last tenant, not from reasons of common-sense, but because he would have—as what poultry-farmers have not?—obstinate views on the subject of the most suitable breeds to keep.

Supposing he decides to back his fancy, he will probably go in for two breeds: one for egg-laying purposes, the other being what is known as a utility fowl—that is, a hen who will sit, lay, and, if killed, will make a fine table-bird. The selection of his breed of laying hens will cause him much anxiety, as purchasers have a preference for brown eggs, while the most prolific egg-producers are the Mediterranean breeds, which always lay white ones.

A further word on the subject of selecting strains. This is nearly always done at the dictates of the fashion prevailing for the moment in poultry

circles, which is apt to change more or less at the bidding of those vendors who naturally have an interest in creating new demands. The excellences of a given breed are proclaimed to the four winds of the poultry-world; the defects are left for the poultry-farmer to discover. Our poultry-farmer will commence with anything from a hundred of each of his two selected breeds, and he will doubtless be puzzled whether to buy a comparatively cheap lot, which may be going, or an expensive number from a reputable and well-known breeder. Here let it be said that the best are cheapest in the end; although they may not lay so well as the barn-door hen—this will be hotly denied—they will fetch more when the inevitable time arrives at which the disgusted poultry-farmer looks about for something better to do.

Having got his stock, our poultry-farmer will then buy incubators and brooders, which will cost him a pretty penny, unless he is able to get them second-hand, when it is essential for him to know what he is buying. The coops and many of the pens he will probably knock up himself; owing to the greatly increased cost of wire-netting in the past two years, this last will run into many pounds.

After he has got his stock and accessories, the most immediate matter is the feeding of the former, when our poultry-farmer will discover the chief reason why his present occupation cannot pay. Owing to free trade (so called), most of our corn-stuff is threshed abroad. In consequence the by-products, such as bran, sharps, and barley-meal, which are some of the most important ingredients in poultry-food, are not available at a price that would make it possible for poultry-farming to pay. However, as our poultry-farmer is now committed, he will get quotations from local corn-merchants, and choose the most suitable. He must also buy vermin-proof bins for his grain and meals, otherwise he will suffer from the depredations of rats, the extent of which has only to be known to be realised. He will also buy a ledger, and having entered his many initial expenses, he will look forward to rapidly filling the credit side of his account.

It is to be presumed that our poultry-farmer is going to do all his work himself—to pay a pound a week for labour is out of the question—so he will find his day fully occupied, perhaps more fully than he bargained for. He will be up betimes, when he will have his stock to feed and water, his breeding-pens to arrange, his fences to repair, and all the thousand and one things which will keep him hard at work till sundown, when he will have his books to make up and his correspondence to attend to. Later there will be the incubators and brooders to look after, when, with fair luck, he will considerably increase his stock.

All this time, beyond the selling of eggs, which scarcely pays, owing to the cost of feeding his stock, he has to live, which means further inroads upon his already attenuated capital. He will soon, however, look for returns, when he will find that there are many unexpected and dismal surprises in store. To begin with, he will discover that if he advertises (at so much an insertion) day-old incubator-hatched chicks at sixpence each, he is only one of many others with like wares to sell, and that a newcomer has an infinitesimal chance of finding a market. He will also find that his carefully and expensively fattened pullets fetch nothing approaching the price he anticipated getting. For spring pullets, which fetch four shillings, and more, in the shops, the utmost he would get from the higgler or shopkeeper with whom he would deal would be two and threepence a head, and then they must be in the best of condition.

Next we come to the question of eggs. It is argued by the inexperienced in such matters that if ten good hens will lay fifty eggs between them a week, a hundred will lay five hundred in the same time. Nothing of the kind. The number of eggs obtained is in inverse ratio to the number of hens kept, and no amount of plausible arguing can alter this axiom of poultry-keeping. Also, as time goes on, the birds will decrease their output, owing to being kept on the same ground. It is here that our poultry-farmer will suffer if he has taken over some one else's poultry-farm. In a comparatively short time illness will attack his pens, and his stock will die from contagious diseases caused by hens picking over contaminated ground. So long, however, as his hens lay, he will naturally desire to obtain the best market for his eggs. Should he be so fortunate as to have a large private connection, he will do well if he can sell his eggs, when these are plentiful, at a shilling a dozen—that is, if his customers are willing to pay the carriage. Otherwise, should he open negotiations with London dealers, he will find that he is handicapped by excessive railway charges and the millions of foreign eggs which are dumped in England at a cheaper rate than he can market his. Besides, as if every factor of the matter were in league to injure him, he will find that when his hens lay well eggs are correspondingly cheap, whereas in winter the birds have to be meat-fed to lay eggs in any appreciable quantity, which not only costs money but is prejudicial to the laying capacity of the hens in the following early spring.

Should our poultry-farmer attempt to sell fertile eggs for setting, he will find himself in competition with countless others, both professional and amateur; these last, by reason of their circumstances, being content with a narrower margin of profit. At all times our poultry-farmer's stock, particularly his chicks, are liable to suffer from the vagaries of the British climate, and to be subject to losses from such cunning vermin as rats, foxes, and stoats.

The wear and strain on the nerves of a constant succession of the inevitable minor losses of poultry-farming have to be experienced to be appreciated. Our poultry-farmer's further pursuit of his calling will depend on the amount of capital at his disposal and his stock of obstinacy. Should neither

of these be exhausted, he will, doubtless, discover that the only way to get rid of the perils attending the contamination of the ground is to plant fruit-trees all over his property — this will cost him a pretty penny—divide it in halves, and use these for poultry in alternate years. Upon the subject of combining fruit and poultry farming I am not qualified to speak; but I can quote the late Mr R. D. Blackmore the novelist, who assured me that no form of fruit-farming could possibly show a profit in the British Islands. He knew what he was talking about; he was an ardent fruit-farmer, and had lost many thousands of pounds in the endeavour to make it pay.

Short of selling his stock and appliances for what they will fetch, and clearing out, our poultry-farmer has two ways of making a living. In the first place, he can become a middleman, when, with the aid of a horse and cart, he can buy from farmers and others and sell at a profit to town dealers. This is altogether a different matter from raising eggs himself. In the second place, he can wax fat by taking in pupils (in more senses than one) at substantial premiums, the while he writes constantly to the papers to tell all and sundry of the money there is in poultry-farming. So much for the ordinary forms of the industry.

He may try his fortune at the breeding and showing of prize birds, when his last state will be worse than the first. If he has plenty of capital at his command, he may go in for large stocks of all the best breeds, trusting to dispose of these at fancy prices to the many amateur breeders in the kingdom. Here he will be handicapped by being in competition with firms that have spent time and money in making their name. Where a few years ago there were a few of these, their number is now legion.

The novice may ask how it is that journals of repute advocate poultry-farming. The reply is that papers exist by reason of their advertisements, and that columns devoted to poultry and kindred interests indirectly puff wares the advertisements of which decorate other parts of the journal.

To any one who is contemplating poultry-farming as a living, I would like to state that every county is dotted with poultry-farms to let; that I have known many men who have lost their all at it, not one who has earned anything like a living. One case in particular I have in my mind. It was that of a friend—he had previously farmed in Canada—who had his own land, made his own coops, henhouses, and the like, did all his own work, had as a customer a big London club which took all the stuff he could send at a good price, and was within easy-sending distance of London. This was his experience: the first two years he made nothing; the third year, thirteen pounds; the fourth, nothing; whereupon he was only too glad to get a job in town.

In conclusion, it is only fair to admit that where poultry are fed on house-scraps anything from a dozen to twenty will well repay for the trouble and outlay. It is also profitable to keep many more about a farm, where there is plenty of waste stuff which can be utilised for poultry-food. But to embark one's all on poultry-farming pure and simple, as things are at present, is nothing more nor less than a tedious means of committing financial suicide.

Since the above was written the writer has met a man who cheerfully loses a hundred and fifty a year at poultry-farming. The work takes all the stuffing out of a shrewish wife.

A BUDGET OF OLD LETTERS FROM EGYPT.

By Dr George Milligan.

AMONGST recent discoveries in Egypt none have awakened a more widespread interest than the countless papyrus documents that have been brought to light. Some of these have been found amidst the ruins of ancient houses and temples; others have formed part of the cartonnage in which crocodile-mummies were enveloped; but far the largest number have come from the rubbish-heaps on the outskirts of the towns and villages, to which they had been consigned as waste-paper instead of being burned, as is so often the case amongst ourselves.

The difficulty of deciphering these frail papyrus-leaves is, of course, very great. Not only has the writing often become blurred and indistinct, but the papers themselves were frequently torn across or partially destroyed before being thrown out; and it has required the unwearied skill and patience of many English and Continental scholars to piece them together, and reproduce them in such a form that their meaning can be understood.

The documents themselves are of the most varied character, the greater bulk being of a more or less official nature—judicial proceedings, wills, contracts, leases, receipts, and so forth. But along with these there have also been recovered many private letters, which — like all true letters — are often of the most self-revealing character, and call up before our minds the whole domestic and social life of Egypt in a manner that before their discovery was wholly impossible.

The best way to show this is to give a few specimens of the letters themselves. And we may begin with a couple of letters which were addressed by his two sons to the architect Cleon, who acted as commissioner of works in the Fayûm district about the middle of the third century before Christ. A large amount of Cleon's correspondence has come down to us, and deals with such business matters as com-

plaints by the quarrymen against their overseer, or the necessity of imposing an additional salt-tax to secure an adequate water-supply. But the two letters that follow are of a more directly personal nature. The letter of the younger brother, Polycrates, may be placed first. It is marvellously complete, without a *lacuna* of any sort, and, according to Dr Mahaffy, who edits it in the collection of *Flinders Petrie Papyri*, is written 'in a beautifully clear and correct hand.' The contents leave a good deal to conjecture; but Polycrates had apparently been borrowing from his elder brother Philonides, and now, perhaps with the view of being enabled to repay him, writes to his father, asking him to interest himself on his behalf with King Ptolemy II., on the occasion of his visit to celebrate the Arsinoe festival:

'Polycrates to his father, greeting. I am glad if you are in good health, and everything else is to your mind. We ourselves are in good health. I have often written to you to come and introduce me, so that I may be relieved from my present studies. And now, if it is possible, and none of your work hinders you, do try and come to the Arsinoe festival. For, if you come, I am sure that I shall easily be introduced to the King. You must know that I have got seventy drachmas from Philonides. Half of this I have kept by me for necessaries, but the rest I have paid as an instalment of interest. This happens because we do not get our money in a lump sum, but in small instalments. Please write to us yourself, that we may know how you are circumstanced, and not be anxious. Take care of yourself that you may keep well, and come to us in good health. Farewell.'

We have no means of knowing what was the result of this appeal; but alongside of the foregoing there may be set a subsequent letter written by Philonides, which exhibits the same characteristics of careful calligraphy. Whatever else Cleon had done for his sons, he had at least given them a good education. Unfortunately, the first part of Philonides's letter is lost; but he also had been making some request about the King, for the first words recovered are: . . . 'for so it will be possible to find the King propitious for the future.' Then he proceeds in a truly filial tone:

'Assuredly, nothing is to me more important than to take care of you for the rest of your life, worthily of you, worthily of myself; and if any mortal chance should befall you, to see that you receive all honour. Indeed, it will be my chief concern to take care of you honourably, both while you live and when you have departed to the gods. Above all things, then, make every effort to be released finally [from your office]. But if you see it is not possible [try] about the time of the falling of the Nile, when there is no risk, and it will be possible for Theodorus to stay behind and act as deputy, to come, in order that for this season you may sojourn with us. But keep this in your mind, that you absolutely must not have any annoyance, but that I shall have thought out everything, that you may be free from trouble. Good-bye.'

For our next letter we may turn to the Serapeum, or great temple of Serapis, at Memphis. Amongst its inmates, as we learn from various documents, were certain persons who had taken up their abode there as 'recluses.' The precise nature of the vows they took upon them is still a matter of discussion amongst scholars; but from the letter before us they were evidently not binding for all time. Isias, at any rate, clearly thinks that her husband has been 'in retreat' long enough, and in a tone of mingled affection and irony writes to urge him to return home. The original letter, which is dated on the 24th July 168 B.C., belongs to the British Museum collection, and has been edited by Dr F. G. Kenyon:

'Isias to Hephæstion her husband, greeting. If you are well, and other things are turning out with you according to your wishes, it would be as I perpetually pray the gods. I myself am in good health, and the child, and all in the house, making mention of you continually. When I received your letter from Horus, in which you explained that you were in retreat in the Serapeum at Memphis, I immediately gave thanks to the gods that you were well. But that you did not return when all who were shut up with you returned distresses me. For, having piloted myself and your child through out of such a crisis, and having come to the last extremity because of the high price of corn, and thinking that now at last on your return I would obtain some relief, you have never even thought of returning, nor spared a look for my helpless state. While you were still at home, I went short altogether, not to mention how long a time has passed since, and such disasters, and you having sent nothing. Then Horus, who took my letter, brought back word about your having been released from your retreat, and I am utterly distressed. Nor is this all; but, since your mother is in great trouble about it, I entreat you for her sake and for ours to return to the city, unless, indeed, something more pressing occupies you. Pray take care of yourself that you may be in good health. Good-bye.'

From the fact that the letter was found in the Serapeum, it would appear that Isias's entreaty was not answered.

With this there may be compared a letter from Oxyrhynchus, so well known through the marvellous discoveries of the Oxford scholars Drs Grenfell and Hunt. It is addressed by a certain Hilarion to Alis, his wife, and throws a lurid light upon the manner in which female child-life was regarded, under certain circumstances at any rate:

'Hilarion to Alis his wife, heartiest greetings, and to my dear Berous and Apollonarion. Know that we are still even now in Alexandria. Do not

worry if, when all the others return, I remain in Alexandria. I beg and beseech of you to take care of the child, and as soon as we shall receive a present I will send it up. If you bear offspring, may there be much happiness! If it is a male, let it be; if it is a female, expose it. You told Aphrodisias, "Do not forget me." How can I forget you? I beg you, therefore, not to worry.'

The care of their little plots of land was naturally a main concern of the Egyptian peasants, and we are not surprised, therefore, to find many letters dealing with agricultural matters. The proper irrigation of the fields, for example, at the time of the Nile's rising was then as now a matter of essential importance, and explains the peremptory tone with which in the following letter a small proprietor summons his dilatory son to return and attend to his work, or else it will be impossible to find a tenant for their lot:

'Hermocrates to Chæras his son, greeting. Above all I pray that you may be in health . . . and I beg you . . . to write regarding your health, and whatever you wish. Already, indeed, I have written you regarding the . . . and you neither answered nor came. And now, if you do not come, I run the risk of losing the lot [of land] which I possess. Our partner has taken no share in the work, for not only was the well not cleaned out, but in addition the water-channel was choked with sand, and the whole land is untilled. No tenant would be willing to take it over, only I continue paying the public taxes without getting back anything in return. There is hardly a single plot that the water will irrigate. Therefore you must come, otherwise there is a risk that the plants are lost. Your sister Helene greets you, and your mother reproaches you because you have never answered her. In addition, security is demanded by the tax-gatherers. . . .'

This letter, which comes from the great Berlin collection, belongs to the first century after Christ; and from much the same period we have an exceedingly interesting bundle of fourteen letters which were found by Drs Grenfell and Hunt in a house at Kasr el Banât, a village in the Fayûm. They are strictly a family budget, and are for the most part addressed by the head of the family, a certain Lucius Bellenus Gemellus, to his son Sabinus or (? his nephew) Epagathus, who seem to have managed his affairs for him. The letters extend over sixteen years, and the latest, written by Gemellus himself when he was seventy-seven years old, bears traces of his advancing age in the 'shaky and illegible' character of the handwriting. The general impression the editors have formed of the character of Gemellus from his letters is that 'of a shrewd old man of business, somewhat wilful and exacting, but of a kind and generous disposition'—qualities which will be readily recognised in the following short extracts. We take them from Drs Grenfell and Hunt's admirable translations of the letters:

'Lucius Bellenus Gemellus to his own Epagathus, greeting. I blame you greatly for the loss of the two pigs owing to the fatigue of the journey, when you had in the village ten animals fit for work. Heraclidas the donkey-driver shifted the blame from himself, saying that you had told him to drive the pigs on foot.'

'Please carry forward the digging of the olive-yards and their ploughing up and hoeing, and plough up and hoe the fallows, and urge the driver to do his proper work every day, and do not unite a number of bulls.'

'Lucius Bellenus Gemellus to his son Sabinus, greeting and continual good health. You must know that Elouras the royal scribe is become deputy for the strategus Erasus, in accordance with a letter of his highness the præfect. If you think it well, send him an artaba of olives and some fish, as we want to make use of him. Send us for the house some . . . and olives, for they have no fresh olives at the house.'

'Send ten cocks from the market for the Saturnalia, and for Gemella's birthday-feast send some delicacies and . . . and an artaba of wheaten bread. Send the animals to carry manure at the vegetable-ground at Psinachis, and the manure-carts, for Pasis is crying out that we must not allow it to be dissolved by the water, and let them fetch his hay. Send the animals at once.'

The mention of the 'birthday-feast' in the last of these extracts recalls to us the love of the inhabitants of Græco-Roman Egypt for entertainments of all kinds, and we can congratulate ourselves on the fact that several formal letters of invitation, inviting guests (who are not directly mentioned by name) to be present at these, have been recovered. From the close resemblance of phraseology in these letters, notwithstanding differences of locality and date, it is obvious that certain formulas for the purpose had become as much stereotyped then as they are amongst ourselves now. Here, for example, is an invitation to dinner in the second century:

'Antonius, son of Ptolemæus, invites you to dine with him at the table of the lord Sarapis in the house of Claudius Sarapion, on the 16th, at 9 o'clock.'

Or take this invitation to a wedding-feast a century later:

'Herais requests your company at dinner in celebration of the marriage of her children at her house to-morrow, the 5th, at 9 o'clock.'

While with these may be compared this somewhat more detailed summons to one Serenia to attend a religious festival about the end of the third or the beginning of the fourth century:

'Greeting, my dear Serenia, from Petesoris. Be sure, dear, to come up on the 20th for the birthday-festival of the god, and let me know whether you

are coming by boat or by donkey, in order that we may send for you accordingly. Take care not to forget. I pray for your continued health.'

These three letters were all found at Oxyrhynchus, and there may be added to them this short letter from Tebtunis, in which a brother invites his sister to come up to 'town' for the New Year:

'Damas, assistant, to Artemidora my wife, greeting. Before all else I make obeisance for you every day. Please come up to the metropolis at the New Year, since I myself also am coming up to the city. Greet your mother and your father. I pray for your health.'

Naturally, letters to or from members of families who had left their homes bulk largely in the particular class of correspondence of which we are speaking; and amongst these there occur a number of soldiers' letters, of which the following is a highly interesting specimen. Its 'situation' has been ingeniously reconstructed by Professor Deissmann in his last work, *Licht vom Osten* ('Light from the East'). According to this, the writer, Apion, son of Epimachus, has been enrolled as a soldier in the Roman army, and along with his comrades takes ship for Misenum. The passage is stormy; but, thanks to the care of his fathers' god Serapis, Apion is saved, and on landing writes to acquaint his father with the fact, and to tell him of the new life that is opening up before him. Already he has received three gold pieces in payment of his travelling expenses, and has got the new Roman name which, according to regular practice, was bestowed on him as a non-Roman on entering the army. With an ardent expression of filial piety and the customary greetings, and the added mention of a little portrait of himself he had taken the opportunity of enclosing, the letter concludes. In full it runs as follows:

'Apion to Epimachus his father and lord, heartiest greetings. Above all I pray that you may be in health, and may always live in love and prosperity with my sister and her daughter and my brother. I thank the lord Serapis that when I was in danger at sea he straightway saved me. When I entered Misenum I received my travelling-money from Cæsar, three gold pieces. And I am having a good time. I beg you, therefore, my lord father, write me first of all a few lines regarding your health; secondly, regarding that of my brother and sister; in the third place, that I may kiss your hand, because you have brought me up well, and on this account I hope to be quickly promoted, if the gods so will. Give many greetings to Capito, and to my brother and sister, and to Serenilla and my friends. I send you a little portrait of myself at the hands of Euctemon. And my [military] name is Antonius Maximus. I pray for your good health.'

Curiously, a second letter of this same soldier has also come to light. It is written several years later, and shows that by this time the writer was married and had a son. From the fact that it is addressed to his sister Sabina, we may perhaps conjecture that the writer's father, Epimachus, was now dead:

'Antonius Maximus to Sabina his sister, heartiest greeting. Above all I pray for your health, for I myself also am in health. When I was making mention of you before the gods of the district, I received a short note from Antoninus our fellow-citizen, and when I learned from it that you were well, I was exceedingly glad. I also do not lose any opportunity of writing you regarding my health and the health of those with me. Greet Maximus much, and my dear Kopres. There greets you my wife Aufidia and Maximus my son, whose birthday-feast is the 30th Epiph according to the Greek calendar. Greet the lord . . . I pray that you may be well.'

It is tempting to go on quoting, but one more example must suffice. And here we may fall back on the famous schoolboy's letter. Its amusing terms—some of which lose a good deal of their force in an English version—have led to its becoming widely known. But as, through the labours of various scholars, the text, as first published in vol. i. of the *Oxyrhynchus Papyri*, has now been amended in several particulars, we may reproduce it in a fresh translation:

'Theon to Theon his father, greeting. You did a fine thing! You have not taken me away along with you to the city! If you do not wish to take me away along with you to Alexandria, I won't write you a letter, or speak to you, or wish you health. But if you did go to Alexandria, I won't take your hand, or greet you again henceforth. If you do not wish to take me away, this will come to pass. And my mother said to Archelaus, "He upsets me. Off with him!" But you did a fine thing! You sent me gifts, great ones . . . ! They deceived us there, on the 12th, when you sailed. Send for me, then, I beseech you. If you do not send, I won't eat, I won't drink. There now!'

Comment is needless.

HER COMING—HER GOING.

If it be winter when she come
I do not feel his breath;
The glow in her dear eyes would warm
The very heart of death.

If it be summer when she go,
Ah me! all fair things pass;
She takes the sapphire from the sky,
The emerald from the grass.

And yet she comes, and yet she goes,
As lightly as a bird;
The calm lake of her maiden soul
By love—or me—ne'er stirred.

SIXTH SERIES.

BY THE BRIMMING LOIRE.

By GEORGE DODDS.

THOUGH the largest of the French rivers, the Loire is yet too variable in its moods to be of much service for navigation. After rains it will sometimes rise to such a height that inundations occur, which the inhabitants of its towns and villages have scarcely learned to control. In spring it stretches, a wind-ruffled waterway like an arm of the sea, between far-separated banks; in summer it will probably be dry. Hence it could not compete with the smaller but more uniform Seine, whose waters washed the lands which early became famous in French history, and where the great French cities were to rise.

But the Loire has a charm of which few rivers in the world can boast. In this respect it might almost be set in competition with the Nile, for its lands in the olden time attracted kings. There they built their magnificent palaces, garnished with everything that the splendid art of the time could yield; and there, free from the affairs of State and personal ambition, they enjoyed in forests abounding in game 'the noble sport of venerie.' It is the will of the French people—ardently republican though they may be—that these châteaux, whether they belong to the nation or to the towns swept by their shadows, be kept in a thorough state of repair, and for purposes of historic interest be easily accessible to the travellers who visit them. In cases where a château is the property of an individual, these matters are perhaps even better attended to.

Automobilism has brought about an immense improvement in French roads during the past ten years or so. Smooth, and also on account of recent rain dustless, they lay straight as an arrow for miles, save in the villages, where they seemed to wriggle up into knots, with a speed-limit sometimes as low as (at Mosnes) four and three-quarter miles per hour. But the motor must be a great source of anxiety to the shepherds and shepherdesses who graze their small mixed herds of sheep, goats, and cattle on the broad grassy roadsides, and to the farmer on his way to and from market, whose unaccustomed horse will prance and snort in terror for a few doubtful seconds as the car goes past.

Coming from Paris, we feel the spell of the Loire with all its power and charm at Orleans. What Orleans suffered during the Revolution, during the invasions of 1815 and 1870, are matters not so near to the imagination as the two famous years 1427 and 1428, when it was invested by the English army. King Charles VII., uncrowned, and afraid of being crowned, was at the fortress of Chinon, eighty miles westward, the remotest and strongest refuge available for him. There, weeping and pitiable—for Agnes Sorel was not yet at Court to inspire him as she afterwards did—this feeble monarch heard of the steadily encroaching tide of English invasion, and felt in his own heart the terror which now lay over France. But the touch of the infinite came in the appearance of Joan of Arc—that touch which scatters armies; and (though it involved almost superhuman labour on her part) not only Orleans but France was free. Orleans remembers, and worthily celebrates her memory every May.

The Maid of Orleans is one of the great assets of the town. She gives her name to one of the main streets. Notre Dame de Recouvrance is a church erected in grateful memory of what she was enabled to do. In one bronze memorial her mailed figure on horseback is represented as giving thanks for her victory; in another, she tramples a wounded Englishman beneath her horse's hoofs, a thing we can hardly imagine her doing save in the rush of battle. Another statue is in the Hôtel de Ville. Sherer's painting of this wonderful girl is in the Musée de Peinture et de Sculpture, and enough relics of her have been found to give her name to another museum. Incidents of her life fill the tapestries and stained-glass windows of churches. The house in which she lived is 37 Rue du Tabour. Could we penetrate the homes of Orleans we should

[*All Rights Reserved.*]

find her picture in many a room, as we find multitudinous reproductions of her in the shop windows and on the ubiquitous picture post-card. Everything is here to keep her history before the mind—illustrated papers and non-illustrated pamphlets. Press and pulpit give themselves to the task, and not in Orleans alone. We heard of a Paris preacher who discoursed on her life for nearly an hour and a half, with frequent and pungent references to '*Les Anglais*.' The Maid of Orleans deserves it all, and it is but small amends to make for the fate which befell her, for that is a dark blot on the history both of France and of England—the France which betrayed her, and the England which raised her cross. One imagines that the annual insistence on these things can hardly be favourable, in Orleans at least, to the *entente cordiale*.

At Orleans we find ourselves on the track of another of the great women of history whose fascination never wanes—Mary Queen of Scots—difficult to compare or contrast with the Maid of Orleans, yet not unlike the Maid in her power of infusing her spirit into others. In 1560 she and her husband, Francis II., had been residing at the Hôtel de Ville in Orleans, then a royal palace, and were just on the eve of departure to Chenonceaux, a beautiful château on (or rather in) the Cher, sixty miles from Orleans, on account of the alarming condition of the king's health. Furniture, tapestries, and pictures were all packed for the removal, and the palace in Orleans was empty; but before a start could be made the king caught a chill while attending service in the chapel of St Croix, and was carried back to the bare room, where a bed was hastily extemporised on the floor. There, in a chamber divested of every sign of royalty and even of comfort, the young King of France ended his short reign and his feeble life, his beautiful, broken-hearted wife at his side to soothe his dying moments; an event this which allayed many fears in Scotland, but which for the young widowed queen was the first of a long series of such singular misfortunes as combine now to render her a figure in history most profoundly to be pitied.

They were on their way to the Château of Chenonceaux when this darkness overshadowed Mary's life. There is much to see between Orleans and this lovely palace of Diana of Poitiers; but we may take them consecutively. For Chenonceaux lays claim to have been the place where Francis II. and Queen Mary spent their honeymoon two years before. This, however, seems to be a mistake, for the scene of the happiest days in Mary's life was the Château of Villers-Cotterets, fifty miles north-east of Paris, on the way to Rheims. Chenonceaux, however, if deprived of this charm for the Scottish imagination, abounds in historic and architectural interest. It is strangely placed in the bed of the river Cher, whose waters have swept beneath its arches and washed its foundations for nearly four hundred years. On the bridge which leads to the mid-stream portion of the building runs a two-storied gallery—the work of Diana, who had received the château from Henri II.; but the whole was greatly altered and embellished by the Queen Catharine de Médicis, who forced Diana to give it up and take Chaumont in exchange. As we see it to-day, still further beautified by successive alterations, it has no more pathetic memory than that which puts it in contrast with that bare chamber at Orleans in which the young King of France closed his eyes for ever on all earthly palaces.

Chaumont is a smaller château on the Loire, fifteen miles nearer Orleans than Chenonceaux, situated loftily on the southern bank. It has thus another kind of picturesqueness of location than that of Chenonceaux in mid-stream, and it commands one of the finest views of the Loire which the country affords. Memorials abound of the days now gone three and a half centuries into the past, when the figure of Diana flitted about its interesting rooms, not infrequently, we may say, with a frown on her fair face as she thought of that imperious queen the strength of whose will she was not able to resist.

After leaving Orleans and passing through villages heavily wreathed in wistaria and budding vines, where the road is now pink and now white with the falling blossom of the chestnuts, our first stop is at Clery, a village which has in its church not only the tomb of Louis XI., but also a famous statue of the Virgin and Child of considerable antiquity. It is claimed for this *morceau de chêne* that in 1670, on a Monday in Pentecost, during part of a service conducted by canons of the church, it seemed to become alive and to change colour, and that at different times, during two and a half hours, tears fell from the eyes of the Virgin and from those of the infant Jesus! In remembrance of this, a procession of pilgrims was instituted, which was observed on each anniversary up till 1793. Then, on account of the Revolution, it fell into abeyance; but when one hundred years had passed, the restoration of that pilgrimage took place in 1893, through the influence of Monseigneur Dupanloup. This is a valuable asset for the church of Clery, whose clergy, like those of the rest of France, are now thrown for their support on the freewill offerings of their people.

Then comes Chambord, situated in a park which is surrounded by a wall nearly twenty miles in length. The park is mostly forest, but the château stands in a large open space, which in olden times was meant to give some chance of dealing with sudden assaults. It is an imposing spectacle as we approach it by one of the park avenues. There are three groups of buildings, separated by two massive towers and flanked by two more, and the steep roofs are crowned with many turrets and lanterns. It is in a perfect state of preservation, and, though never finished, is so large as to contain four hundred and forty rooms, while in its stables is accommodation for one thousand two hundred

horses. When we enter, we find the Salamander—emblem of Francis I.—all over the lofty ceilings. The first striking feature is the double spiral staircase with its open balustrades, of such clever construction that a person at the top could descend without being observed by another coming up. On the landing is a great guard-room, so that the dwellers in Chambord had their home at the heart of an army, as well as girded with stone walls and deep leagues of forest. On this river, which strings these old palaces together in a shining galaxy, we shall not see again anything like Chambord.

That, however, does not mean that the charm of the Loire is exhausted there. Amboise is only thirty miles farther on—Amboise with its massive towers, up whose spirals horses and carriages used to wind their way to the famous terrace where kings have met. There is the low-lintelled doorway of the room—raised, however, since those days—against which Charles VIII. struck his head when hurrying out to his game of tennis, and from the consequences of the blow lost his life. But darker memories lie embedded in the history of Amboise, to recall which gives one a grim glimpse into the kind of influences amidst which the young Queen of Scots lived in France; for one can stand by a window in the older part of the castle, through which she and her Court looked on the massacre of one thousand two hundred Huguenots, who under La Renaudie had plotted to gain possession of her husband, so as to remove him from the baleful influence of his mother, Catharine de Médicis—a sort of preliminary, this shedding of Huguenot blood, to the Massacre of St Bartholomew, for which Catharine again was so largely responsible. What shudderings passed through the heart of the girl-queen as she saw the blood-soaked castle court, and head after head hung out, till there were rows of them dripping blood from the lofty balustrade? Remembering these things, and without pronouncing her capable or incapable of the methods of that mother-in-law who both hated and feared her, must we not admit that the fears which were entertained by John Knox as to Mary's influence in Scotland were, to say the least, exceedingly reasonable? These things were done at Amboise in the shadow of a chapel which to-day, in its restored form, is one of the finest gems of Gothic architecture in existence. Round its walls the carven stone is delicate as pendent lace, and as the evening breeze enters through the open door you expect to see this lace-work flutter at the touch of the moving air. Under the spell of such exquisite art it becomes a trifling incident to find this inscription upon a stone in the floor: '*Sous cette pierre reposent des ossements recueilles dans les fouilles de l'ancienne chapelle royale d'Amboise lesquels on suppose que se trouve la dépouille mortelles de Leonardo di Vinci, né en 1452, mort en 1519.*'

From Amboise the view is so fine and so extensive that Tours shows its cathedral towers twelve miles away. In less than an hour we are in the favourite city of the old Kings of France, and a handsome old town it is. France has no finer Gothic cathedral than that of Tours, so gorgeous in its ornamentation, yet so harmonious, its windows still filled with the 'original magnificent stained glass.' Tours has ever been close to the heart of history, and from the far-off days of St Martin and St Gregory has been much in evidence on account of the great names upon the roll of her citizens or otherwise closely associated with her. Alcuin, by birth a Yorkshire man, and afterwards the friend of Charlemagne, and greatest scholar of the eighth century, during eight years of residence in Tours made its school the most famous in the empire. Balzac, the Sir Walter Scott of French literature, was born there in 1799; and to Touraine we owe Descartes, founder of modern philosophic method (whose life was saved through the mildness of its climate), the mirthful Rabelais, and the solitary idealist but exquisite poet, Alfred de Vigny.

In the environs of Tours many of the most interesting of the ancient French châteaux are situated, and by undulating roads of good surface they are all easily accessible to the cyclist or motorist. The Plessis les Tours of *Quentin Durward* is but a scanty ruin. Azay le Rideau, clasped with streams, and Usse on the hillside, with the overhanging forest, are two of the smaller buildings, almost as perfect as when their first builders took down their scaffolding, scarcely even 'dashed with the stain of time.' These remind us of where Scotland found her models for her baronial buildings as her grim, square keeps were evolving into something more pleasing to the eye. Loches, with its towers and walls, its dungeons, oubliettes, and oratories, was a vast fortress, and has been the dwelling-place of many kings, of whom there is but little trace now, save in the tree planted by Francis I. and the tomb raised by Charles VII. in memory of Agnes Sorel, whose recumbent effigy rests with two lambs at the feet and two cherubs looking down into her eyes. More vivid impressions come to us of the prisoners in the dungeons at Loches, for these have left memorials of their misery carven on the pitiless walls. Particularly interesting are the inscriptions of an imprisoned Duke of Milan and the altar hewn out of the wall by an imprisoned bishop. There are, however, worse dungeons than these, for in the Tour Ronde is a bell-shaped room where hung the iron cages in one of which Cardinal Balue was confined for eleven years. It is said that Balue himself was the inventor of these cages, and that they were of such construction as made it impossible for a man either to lie down or to stand upright. Down the stair that led to this dungeon Louis XI., that 'universal spider,' would come to look at his prisoner and torment him with his gibes. The Cardinal, however, was at length released and loaded with honours by Pope Sixtus IV., being made papal legate to France and Bishop of Albano. Philip de Comines, the historian, who has described this form of imprisonment with some vivid-

ness, underwent it himself here for eight months, having fallen under the suspicion of the Court. 'I have ventured,' he said, 'on the great ocean, and the great waves have devoured me.' Loches, truly, has been the scene of many despairs.

Langeais does a good deal to blot out these horrors from the imagination. It is a masterpiece of fifteenth-century military architecture; but now it lies at the heart of peace, its history still going on, and more beneficently than of old. To wander through its dim rooms, all furnished after the manner of the far-away past, is like wandering through 'the corridors of time.' It is now the property of a rich Parisian family, from whom much kindness is received. They admit the public to visit these rooms, allow the children of the town to play in the court every Thursday, and have fitted up one large room on the top story as a hospital, to which the lady, with a fine Christian generosity, brings down some children from Paris to be nursed, if possible, back to health.

Returning to Paris by Chenonceaux and Blois, through the breaking of the back-axle of the car we have to perform the six miles that lie between us and the nearest railway station in a French farmer's *charrette*—the slowest, most primitive, and most uncomfortable mode of locomotion available in this land of the automobile. Perhaps the worst result of the accident was that the great Château of Blois had to be scamped. Blois by itself is worthy of a visit to France. Over the sloping town the splendid façade of Francis I. looks with its hundred windows, some orielled, others recessed, with pillared balcony beneath, the full length of its long and lofty roof—a pile of exceeding magnificence and beauty. As one approaches nearer and enters the court, the complexity of the carven stonework in balcony, window, and grand staircase fills the spectator with surprise. The exquisite architecture puts out the history for the moment. And yet what comings and goings in this court, what pageant and procession, as armed men rode out to war or chase or tournament, or as the stately funeral passed slowly beneath the gateway! Amongst those myriad rooms there are notable birth-chambers and death-chambers, prisons and oratories; there Louis XII. entered into 'atmospheric existence;' and here Catharine de Médicis, lonely and unlamented, crime-stained but conscienceless, passed to her account. Here the third Duke of Guise, who had become ambitious of the French crown and on that account intolerable to Henri III. (the worst king whom France had yet known), fell, along with his brother the Cardinal de Guise, by the mercenary daggers of the king's assassins, while hireling monks were in the next chamber to the Duke, praying for 'the success of a great scheme.' Though these tragedies and crimes become more vivid when one stands in the rooms and prisons where they befell, yet the main impression Blois gives is in the spell which its marvellous wealth of art casts over the mind. Seated in our hotel in Paris next evening, we agree that never before have we found a holiday more rich in vivid historic suggestion, or more satisfying in visions of beauty, than this by the *castled* Loire.

THE HOUSE OF WHISPERS.

CHAPTER XVI.—SHOWS A GIRL'S BONDAGE.

WALTER MURIE had chosen politics as a profession long ago, even when he was an undergraduate. He had already eaten his dinners in London, and had been called to the Bar as the first step towards a political career. He had a relative in the Foreign Office, while his uncle had held an Under-Secretaryship in the late Government. Therefore he had influence, and hoped by its aid to secure some safe seat. Already he had studied both home and foreign affairs very closely, and had on two occasions written articles in the *Times* upon that most vexed and difficult question, the pacification of Macedonia. He was a very fair speaker, too, and on several occasions he had seconded resolutions and made quite clever speeches at political gatherings in his adopted county, Perthshire. Indeed, politics was his hobby; and, with money at his command and influence in high quarters, there was no reason why he should not within the next few years gain a seat in the House. With Sir Henry Heyburn he often had long and serious chats. The brilliant politician, whose career had so suddenly and tragically been cut short, gave him much good advice, pointing out the special questions he should study in order to become an authority. This is the age of specialising, and in politics it is just as essential to be a specialist as it is in the medical, legal, or any other profession.

In a few days the young man was returning to his dingy chambers in the Temple, to pore again over those mouldy tomes of law; therefore almost daily he ran over to Glencardine to chat with the blind Baronet, and to have quiet walks with the sweet girl who looked so dainty in her fresh white frocks, and whose warm kisses were so soft and caressing.

Surely no pair, even in the bygone days of knight and dame, the days of real romance, were more devoted to each other. With satisfaction he saw that Gabrielle's apparent indifference had now worn off. It had been but the mask of a woman's whim, and as such he treated it.

One afternoon, after tea out on the lawn, they were walking together by the bypath to the lodge

in order to meet Lady Heyburn, who had gone into the village to visit a bedridden old lady. Hand-in-hand they were strolling, for on the morrow he was going south, and would probably be absent for some months.

The girl had allowed herself to remain in her lover's arms in one long kiss of perfect ecstasy. Then, with a sigh of regret, she had held his hand and gone forward again without a word. When Walter had left, the sun of her young life would have set, for after all it was not exactly exciting to be the eyes and ears of a man who was blind. And there was always at her side that man whom she hated, and who, she knew, was her bitterest foe—James Flockart.

Of late her father seemed to have taken him strangely into his confidence. Why she could not tell. A sudden change of front on the Baronet's part was unusual; but as she watched with sinking heart she could not conceal from herself the fact that Flockart now exercised considerable influence over her father—an influence which in some matters was already proved to be greater than her own.

It was of this man Walter spoke. 'I have a regret, dearest—nay, more than a regret, a fear—in leaving you here alone,' he exclaimed in a low, distinct voice, gazing into the blue, fathomless depths of those eyes so very dear to him.

'A fear! Why?' she asked in some surprise, returning his look.

'Because of that man—your mother's friend,' he said. 'Recently I have heard some curious tales concerning him. I really wonder why Sir Henry still retains him as his guest.'

'Why need we speak of him?' she exclaimed quickly, for the subject was distasteful.

'Because I wish you to be forewarned,' he said in a serious voice. 'That man is no fitting companion for you. His past is too well known to a certain circle.'

'His past!' she echoed. 'What have you discovered concerning him?'

Her companion did not answer for a few moments. How could he tell her all that he had heard? His desire was to warn her, yet he could not relate to her the allegations made by certain persons against Flockart.

'Gabrielle,' he said, 'all that I have heard tends to show that his friendship for you and for your father is false; therefore avoid him—beware of him.'

'I—I know,' she faltered, lowering her eyes. 'I've felt that was the case all along, yet I'——

'Yet what?' he asked.

'I mean I want you to promise me one thing, Walter,' she said quickly. 'You love me, do you not?'

'Love you, my own darling! How can you ask such a question? You surely know that I do!'

'Then, if you really love me, you will make me a promise.'

'Of what?'

'Only one thing—one little thing,' she said in a low, earnest voice, looking straight into his eyes. 'If—if that man ever makes an allegation against me, you won't believe him?'

'An allegation! Why, darling, what allegation could such a man ever make against you?'

'He is my enemy,' she remarked simply.

'I know that. But what charge could he bring against you? Why, if even he dared to utter a single word against you, I—I'd wring the ruffian's neck!'

'But if he did, Walter, you wouldn't believe him, would you?'

'Of course I wouldn't.'

'Not—not if the charge he made against me was a terrible one—a—a disgraceful one?' she asked in a strained voice after a brief and painful pause.

'Why, dearest!' he cried, 'what is the matter? You are really not yourself to-day. You seem to be filled with a graver apprehension even than I am. What does it mean? Tell me.'

'It means, Walter, that that man is Lady Heyburn's friend; hence he is my enemy.'

'And what need you fear when you have me as your friend?'

'I do not fear if you will still remain my friend—always—in face of any allegation he makes.'

'I love you, darling. Surely that's sufficient guarantee of my friendship?'

'Yes,' she responded, raising her white, troubled face to his while he bent and kissed her again on the lips. 'I know that I am yours, my own well-beloved; and, as yours, I will not fear.'

'That's right!' he exclaimed, endeavouring to smile. 'Cheer up. I don't like to see you on this last day down-hearted and apprehensive like this.'

'I am not so without cause.'

'Then, what is the cause?' he demanded. 'Surely you can repose confidence in me?'

Again she was silent. Above them the wind stirred the leaves, and through the high bracken a rabbit scuttled at their feet. They were alone, and she stood again locked in her lover's fond embrace.

'You have told me yourself that man Flockart is my enemy,' she said in a low voice.

'But what action of his can you fear? Surely you should be forearmed against any evil he may be plotting. Tell me the truth, and I will go myself to your father and denounce the fellow before his face!'

'Ah, no!' she cried, full of quick apprehension. 'Never think of doing that, Walter!'

'Why? Am I not your friend?'

'Such a course would only bring his wrath down upon my head. He would retaliate quickly, and I alone would suffer.'

'But, my dear Gabrielle,' he exclaimed, 'you really speak in enigmas. Whatever can you fear from a man who is known to be a blackguard—

whom I could now, at this very moment, expose in such a manner that he would never dare to set foot in Perthshire again?'

'Such a course would be most injudicious, I assure you. His ruin would mean—it would mean—my—own!'

'I don't follow you.'

'Ah, because you do not know my secret—you'——

'Your secret!' the young man gasped, staring at her, yet still holding her trembling form in his strong arms. 'Why, what do you mean? What secret?'

'I—I cannot tell you!' she exclaimed in a hard, mechanical voice, looking straight before her.

'But you must,' he protested.

'I—I asked you, Walter, to make me a promise,' she said, her voice broken by emotion—'a promise that, for the sake of the love you bear for me, you will not believe that man, that you will disregard any allegation against me.'

'And I promise, on one condition, darling—that you tell me in confidence what I, as your future husband, have a just right to know—the nature of this secret of yours.'

'Ah, no!' she cried, unable longer to restrain her tears, and burying her pale, beautiful face upon his arm. 'I—I was foolish to have spoken of it,' she sobbed brokenly. 'I ought to have kept it to myself. It is—it's the one thing that I can never reveal to you—to you of all men!'

(To be continued.)

THE ROMANCE OF HIDDEN WEALTH.

By W. A. Atkinson.

FROM time to time we are reminded by the moralist of the assiduous and anxious thought which must be given to the management of large fortunes. No part of this anxiety, save in exceptional conditions, arises out of a fear of the actual loss of bullion, specie, or plate; it originates rather in those subtler risks attending the fluctuations of stocks, the rising and falling of market-prices, and the profitable or unprofitable investment of capital. In ancient times conditions were reversed. The question then was, how to hold the actual specie or plate safely and conveniently, so that one might lay one's hands upon the stock and use it as required. The difficulty now is how to lend it safely and profitably, how to get it out of one's hands, where it lies unproductive, and, by putting it out at interest, live upon the fruits of it. The factors which make for success in the two cases are very different. Strong walls and secret hiding-places give little contentment to the modern millionaire. Public opinion or the varying whims of the markets had little effect upon the affluent squire of the past, whose wealth was locked up as hard cash in an iron-bound chest in the strongest recess of his country house.

From very early times the hoarding of coins has been a common, and indeed a necessary, practice. The frequency with which, in this country, stores of Roman coins are turned up by the ploughshare or laid bare by the pick and shovel of the excavator shows how general the practice of hiding treasure in the ground was with these invaders. Many of these hoards are contained in metal or earthenware jars, and they consist usually of a great number of the small coins which were current at the time when the receptacles were buried in the ground. They were, indeed, working treasuries, and not stores of wealth such as a miser would accumulate. Only a few months ago, for instance, a farmer was ploughing in a field near Stanley, not far from an old Roman road, when the ploughshare struck an earthenware vase lying about two feet in the ground, which upon examination was found to contain over five thousand bronze coins, chiefly of the time of Constantine the Great. About sixteen years ago an almost identical discovery was made at Langwith, near York. In this instance the urn which the ploughshare brought to light held over six thousand brass coins of the reign of Constantine. More valuable, however—to select one more instance—were the contents of a copper chest found near Bingley in 1775 by a farmer who was making a drain. In this receptacle there was close upon a hundredweight of Roman silver pieces, coined at fifteen different periods, the earliest being of the time of Julius Cæsar. It is worthy of remark that this discovery turned the efforts of the local coiners (of whom there was a notorious gang) into a new channel, and they began to counterfeit Roman coins.

The discovery of hoards accumulated and put by in more recent times is not so common an event, by comparison, as we might expect. It was long before post-Roman Britain attained the high civilisation which it had enjoyed in Roman times, and never again was it so completely laid waste as during the Saxon invasions. It was long, therefore, before money again acquired the general utility and importance which it had possessed under the Romans; and when it did so there was no general break in the regular progression of social growth, throwing the country back upon barbarous times and customs in which money had little or no comparative value. Treasure which was laid by in the times of the Lancastrian kings might be discovered in the reign of Elizabeth, and it had at once a recognised value as bullion, if not as current coin. And, again, the habitable sites and

dwellings where treasure was likely to be hidden by accident or design were in most instances continuously occupied from Saxon times, and there was thus greater probability that the hidden stores would be brought to light than was the case in the generally deserted and forgotten sites of Roman times.

Still, the discovery of medieval hoards is not of uncommon occurrence. In July 1902 an exceptional discovery of this kind was made at Colchester by the workmen who were engaged in taking down the premises of the London and County Banking Company, which were about to be rebuilt. Six feet below the surface of the ground they found a leaden casket which contained nearly twenty thousand silver coins of an early period, many of them of the reigns of Stephen, John, and Henry II. They were all in good condition, which, considering the perishable nature of silver, affords excellent testimony to the protective character of the leaden receptacle in which they were buried. At Oulton, near Leeds, a small discovery of a somewhat similar kind was made in 1905, and was the subject of an official inquest. Some men who were engaged in digging a hole to receive the carcass of a horse struck a metal vessel, which proved to be an urn of peculiar shape. Within the urn were discovered about two hundred silver coins dating from the sixteenth century.

The hiding or hoarding of treasure is a subject often referred to in our literature, and it has occasionally employed the pen and the brush of the illuminator of manuscripts. An illumination of a fourteenth century manuscript at Oxford depicts a couple of men lowering a metal-bound box into a bricked vault by means of a couple of cords. Several persons are looking on, and one of them is a priest holding a book and sprinkling holy water over the box. The inference would seem to be that the treasure was being consecrated to religious use; but whether that be so or not, the means employed for its due preservation are significant of somewhat lawless and uncertain times.

There is evidence that the hiding of money in secret places in the ground was a well-known practice some three hundred years earlier than this. Stigand, the Saxon Archbishop of Canterbury, thus disposed of his treasures; and it is said that he spent the closing years of his life as a veritable miser at Winchester, having about his neck the cord of a little key which fitted a box wherein he kept a list of his money-bags buried in secret places.

The curious legend of 'The Thief of the Treasury,' translated by Dr Luard in the *Life of Edward the Confessor*, in the Rolls Series, affords indirect evidence that in those early times the central national treasury was nothing more nor less than a hoard of gold stored in the royal bedroom of the palace at Westminster. While the king lies in his bed, the chamberlain, Hugo, enters the room, and takes such money from the treasure-chest as he wants. A scullion of the kitchen, entering a little later, finds the chest open, and, thinking the king asleep, helps himself to a portion of its contents. Having hidden this stolen treasure, he returns again and yet again for more. But at the third time the steps of Hugo are heard approaching the chamber, and the king good-humouredly advises the scullion to fly quickly, lest he be discovered by the chamberlain, who will not leave him even a halfpenny.

Numerous treasure-chests of various periods survive to remind us how universal was the custom of securing wealth within the walls of houses. The iron-bound so-called Domesday Chest, with its three massive locks, is one of these. Its woodwork is two inches thick, and sheeted with iron both within and without, in addition to the iron bands and iron nails. Its weight is at least a quarter of a ton. Down to the seventeenth century or later these iron-bound boxes were in use, and some of the more recent ones have locks of most elaborate construction, occupying the whole of the inside of the lid, and shooting a dozen bolts in all directions, even in some cases into the corners of the box.

A manuscript of the fifteenth century contains an illumination in which Avarice is represented as an English trader counting his money. His metal-bound treasure-chest, not in this instance a large one, stands upon the table, and its open lid reveals a store of coins filling the box to its edges, and suggesting a hoard of several hundreds, if not even a few thousands, of pounds—a substantial sum in those times.

Merry Mr Pepys, who laid his soul bare in his secret diary, was not without a touch of avarice. Listen to this confession: 'This day I received four hundred and fifty pieces of gold more of Mr Stokes, but cost me twenty-two and a half pence change; but I am well contented with it, I having now nearly two thousand eight hundred pounds in gold, and will not rest till I get full three thousand. . . . My wife and all the maids abed but Jane, whom I put confidence in; she and I, and my brother, and Tom and W. Hewer, did bring up all the remainder of my money and my plate-chest out of the cellar, and placed the money in my study with the rest, and the plate in my dressing-room; but, indeed, I am in great pain to think how to dispose of my money, it being wholly unsafe to keep it all in coin in one place.' A very sagacious conclusion, and one which many others must have arrived at in those times—such, for instance, as the father of the poet Pope, who, when he retired from business in the City, carried with him into the country a strong chest containing nearly twenty thousand pounds, from which he drew the sums for his household expenses as he required them.

The times were now ripe for the institution of banks of a modern character, and they originated shortly after the Restoration. Informal banking

had formed a branch of the goldsmith's business for a long time before this; but the action of Charles I. in seizing some two hundred thousand pounds placed by the merchants of London in the Royal Mint for safety, and the general disturbances caused by the Civil War, must have forced many to fall back upon their own resources for the preservation of their wealth. What, under the circumstances, could be safer or more convenient than a private hoard lodged in some secret place in one's own house?

Sir Henry Slingsby, when quartered at Newark with the king in 1645, grew short of money. He accordingly made a secret journey to his home near York, making the actual entry into his house by night, where he stayed one day, and returned with forty pounds in gold, the visit being made so secretly that scarce any in his own house knew that he was there. A secret hiding-place was indispensable for these private hoards at this particular time. Two rival factions were roving over the country, neither of them disposed to be too nice about sacrificing the private wealth of their opponents to the public uses favoured by themselves.

It was the common opinion of writers on economics in the seventeenth century that much currency was hidden in ceilings, behind wainscots, and in secret drawers. Hogarth, in his print of 'The Inheritance,' forming one of the set of 'The Rake's Progress,' has depicted a shower of coins falling from the ceiling of the room where a workman has accidentally disturbed the moulding. Old cabinets and secretaires of any size have usually one or two secret drawers or cupboards often most ingeniously contrived. It is surprising how well these secret corners elude detection, even when their existence may be expected or inferred. Some years ago the wife of a Kentish labourer was breaking up an old chest of drawers, when she discovered a secret compartment nearly filled with gold coins of the reigns of William III. and George II. The chest had been purchased for a few shillings about twenty years previously, and the fact that this little store of coins had not been discovered earlier was all the more strange because in all probability the drawers had been several times repaired.

A curious list of hiding-places for money is afforded by two old books of memoranda and receipts relating to the Fulham Pottery Works in 1693 and 1698. There are two hundred and forty guineas in a wooden box in a hole under the fireplace in the garret. There are four hundred and sixty more in two covered receptacles under the fireplace in the old laboratory. Behind the door of the little parlour there is a can containing some milled money. Two boxes full of money were placed in two holes of the great furnace, from which they were to be drawn by a long, crooked iron standing behind the kitchen door. In all, ten or a dozen such hiding-places are named, and the money was variously contained in boxes, bags, cans, pots, and purses.

There can be little doubt that the practice of hoarding money and valuables in private houses gave great encouragement to crime. A glance through the pages of early volumes of the *Annual Register*, largely devoted to the chronicles of crime, reveals a number of apparently hastily planned robberies, which resulted in rich hauls out of all proportion to the occasion. Some thieves get in at the garret-window of a house in Devonshire Square, and carry off from the owner's bedchamber an iron chest containing cash, notes, and other valuables to the amount of ten thousand pounds. Two men enter the Custom-House at Limerick, and in a few minutes carry off cash to the amount of about eighteen hundred pounds. Such is the character of the crimes which were then most successful—a bold, quick bid for the treasure-chest, which was almost certain to be well-stocked, and very often convenient for removal by two or three thieves acting in concert.

IN THE PRIMROSE-TIME.

CHAPTER III.

FATHER went to the foundry with his usual regularity at a quarter to nine, and Albert caught the nine-eighteen train into Worcestershire. His luggage consisted of the rod, a handbag, and a host of hopes.

It was significant that Jenny's other name, Hollowbone, had not jarred upon him during the week. In truth, he almost forgot she had another name. That remarkable—indeed ugly—second name belonged to her father; as touching Jenny, it was only a temporary accident of birth. He could think of her as Jenny, or Jenny Chinley, but not as Jenny Hollowbone.

At half-past ten he reached the cottage, but at twenty-five minutes to eleven he was staring at Jenny herself in leaden-eyed confusion.

'My darter, Mrs Possett,' said Mr Hollowbone when Albert was in the stiff little parlour, and she had come from another part of the house to his call. —'And this is the gentleman, Jenny.'

It was Jenny, sure enough; yet not his Jenny. She was beautiful, but cold as ice; and she treated him like a stranger.

'How do you do, Mr Chinley?' she inquired with a composure worthy of Elizabeth herself. 'I hope we shall make you comfortable.'

Her fingers were as cold as her eyes, and she wore

a wedding-ring. His ears had *not* deceived him; she was a 'Mrs.' He let her hand fall as if it were something disagreeable.

'We didn't expect you so soon,' she went on, with some light fidgeting of the eyebrows.

'Well, Jenny,' said the old man, 'that's no fault o' mine. He said the afternoon.—Didn't you, now?'

Albert admitted it. 'It's—all right,' he murmured. 'That is'—— She was certainly Jenny, though with that appalling ring on her finger, and without the laughing radiance of the other day. Eyes, mouth, ears, and hair were the same, and—— 'I sha'n't want anything to eat, thank you, until the evening. I'll get something, somewhere. I'll go out fishing.'

'There's no fish in the brook, Mr Chinley,' said Mr Hollowbone; 'but never you mind. You're young, and there's allers plenty for the young to do.—I'll go and feed the pigs, Jenny. You and the young gentleman won't need me.'

There was a work-basket on the table, and a black stocking with a needle in it. As Mr Hollowbone departed Jenny gathered the stocking and basket together.

'I didn't know you were married,' Albert then blurted out, as if he were aggrieved.

'Didn't you?' said she, and her eyes added plainly, 'What is that to do with you?'

'Does he live here?' asked Albert, with staring eyes.

'Does who live here?'

'Mr—Possett!'

'My husband is dead,' she said.

'Dead!' cried Albert.

One side of Mr Hollowbone's white whiskers then reappeared, and he told Albert that his bedroom was at the top of the stairs, to the left. 'Some folks like to wash their hands,' he explained jocosely.

Bewildered by his disappointment, Albert could scarcely speak. 'I'll take a stroll round,' he stammered.

Jenny was smiling for the first time that day, and it brought back a little of her earlier charm. A very little. The dimple was not present. Apparently hers was a chin-dimple that came and went. There was not another trace of it yet.

'Yes,' she said, 'give us a few minutes, please. The room will be much cosier when the fire is lit. And if a chop and some bread and cheese will do for your dinner'——

'Yes, thank you, Mrs Possett,' said Albert.

Both words came hard to him, especially the 'Mrs.' But he felt rather better already. She could never again be to him the angel who had picked primroses and slept with her lips just parted in a smile; but it was perhaps something that Mr Possett was dead. And yet no; ere he was in the road he knew that she was nothing to him; it was a bubble pricked.

What a fool he had been! And what enigmas women were! To pretend not to recognise him, and to keep it up even when they were alone!

He crossed the road to the bridge, leaned upon the parapet, and burned with unreasonable shame. Supposing he had kissed her a week ago! It was a volcanic idea. He went off with long strides down the water-side lane, his fingers clenched in his pockets.

What would have happened if he *had* kissed her—a married woman—and a widow—and she had awakened? And the odds were that she would have awakened.

He walked a mile or more with bent head and agitations of the most contrary kinds. He did not hear the music of the stream, nor heed the profuse spangling of primrose gold in the green and crimson of the wood. He wished himself back in town. The week-end that was to have been a rapture had become an ordeal. The Jenny he had worshipped was a deceiver, and he—very much what Cousin Elizabeth had always, and notably of late, implied that he was.

The road descended with the stream, and at length turned at right angles where the gables and chimneys of a house appeared among the trees on the right, with a rosy apple-orchard backing to the stream, and a smooth lawn in front.

Albert glared gloomily at the house. He didn't want yet to see anything that reminded him of men and women; but there it was, unavoidable.

A bath-chair was on the lawn, containing an old man in a shawl and—incongruous spectacle—a top-hat. By him sat a girl, with some embroidery, bare-headed.

Albert stood still and looked behind, in staggering perplexity. It was Jenny—Mrs Possett! She had changed her frock, from brown to sea-blue, and done her hair differently. This was his first belief, before he had had time to recognise its absurdity.

And then the girl glanced up from her work, and the sweet face of those other Saturdays proclaimed itself. She rose and approached him, with an expression in her eyes which, in particular, made Albert long to rush at her and clasp her to him. 'I thought it was you,' she said, with delicious calmness; and there stood the chin dimple which he had missed in Jenny. 'I didn't tell them. I kept it as a secret. How do you do, Mr Chinley? You see, I've got your name quite pat.' She opened the gate and gave him her hand.

Albert gasped like an expiring fish. 'Oh!' he said, 'I *am* glad.'

'Are you?' said she, with still more of that particular expression in her eyes.

'I'm glad you're not Jenny. You can't be,' he said. 'But how alike you are, only you're younger!'

'I'm not younger,' she laughed. 'We're the same age to an hour, and always have been ridiculously alike. But Jenny married when she was seventeen, and I've had more sense, that's all. Didn't you know I was here?'

'My word! no,' said Albert heartily. 'If I'd known I shouldn't have been so wretched. I'—— He lowered his voice and peered at the bath-chair.

'It's only Uncle Progress,' she said. 'Come and be introduced. Poor old dear! he had a stroke last year, and I'm taking care of him. He's very deaf; but he knows about you, though the others don't. What fun it is, seeing you again! He kept sheep in New Zealand for years and years, and I'm his little lamb. That's what he says.'

She tripped ahead, and, putting her arms round the pathetic figure in the chair, related her news.

'This is Mr Chinley, dear. You remember? I gave him the primroses, and when I was asleep last Saturday—— Oh!' She peeped round, and her pursed lips and merry eyes told Albert something. —'Well, I don't care. I knew you wouldn't do it. I was so frightened, though; you came so near. It was all I could do to keep from shrieking. But I liked you all the better when you didn't.'

Then, for many minutes, Albert behaved like a man in dreamland.

The old gentleman in the bath-chair had weak blue eyes. His words came disjointedly; but Albert answered his questions with extreme accuracy, Betty aiding him. She was Betty, not Jenny.

His ailments notwithstanding, Uncle Progress had plenty of wits. His inquiries were as practical as Albert's own father. He ascertained about the brassfoundry in Wazeley Street, and about Albert's small family circle. Betty made brief comments on the results of this deliberate cross-examination.

'Oh, how nice!' she said, for example, when Albert avowed his standing in the world; and she proclaimed it to her uncle. 'His father gives him two hundred a year, dear. Isn't that splendid?'

'Trade is a good thing. It's the best kind of work,' muttered Uncle Progress. 'Better than sheep-farming.' His last question before he yawned was this, 'What brings you down here?'

But Albert was saved from that test. The yawn seemed to touch a spring in Betty.

'You've talked *quite* enough!' she cried. 'You are not to speak another word, dear, until I say you may. I'm taking you in now.'

Albert pushed the chair to the house. '*Do* let me!' he begged, wide awake again; and Betty accompanied him, with smiles and praise of his carefulness.

'He'll go to sleep now,' she told him; 'and I'll walk back with you to father's.'

But the old gentleman was not so obedient. He spoke once more, in spite of other yawns.

'I like his looks. Give him a glass of wine,' he said; and only when Albert had drunk this, with the grave hope that Uncle Progress would soon be better, did the old gentleman close his eyes.

The walk back to Gorry Bridge made the fourth deep mark upon Albert's heart. First the primroses; then the temptation in the wood, and its sequel of desires; next the discovery that she was Betty and not Jenny; and lastly this.

She was all sweet transparency now. She asked him his age, and told him that she and Jenny were twenty-two. Every one said she was a child for her age; but she couldn't help it, even if it were true—and she thought it wasn't. Uncle Progress was so fond of her because she was lively, and because troubles ran off her like rain off a house.

And Albert told her things. He began with his shock about Jenny, and that made her laugh until she seemed to cry. He confessed openly about the temptation of a week ago; and he told her finally, when the cottage was before them, that she, and she only, had brought him to Gorry Bridge for the week-end. 'There!' he said, as brave as a Palladin; 'now you know!'

She bore the blow well. 'It's most interesting,' she said, with pretty blue-gray lightnings in her eyes; 'but I—happened to guess it.'

And then she changed her mind. She wouldn't come in with him. She would run back to Lane End. But he was to be sure and make friends with Jenny—'poor old Jenny,' whose husband had shot himself pulling his gun through a hedge a year ago last March.

'You see,' she said, 'being twins, if *she* doesn't like you, I'm afraid I sha'n't.'

'When shall I see you again?' he asked hungrily.

'Oh, I don't know,' she said, with an airy shrug; 'but I shall go into the wood soon after dinner. It's my playground when the flowers are out.'

'I'll be there,' said Albert. 'And—you know why, Betty?'

'I can't *think* why,' she replied, 'and perhaps I sha'n't go after all. Good-bye.'

There could be no lovelier smile on any face in any land of earth than the smile with which she parted from him. So thought Albert as, with the firm tread of a man and a high head, he returned to Jenny and Mr Hollowbone.

CHAPTER IV.

AT two o'clock Albert made for the wood, after winning astonishingly upon Jenny's esteem. He praised everything she set before him, from the willow-pattern plates to the cheese.

'Why,' said Jenny, 'I never saw such a change in any one. It only shows what a few minutes' good country air can do. We didn't know what to make of you at first, Mr Chinley; but I think I shall like you now.'

'I mean you to,' said Albert earnestly, 'in a way.'

He climbed into the wood near Lane End at about a quarter past two, and eyed Uncle Progress's house until a quarter to three. Only then did Betty come forth, whistling softly, and down he plunged to join her.

'We'll go where I went to sleep last week,' she said, when he wished to help her to climb immediately.

And there it was, among the primroses once more, that Albert told her of his love and longing.

They sat side by side, and she listened and smiled, and—at length—put her hand into his. And then, just as they were, without another word spoken, he flung his arms around her and kissed her, wide awake.

This was the real beginning of his week-end.

On Sunday Jenny and Mr Hollowbone were informed, and Jenny's 'Well, I declare!' paired with Mr Hollowbone's 'I never heard anythin' so sudden in all my days!'

But it was bad news to neither of them, for, in accordance with Betty's instructions, Albert had on Saturday evening told Jenny as much about himself as Uncle Progress had already drawn from him. Jenny had liked this amiable trait in him, though wondering. Now she understood.

Albert marched away to Lane End after this confession, and there he dined.

Uncle Progress also knew, and was kind about it. But he hoped, feebly, poor old man, with watery eyes, that there would be no marrying in haste. 'She'll have most of what I leave, young man. I tell you so that you may tell your father. But don't be in a hurry.'

Albert promised anything and everything. It was enough for him at present that Betty loved him.

And then they returned to the primroses. They were there when the sun shone high, and there when it set; and they were there once more early on the Monday.

When it was time for Albert to run for the train, Betty ran a quarter of a mile with him. He wouldn't let her run more than that; but he kissed her under an oak-tree, and reminded her for the fifth or sixth time that in four days there would be another Saturday.

'I wish an earthquake would swallow the four days,' Betty said yearningly.

He hugged her once more, wished the same, and hastened on. The road was a winding one, and he was soon lost to sight.

. . . . . .

At eleven o'clock he entered the foundry office, and didn't care what happened to him. If father swore—as he sometimes did—he would bear it patiently. He would then explain to father that if Elizabeth had a million a year he wouldn't marry her; whereas he would joyfully beg in the streets with Betty by his side. This to show father what true love was.

Father met him with a heavy countenance and bloodshot eyes, but language scarcely in keeping.

'Good-morning, my boy,' said father. 'Y—you're late. Never mind.—And just go into the yard somewhere, Evans, and you too.'

Evans was the salaried clerk, and the 'you too' a new office-boy. They went almost like pellets from a gun.

'Anything the matter?' asked Albert.

'Shut the door. I want to get it off my chest,' said father, more bloodshot still. 'Sit on that stool.'

Father folded his arms and paced. It was a small office. His pacing was like a caged lion's.

But for Betty, Albert would certainly have felt alarm. Had the business come suddenly to smash? Or had father really an incurable disease which he meant to announce with characteristic directness?

Albert sat on the office-boy's stool and waited for the storm to break.

And then father stopped pacing, and dropped his hand on Albert's shoulder like a blacksmith's hammer on an anvil. 'My boy,' he said thickly, 'she's too old for you, and I—I'm going to wed her myself. Call me whatever you like. It's the first time I've undersold a market since I started in business. I fought ag'in' it for months; reckoned you and she'd hit it off, give you time; but nature's done the job. There's more sense in that woman's little fingers than in the brains of most. And see here, Albert, she said straight she always looked on you as a babby, and always would. That did it; that and nature. "How about the babby's father, Elizabeth?" I axed her, carried away, and she gave me her hand in a moment. What do you think of me, my son?'

Albert kept his countenance like an actor. 'When did all this take place?' he asked, with a stiff neck.

'Saturday, at tea-time, my boy,' replied father huskily.

'Muffins?' suggested Albert, like a cross-examining lawyer.

But the expression in father's eyes cried to the heart-strings even of his son.

'You're mocking me, my boy,' said father, still a penitent and unshriven.

'No, I'm blessed if I am,' exclaimed Albert, all elation and forgiveness now. He stood up from the stool, and put *his* hands on *father's* shoulders. 'It's my turn now, sir,' he said.

. . . . . .

He made a longer story of Betty than father of Elizabeth. Father inserted ejaculations, but they had no effect on him. Only when he was nearly through, and he mentioned, in parenthesis, that Betty would inherit five or six thousand pounds when Uncle Progress went to heaven—only then did father's tongue burst loose and prevail.

'By gum, lad,' he declared, 'but you're smart! I'd never have thought it of you—never; not if I'd lived to a hundred. Five thousand pounds! See here. I tell you what. Take your hat and ask the architect to step round. We'll have plans out for enlargement of premises this week. And when you've done that, go and tell her all about it.'

'Her!' exclaimed Albert, with pricking ears.

'Your cousin Elizabeth, my boy.'

'O—h!' said Albert. 'All right, if I must. I thought you meant Betty. It seems years since I said "Good-bye" to her.'

Father broke into a bluff but gratifying laugh. 'You young dog!' he said. 'Well, get along with you. You can take the rest of the day off, and run down and say "Good-bye" to her again.'

Albert rushed at his hat.

THE END.

CHARON'S FEE.

By G. L. Apperson, I.S.O.

THERE has recently been arranged in one of the large rooms of the British Museum an extremely interesting exhibition of objects relating to and illustrative of the daily life of the ancient Greeks and Romans. The exhibits illustrate that life in both its public and its domestic aspects. Here the visitor may see dolls and furnishings for dolls' houses; children's toys of all kinds; the circular discs once believed to have been used as vouchers for theatre or amphitheatre seats, but now regarded as counters for games; specimens of the stylus; waxed wooden tablets for writing; dice; knucklebones or 'dibs' of various materials; pigments; specimens of various kinds of footgear and wearing apparel; articles of ancient furniture; pumps; weights and measures; and a hundred other things illustrating the daily life of old.

There is a special series exemplifying ancient burial customs; and one of the most striking of the objects in this section is a finely formed Athenian urn containing calcined bones, among which can be seen, actually yet sticking to the jawbone, the obolus which was placed in the dead man's mouth to serve as Charon's fee for ferrying him across the Styx. This is an extraordinarily vivid illustration of the way in which archæological discovery bridges the ages, and brings the modern inquirer or student, or even the most casual onlooker, into close contact with—into the immediate presence, as it were, of—a concrete instance of ancient belief and ritual.

The obolus, originally of silver and later of bronze, was worth about three-halfpence of our money, and was certainly not an extravagant fee for crossing the Stygian stream. The coin was not always placed in the mouth of the dead. Sometimes it was placed in the hand, and in other cases in a kind of purse which was deposited beside the body. A more curious mode of disposal of the fee for the ferryman was revealed many years ago when a Gallo-Roman cemetery dating from the days of the later Roman Empire was discovered near Vernon, in the department of Eure, France. Twenty-two skeletons were unearthed, each with an earthenware vase under the right arm and in one of the eye-sockets a bronze coin. Coins are often found in ancient burial-places without anything to indicate the manner in which they were originally disposed; but in many cases there can be but little doubt that they represent Charon's fee.

Sir Thomas Browne, in his noble *Urn Burial*, describing ancient customs, says: 'That they buried a piece of money with them as a fee of the Elysian ferryman was a practice full of folly.' From a common-sense point of view this may be true; but it is remarkable how deep a hold this particular 'folly' had upon the popular mind. It lasted for long centuries after paganism had given way to Christianity. Like many other pagan customs and observances, it continued in a slightly changed form under a thin veneer of Christian nomenclature. John Aubrey, the seventeenth-century antiquary, tells us that when he was a boy, 'before ye Civil Warres, I heard 'em tell that in ye old time they used to putt a Penny in dead persons' mouths to give to St Peter; and I thinke that they did doe so in Wales and in the north country.' It was a quaint idea to substitute St Peter, the keeper of the gate, for Charon, the ferryman of the Styx; but the quotation, like many other references and allusions in Aubrey's writings, shows how deep was the cleavage between things new and old that was made in England by the great Civil War. It is doubtful whether this provision of a fee for St Peter survived that troubled period in any part of England.

In rural France the custom of putting a coin in the hand of the dead survived until quite recently, and perhaps still exists in the more out-of-the-way parts of the country. Hamerton, in his *Round My House*, which was written a little more than thirty years ago, says that the peasants of Burgundy maintained the old classical custom simply from force of habit. 'They have forgotten Charon,' he wrote, 'and cannot tell you why they put the coin into the dead hand; but they would not omit the ceremony. A much more touching practice is that of putting flowers into the coffin of a child. They tell you their reason for this, which is, that the child must have them to play with. This, too, is a classical idea—the old idea that life of some kind continued dimly in the tomb itself.' The old Roman ideas and observances, under various disguises and after undergoing sundry transformations, still exercise much power, and have much real dominion over the minds of the rustic folk of eastern France. Hamerton shows how strongly the Burgundian peasantry believe in magic and sorcery of obviously classical origin. Their religion, in sundry respects, is in fact but slightly disguised paganism.

A curious instance of the Charon's fee practice from the same country-side was more recently

recorded by the late Sir Mountstuart Grant-Duff in one of his volumes of gossiping *Notes from a Diary*. Writing in 1893, he noted that a lady had told him that her maid, who was a Burgundian, distinctly remembered seeing an old woman at Autun put a sou into the hand of a dead child. She asked the reason, and received the reply, '*C'est pour payer le trajet à Charon.*' 'Could there be,' remarked the diarist, 'a more curious proof of the depth to which Roman civilisation penetrated the Gaulish mind?' The most remarkable feature of this story, if correctly reported, is that the Burgundian woman should know the name and occupation of the Stygian ferryman. One cannot help being a little sceptical, not as to the alleged deposit of the coin—that, no doubt, was actually seen and clearly remembered—but as to the reply attributed to the Burgundian peasant woman. There is, of course, the difficulty, on the other hand, that the reference to Charon was hardly likely to be invented by the most ingenious of lady's-maids, whose classical knowledge is not usually very extensive; but the difficulty of belief in the peasant woman's knowledge and accurate application of it seems even greater.

SOME SHARES IN NIMPIM.

'YOU wrote asking me to call about some business to my advantage,' said Dennis Poldavy Kippen, mining engineer, with acerbity. 'Had I known it was only an invitation to join the directorate of your tin-pot Nimpim Mines I could have said "No" without troubling to come near you. I don't give away my professional experience for the pay of a guinea-pig.' He banged the big consulting-table in the company's board-room with a muscular fist, his rotund, clean-shaven face flushing as he spoke.

Mr Gerald Broun-Catkin, secretary to the concern, a hard-featured little man, elevated his bushy eyebrows in surprise at this outbreak, but he forbore from retaliation in kind. 'In that case, Mr Kippen,' he returned with outward suavity, 'may I inquire why you recently bought a considerable block of what you term tin-pot Nimpims? The share-transfer necessarily passed through my hands, so that I am aware of the transaction.'

Kippen's rather boyish face took on a deeper red. 'That is my affair,' he growled, being given to speaking his mind; 'not yours.'

'I quite agree, but the circumstance explains my troubling you. My chairman — Lord Tinkerton, you know—noticed the transfer; also that the shares had belonged to the late Mr Telmah, who was one of our directors. "By Jove!" his lordship said to me, "if the buyer of these is Kippen the mining-man, it would be worth while asking him whether he'd take Telmah's seat. I've heard Kippen talked of as a rising fellow in his profession, and we are badly in want of some one on the board who understands technicalities." So I wrote you as instructed,' concluded Mr Broun-Catkin.

'It is just as I thought, then,' retorted the engineer, rising to go; 'you want to pick my brains at the price of those of your fancy figureheads. But I don't work on such terms. You'll hear from me as a shareholder,' he added curtly, 'if the company does not get out of the mess I suspect it is in. Good-morning.'

He moved to the door, but the other interrupted. 'Stop a moment!' he exclaimed. 'You are entirely mistaken regarding the terms. His lordship said that if we employed you professionally, of course it would be necessary to pay accordingly. In fact, he indicated that his idea was to suggest to the board that you should be sent out to report on the property.'

Kippen resumed the chair he had vacated. 'Why didn't you say so sooner?' he snapped. 'I have no use for a directorship, but am always willing to talk about professional employment. Go ahead.'

'Of course,' the secretary demurred, 'I have no official authority to explain.'

'I understand; only get ahead. Time is money.'

'You know that our mines are in the hinterland between French and Portuguese Guinea, in West Africa?'

'I know they are said to be in one or other.'

'The company took over and paid for concessions from both. We also sent out a manager, with European miners, and have shipped much machinery in accordance with demands the manager sent home. He indicated that long ere now we might expect gold returns, but none have come; and, to be frank, his recent reports have been erratic, to say the least. Some one must go out.'

'Whoever goes had better pack his clothes in a coffin,' commented Kippen calmly, 'if he prefers closed burial to being planted in the open. The climate usually attends to the preparatory arrangements. What will you pay?'

'What will you go for, and when?'

'Five hundred guineas paid before I leave, and all expenses refunded. I can start at once.'

Mr Broun-Catkin thought that he might with advantage adopt the other's independent tone.

'My directors are unlikely to agree to such an exorbitant fee,' he returned curtly; 'but I shall consult them and advise you soon. Good-morning.'

'As you please,' responded Dennis indifferently. But he wore the appearance of an anxious man as, upon leaving the Nimpim office, he made his way towards Chelsea, where he called at a tiny flat whose door bore the name of Telmah. A tall, lissome girl opened it to his summons, smiling a

welcome from dainty red lips and steadfast gray eyes.

'How is Mrs Telmah to-day, Miss Theresa?' asked the visitor.

'Much as usual,' she returned, 'but more than usually depressed, I fear. She broods so over father's death and our fallen fortunes. But I am thankful to say she is sound asleep now in her own room.'

'Then,' said Kippen relievedly, 'we can talk.'

She led the way into a bare little parlour.

'I think,' he began there, rather abruptly, 'that I shall be able to make that search for you.'

She clasped her hands, her face shining.

'You are a friend indeed!' she exclaimed gratefully. 'But,' she whispered, hesitating, 'will it not be very dangerous?'

'Not if I can keep clear of absinth and gin,' he laughed easily. 'That mixture, with the climate, is certainly risky; but I think I can be fairly drink-proof on a pinch. The curious thing about the affair is that the opportunity to go has come through Lord Tinkerton.'

He watched her closely, and she paled somewhat.

'What a strange coincidence! He was here yesterday again, and I mentioned to him how kind you had been in taking over those unsaleable Nimpim shares of poor father's, and otherwise.'

'I wish you had not told him!' Kippen's brows drew down. 'What did he say?'

'He seemed annoyed that he had not been told the shares were for disposal. He said to mother that she knew he had the best right to help us.'

'Why?' Kippen's eyes were blazing.

The girl's colour came and went again. 'It is hard to tell,' she faltered; 'but it is right you should know—now. He has desired mother's permission to ask me to—to marry him, and she is urging me to consent. She is so tired already of living in what seems poverty to her,' Theresa Telmah added pathetically.

'And you?' There was pity now in his voice.

'You know it is impossible,' she answered, meeting his gaze frankly from tear-filled eyes.

'I know,' he returned grimly, 'why Lord Tinkerton thinks it good I should go to Guinea; he fancies I am too frequently at this flat.'

The girl crimsoned, but did not speak.

'But he does not know,' Dennis continued more cheerfully, 'that the opportunity is just what I would jump at on your account. Keep him at arm's-length, little one, until I return—with what you want.'

She had clasped both his hands. 'Pray Heaven you do!' she murmured fervently.

'Of course I shall,' he assured her; 'but I must leave first, and I'll see you again when I get my marching orders.'

These came with remarkable promptitude, conveyed by Mr Broun-Catkin in person. 'I have seldom been more surprised,' he explained, 'than at my board's acceptance of your very high terms; but the chairman insisted, and most generously offered to pay your fees himself. I have the money here for you, and full instructions and powers. The only condition is that you must start without a day's delay. His lordship has gone out of town, and desires that you will not wait even to see him.'

'I won't,' grunted Kippen. 'I leave to-night.'

He knew he could catch a prompt steamer, and did so. Ten days later he bumped ashore in a surf-boat upon the beach near Konakri, in French Guinea. Shambling across the shining sand towards him came a man in white drill, his face blotchy, his eyes full of feverish light, his gait unsteady.

'My sweet uncle!' he cried, catching at Kippen's hand and missing it. 'Another Britisher, by all that's good, to keep me company in this double-heated Hades! Head's my name—Jerry Head. What's yours?'

He cackled foolish laughter, and the new-comer took him firmly by the arm, having been on the coast before.

'That looks like a café,' he said, pointing to a white-roofed bamboo shanty. 'Let's go there. Now,' he went on when they were seated under its veranda, 'what's your fancy in poisons?'

The wreck leaned confidentially towards him. 'I can get along on absinth,' he answered huskily; 'but that, in the Cape smoke they keep here, makes me feel that I've as many lives as a cat.'

Dennis ordered this concoction, then waited for it to bring increased intelligence to his new acquaintance. 'I'm called Kippen,' he said as the sodden face lit up—'Dennis Poldavy Kippen, mining engineer. And you, I take it, are the manager of the Nimpim Mines. What are you doing down here?'

The man's jaw dropped. 'Good Lord!' he gasped, 'are you to take charge?'

'I am authorised to act as I see fit. Answer my question.'

'I'm recruiting,' Head muttered sullenly. 'It isn't healthy at Nimpim. The other whites went out one time. I planted the lot, then had to come down to pick up a bit, and chase along the machinery—it's mostly bogged between here and the mines.'

'Your reports have not explained all this.'

'Reports be blamed! How do I know what was in them with my temperature fit to warm the pit?'

'What about the reef?'

'It's no end rich. The assayer got four to five ounces a ton everywhere we opened on it.'

'Who was the assayer? I did not know you had one.'

'He came to the coast on his own. Not here—somewhere down Calabar way—a while ago. Was some kind of young swell at home, after hunting or exploring, or such giddy nonsense. He was striking for Timbuctu; but his boys scooted, and he drifted

in alone on us at Nimpim, pretty well expended. I dashed him drugs and nursing, and he began to get on his legs about the time we were sampling the reef. I found he could assay, and asked him to make the tests, for just then I filled up with a dose of fever that rattled me like a disintegrator. I told him to address the results direct to the chairman, and send them down by a special runner; but I reckon he must have been cut up on the road out. Anyhow, I've never had any acknowledgment either of them or of a private letter I managed to scrawl to send with them, saying that Nimpim was as full of fever as of gold, and that I didn't believe any white man could keep alive in the district. I was right'—the manager became maudlin—'because every mother's son except myself is under the s-sod now. Even Ducatt'——

'Was he the assayer?' Kippen snapped.

'Didn't I say so? Even Ducatt is gone, and he was tough stuff. When no reply came to that packet he made up for me he turned down-hearted, and declared he must get home. He filled up with fever again, too, and started one day when he was a bit light-headed. I wasn't fit to stop him, and he has never been heard of since.'

Head's trembling hand tinkled a bottle-neck against his glass's rim, but Kippen gripped his wrist.

'No more now,' he said sharply. 'You start with me for Nimpim as soon as porters can be had.'

Head's brassy complexion blanched to sickly white. 'I'm not fit yet,' he stammered. 'I won't!'

'Then,' retorted Dennis, 'I shall ask the authorities to lock you up on a charge of criminal mismanagement—probably the local prison is even more unhealthy than Nimpim. Buck up, man!' he added, 'and I'll dash you as much of your pet poison as is good for you as we go along.'

Very occasionally brutality backs true kindness. It did so in this instance. Kippen's forceful arguments told, and within forty-eight hours the two had started inland through the reeking jungle. Thereafter Dennis watched over his companion as though he had been his brother, recognising that the success of his mission depended mainly upon the local knowledge locked within the manager's drink-steeped brain. After weeks of painful travel the little expedition topped the summit of a low range, and Head, raising himself in the hammock in which he was being carried, shouted to Dennis, 'There is the darned place!' He pointed downwards towards where a spur from the range jutted into a vast swamp, steamy with malarious mists rising through rank tropical water-growths. This peninsula was comparatively bare, and when they descended upon it they found some rusty iron shanties clustered near some shafts surrounded by snake-haunted débris. There they camped, and, having supped, Kippen issued his orders.

'We'll go below at dawn,' he said to Head, 'and you'll show me what you've done. The day after, I mean to prospect the country close by, and have a palaver with the natives.'

'You'd better leave them out.'

The tone caused Kippen to look smartly up; it held more decision than usual.

Head took a long pull at the extra allowance of liquor which he had claimed in honour of their arrival, then proceeded: 'They are Wotali—cannibals and fiends incarnate. I kept them off before by dashing "squareface" to their boss witch-doctor in casefuls. You have not the stuff to do that, and they'll wipe us out some time. You thought yourself mighty clever, old man,' he leered, 'in forcing me up here; but I've bested you, for now you'll never go down again. Neither shall I,' he concluded recklessly; 'but then I was booked, anyhow.'

'I knew all about the Wotali,' said Kippen; and his companion gaped at the statement and his coolness. 'You've made an extra special ass of yourself,' he went on, 'if not worse. It was not likely I would come up here without inquiring about the niggers; and, as it chances, I have a letter from your assayer, written amongst them. There it is.'

He handed over a dingy scrap of torn paper, which the manager perused with deep interest.

'It's Ducatt's fist,' he muttered, astounded, 'and he says the tribe caught him going down, and won't let him go; but he is sending this out by a passer-by to the coast in the hope that it may bring assistance. Whom did he address this to?'

'To a lady. I have undertaken to find him.'

Head stood erect, for once like a real man. 'You're white clean through,' he declared with lurid oaths. 'I've been worse than mean; but forget that, and I'll swear off drink till this is finished. Give your orders, and count on me.'

'That's bully!' returned Dennis simply, gripping his hand. 'We'll stick to my programme,' he added.

They started to descend the shaft-ladders by the weird, gray light forerunning sunrise. The sinkings were shallow, and the excavations beneath small, so that in the first the engineer soon saw all there was to see.

'Now for the next,' he said, starting to ascend. But he sprang back as a fearful chorus of savage yells, shrieks, and groans sounded down from above.

'Wotali!' cried Head. 'They've rushed the camp!'

'Just so,' Kippen concurred calmly. 'It will save me the trouble of calling on them. But we'll want all our wits to get out of this very pretty mess.' His tone pulled the other together, as he intended. 'You told me just now,' he continued, 'that you had driven a heading from here out to the level of the swamp. Is that heading passable still?'

'We can try, but I doubt it.'

'And I think I saw some explosives down here?'

'Left by mistake,' explained Head.

'Then,' returned Dennis, 'we'll shift the niggers with an earthquake.'

They crawled on elbows and knees along the partially fallen heading, pushing a small box of dynamite tenderly before them to within a short distance of the outlet, where they fixed a detonator to a cartridge, and went on trailing the fuse behind them. Kippen, who led, put his right hand and arm, the former holding his revolver, through the narrow hole on the verge of the swamp in order to draw himself out. The pistol was gently twisted from his fingers.

'Excuse me,' said an English voice; 'but I would prefer not to risk any shooting just at present.'

Kippen struggled up through the dense growth over the entrance, to face a man decorated rather than clothed with skins, feathers, and shells; his skin, where it showed through these, burnt almost black.

'Mr Ducatt, I presume?' said Kippen.

'Yes. And you?'

'I have an introduction from Miss Telmah, who got your letter; but that must wait. Please explain how things stand here now,' Dennis urged.

'I was crazy when the niggers caught me, and, for protection, pretended to continue so until they have come to regard me as a most valuable fetich, and I have had no chance to escape. When they rushed your people I slipped away here to warn whoever might try to get clear by the heading. The Wotali are busy making palaver about going down the shaft to catch you.'

'Head and I have prepared a little surprise packet for them,' remarked Kippen; 'but we can better it now we've met you. Could you tempt them all down?'

'If I went first. Then I could slip out here.'

'I wish you'd work it. We'll wait where we are.'

Ducatt vanished. Within an hour he emerged from the hole.

'I've bagged the lot,' he reported, panting.

'Fire the fuse, Head,' said Dennis, 'and follow us.'

They raced up the slope to the shaft, down which Ducatt shouted, to the amazement of the savages crowded below. Surprise changed to wild terror as a thunderous crash rattled them like peas in a pod.

'You know their lingo.' Kippen turned to Ducatt with the air of a specialist directing a major operation. 'Ask if they are ready to obey.'

'They will obey,' the other interpreted.

'Then they must yield their weapons as they come up, they must furnish us with porters to replace those they have killed, and they must quit this district as a tribe.'

'They agree to all,' translated Ducatt from the frenzied cries that rose out of the pit. 'We may trust them; they have had a proper fright.'

. . . . . .

'I have called to assure you'—Kippen was interviewing Mr Broun-Catkin six weeks later—'that in my opinion Nimpim will soon be paying big dividends. I found your manager very sick; but he has made a wonderful recovery, and has taken charge again. You will, however, require a new chairman.'

'What do you mean?' demanded the secretary.

'It is not a story I can put in my official report. You know he inherited through the assumed death in the Niger region of a cousin named Ducatt. But Miss Telmah, Ducatt's fiancée, received a communication apparently from him, about which, as her friend, she consulted me, and I volunteered to go out to investigate. Just then Lord Tinkerton, who desired to marry Miss Telmah, took alarm at my visits to her, and sent me to Nimpim, thinking the climate would wipe me out. Instead, I discovered that a package, supposed to have been lost, containing a letter from Ducatt, and very valuable assay-results from the mines, had been duly mailed from Konakri to Lord Tinkerton, who suppressed it. Ducatt and I saw him yesterday, when he acknowledged everything.'

'Shocking!' ejaculated Mr Broun-Catkin.

'There's another thing,' continued Kippen. 'You will get a transfer soon for these shares of mine. Your fee paid me very fairly; and, as I don't want more than that out of the business, I'm going to give them to Miss Telmah as a kind of wedding-present. But I won't ask her to complete the transfer until she can sign it as Theresa Ducatt, Lady Tinkerton. That will save you some trouble, I expect. Good-morning.'

IN THE WOODS.

I turn from life's familiar ways
To tread the forest-path again.
The friendly silence of the woods
Seems wiser than the speech of men.

In language I have learned to hear
There comes a message on each breeze.
How could I feel myself alone
With the companionable trees?

And as two hearts in unison
Can hear a thought - though unexpressed;
So I, akin unto the woods,
Find speechless sympathy is best.

How foolish seems our wisdom here!
How small the trivial thing that grieves!
Who would not cast his care away
Who hears the laughing of the leaves?

And miracles by myriads
To eyes anointed to behold
Each little beech-leaf that the frost
Has touched and turned to palest gold.

TENNIEL AND DU MAURIER.

By HENRY W. LUCY.

IN 1864 the gaiety of the nation was eclipsed by the death of John Leech. As a matter of course, John Tenniel stepped into the place of the chief cartoonist of *Punch*, and thereafter, for thirty-five years, week by week, dealt with current history. Fourteen years earlier, on the resignation of Richard Doyle, he joined the staff. Fifty years later, on the 3rd of December 1900, being the date of his jubilee of service and that of his retirement, the usual course of the weekly dinner was interrupted in order to present him with a silver tobacco-box. It bore a brief inscription of affection and farewell, followed by the signatures of the staff, reproduced in fac-simile.

His first cartoon will be found on page 44 of volume XX. of *Punch*. It represents Lord John Russell as Lord Jack the Giant-Killer, armed *cap-à-pie*, advancing to assail Cardinal Wiseman, the agent of papal aggression. To the last Tenniel reproduced his idea of the dog Toby then first committed to paper. But his fancies of Mr Punch and of John Bull in the flesh in course of time vastly improved in individuality and vigour. The original of one of his last cartoons, appearing in *Punch* on the 19th September 1900, he presented to me as a parting gift after long colleagueship. It is of historic value, representing Kruger sculling his boat away from the wreck of the Transvaal. 'The Sinking Ship' it is called, and shows how firm and delicate was the artist's touch even in his jubilee year.

Dining with us one night in Ashley Gardens, and, as was his genial custom, waiting for a last smoke after the other guests were gone, he invited his hostess to make a selection from his cartoons, promising to give her the original. After a prolonged search, of itself a pleasure, she chose a cartoon incidentally marking the infant days of the Fourth Party. Gladstone and Hartington, two majestic figures in knightly panoply, ride in the centre of the picture. By the roadside, drawn as an impudent gamin, a vulgar little boy, is Lord Randolph Churchill jeering at them.

It was one of the fancies of *Punch*, subtly indicative of the situation when Lord Randolph came to the fore, to present him either as a boy or as a man of undersized growth. He was, I should say, fully five feet ten; a disposition to stoop, reproduced in his son Winston, partially detracting from a height that rather exceeded the average. A more marked, deliberately designed playfulness in this direction is shown in the case of Mr Thomas Gibson Bowles, sometime member for King's Lynn, one of the ablest parliamentarians of his day. In 'Toby's Diary' he was always called 'Cap'en Tommy,' and lurid stories were told of his prowess at Trafalgar, and even later sea-fights, where he lost an arm and a leg. E. T. Reed, seizing the idea, always drew him with a wooden leg and a hook where his right hand ought to be.

There is a story of the Ladies' Gallery, which must be true since Mr Bowles tells it, indicating the confusion arising out of this malpractice. The member for King's Lynn interposing in debate (a not unfamiliar habit with him), a young lady in the Gallery asked, 'Who's that?'

'That is Mr Tommy Bowles,' said her mother.

'Oh no!' insisted the inquirer. 'Cap'en Tommy Bowles has a wooden leg and only one arm.'

At the weekly *Punch* dinner I sat almost immediately opposite Tenniel, and for nearly twenty years had the opportunity of benefiting by study of his gentle nature and perfect manner. Among his colleagues there was difference of opinion as to whether he more resembled Colonel Newcome or Don Quixote. Even with the burden of fourscore years on his shoulders, he was one of the youngest at the table. His lithe, upright figure, his ruddy countenance, and his bright look belied his years. Conjoined with a healthy body was a sunny, wholesome disposition. Through an exceptionally long life, brought in contact with innumerable people of varied kind, it is safe to assert that he never made an enemy. His friends mustered in troops, the most attached being those admitted to the closest intimacy. In the wider circle outside the *Punch*

[*All Rights Reserved.*]

office his name is perhaps as familiar as any spoken in the English tongue. It was his mission through fifty years to shoot Folly as it flew, to strike at fraud and corruption wheresoever they raised their heads, to touch with delicate though firm hand the political problems of the hour. This task he accomplished with an unfailing fancy, a delightful humour that never degenerated into coarseness nor was ever lacking in dignity.

As noted, the *Punch* staff took their private farewell of Tenniel on his retirement. The public were not disposed to be left out of the reckoning. He was invited to attend a farewell dinner, at which the Prime Minister, Mr Arthur Balfour, presided. Amongst the hosts were a gathering of men distinguished in various walks of life, the like of which has rarely been seen even in London. Literature, Science, Politics, Art, and Drama were specially and worthily represented.

A touching incident marked the progress of the memorable evening. The Premier having, in one of his most charming speeches, proposed a toast to the guest of the evening—'a great artist and a great gentleman'—Tenniel rose to reply. He was received with an outbreak of cheering that literally broke him down. He had prepared a speech doubtless marked by the manly simplicity that characterised his every word and action. He stood for some moments with shaking hand and quivering lips, vainly endeavouring to recall the opening sentence. The words would not come back to memory. After struggling for some time amid the murmur of sympathetic cheers, he abruptly sat down. It was agreed in conversation that no speech, however pointed and well-ordered, could have exceeded the eloquence of this ungovernable flood of emotion.

'A speech that makes one in love with silence' was Augustine Birrell's happy description of the episode.

Though Tenniel ceased from his long labour, he remained a member of the *Punch* staff. His seat at the Table is to this day at his disposal, and his long clay churchwarden pipe, with his monogram on the bowl, is preserved in the rack. I fancy he intended occasionally to look in on Wednesday nights. Indeed, he wrote to me on the 25th March 1907: 'Now that spring, according to the almanac, has really begun (it's snowing at the present moment), I am looking forward to the happiness of meeting all the dear clever boys again, and, on the earliest Wednesday I can manage, shake hands.'

Only once did he go through the ordeal.

It was an odd coincidence that, where all the rest smoked cigars, he and Keene should have displayed a remarkable preference in the matter of pipes. Tenniel was faithful to his churchwarden. Keene smoked an odd little pipe, one of a collection dug up, it was said, in excavations near the old London Wall. It was very like the minute tube the Japanese smoke, varying inasmuch that whilst the Jap's pipe is made of metal, the early English specimens were clay. The great art of smoking them was to preserve a sod of tobacco left after the pipe went out. Two or three of these would fill a pipe, and Keene's grim face was illumined with ecstasy as he smoked the villainous residuum.

The subjoined correspondence tells its own story:

'42 Ashley Gardens,
21st July 1891.

'Dear Mr Akers Douglas,—I wonder if you have had time to take note of the remarkable—indeed, in the history of British journalism, the unprecedented reception Mr Punch met with on his Jubilee.

'It suggests an opportunity, which I venture to think will not be unpalatable to Lord Salisbury, of the Premier's joining in the tribute. The mainstay of *Punch* now and for nearly forty years past is John Tenniel. His name is a household word wherever the English tongue is spoken. He is one of the few conspicuously successful men who have not an enemy in private or professional circles.

'I do not know whether you are personally acquainted with him. He has friends in several of your colleagues in the Ministry, who recognise in him the very pink of English gentlemanhood.

'I venture to suggest that the Jubilee of *Punch* would be a fitting occasion for the Crown to pay some compliment to the veteran artist. I know such an action would be as much appreciated by the *Punch* staff as if it were conferred individually upon each member, whilst in artistic and general circles it would be acclaimed.

'I should add that I write to you without concert with any of my colleagues, so that if nothing can be done in the matter there will be no feeling of having suffered rebuff.—Yours faithfully,

'Henry W. Lucy.'

'12 Downing Street, S.W.,
July 27th, 1891.

'Dear Mr Lucy,—I have delayed any answer to yours of 21st, hoping that I might have been able to see my chief on the subject. I have not been able to do so as yet, and therefore all I can say is that it will be a great pleasure to me to urge at the first opportunity the claims of Mr John Tenniel.

'I have not the pleasure of Mr Tenniel's acquaintance in the flesh, but he has no warmer admirer than—Yours truly, A. Akers Douglas.'

Mr Akers Douglas was at the time this correspondence passed Chief Whip of the Unionist party, an office known as that of the Patronage Secretary.

Lord Salisbury missed the opportunity of performing a gracious and popular action. In the following year a General Election brought Mr Gladstone into office. I sent Sir William Harcourt a copy of the above letter, asking him to bring the matter personally under the notice of the new Premier. '*Les beaux esprits se rencontrent*,' Sir William wrote to me in a letter expressing warm

approval of the suggestion. Within a few months the knighthood was bestowed.

The subjoined refers to an autograph letter from the author of *Through the Looking-Glass*, of which I had seen a copy. It stated that Tenniel, unable to undertake the illustration of the book, had recommended Doyle for the work. Thinking it would interest Tenniel, I sent him a cutting containing the text:

'10 PORTSDOWN ROAD, MAIDA HILL, W.,
June 12th, 1907.

'MY DEAR H. W. LUCY,—"Tho' lost to sight" ever held in happiest remembrance. I thank you and Mrs Luey very heartily for the two kind letters.

'The little episode in your admirable London Letter concerning Lewis Carroll, *Through the Looking-Glass*, and Dicky Doyle certainly took me rather by surprise, in that I have not the very remotest recollection of the circumstance. How I, in my right mind and perfectly sober senses, could for a moment have thought of persuading Lewis Carroll (failing myself), or agreeing with him in any way, that Dicky Doyle would be equal to illustrating *Through the Looking-Glass*, fills me with an amazement which might well puzzle the best of conjurers.

'When, having, ages ago, forgotten all about it, I saw the little paragraph with poor Dodgson's letter to Dicky in print, it gave me rather a turn to think that what it described occurred just fifty years ago, and that I am now in my eighty-eighth year!

'However, that I am wonderfully well in health "I give Heaven praise," the great trouble being steadily increasing blindness, the mere thought of which fills me with terror and dismay. Even now I read and write—especially write—with difficulty. In which distressful circumstance I can only hope and pray that you and your dear wife will kindly and gracefully forgive this belated acknowledgment of the London Letter, and with ever kindest regards to both, believe me, as of old, very sincerely yours,

JOHN TENNIEL.'

For a man in his eighty-eighth year, dim-sighted withal, the four-page letter is a marvel of firm, clear writing.

At the *Punch* Table Du Maurier was always called 'Kicky.' I spell it so without authority, for I never saw it written. Others write it 'Kiki.' Some 'In Memoriam' notes which appeared in print after his death brought me interesting correspondence on the subject. Burnand wrote: 'Du Maurier was "Kiki," not "Kicky." He got the name in his French student-days. Kiki is a thoroughly French sobriquet.' This is interesting and authoritative. But it is obvious that the French pronunciation of the name so spelt would be 'keekee,' whereas he was always 'Kicky' at the *Punch* Table.

On the other hand, the late Ernest Hart, writing to me at the same date, testifies:

'In an album belonging to my sister, Mrs. Vignal, is a drawing, made many years since by the late accomplished artist, whom we all deplore, of Mr Whistler and himself. It is signed "Jimmy and Kicky." They are walking jauntily along, arm-in-arm, and are excellent portraits of the two friends as they were in the flesh upwards of thirty-five years ago. Subsequent events lend a special interest to this sportive but now plaintive souvenir.'

For more than thirty years Du Maurier had his place at the Wednesday dinner of the *Punch* staff. It was an appropriate but pathetic close to his life that it ebbed out with the finish of a Wednesday. About nine o'clock on the evening of the second Wednesday in 1896 there came to his colleagues at the *Punch* Table a telegraphic message conveying the latest bulletin. It was by no means despairing. It encouraged the hope some clung to that when spring came round, and all nature's best productions brightened into new life, we should have 'Kicky' back again at the Table. Two hours later, at a time when, through ordinary weeks of a long career, he would have been quitting the Table on his way homeward, the end of all his journeys was signalled. He could not hear the echo of Thackeray's grim song round Mr Punch's mahogany-tree:

Here let us sport,
Boys, as we sit;
Laughter and wit
Flashing so free.
Life is but short;
When we are gone,
Let them sing on
Round the old tree.

Of late years he had not been a constant attendant at the Wednesday dinner. As he lived on Hampstead Heath, it was no slight undertaking to dine in Bouverie Street with the prospect of engaging a cabman willing near midnight to brave the final lap of the long journey. He had some humorous stories of his struggles with reluctant cabmen in facing the last quarter of an hour. That through many years he should have attended so regularly was testimony to his affectionate associations with the scene and the company.

In an undated letter, probably written somewhere about 1892, he shrewdly discourses on the difference between his work and that of his old friend Leech. At the foot he drew a dead lion, labelled Leech, and a live jackass, with the initials 'D. M.':

'NEW GROVE HOUSE, HAMPSTEAD HEATH.

'DEAR LUCY,—Very many thanks for your excellently well-written and most appreciative article, which has muchly touched and gratified your little D. M., in spite of the ever-inevitable comparison with Leech, whose aims and methods were the antipodes of mine.

'And indeed I ought not to complain of such a comparison, for if the greatest artist is he who gives the greatest pleasure to the greatest number (in-

cluding myself), Leech is certainly the greatest artist that ever lived. To be mentioned in the same breath (or par.) with him is an honour.

'Even Thackeray himself complained of being constantly compared to Dickens, who was ten times as popular as himself—and didn't even write for *Punch*, and wasn't even dead! Not that *I* am for comparing such featherweights as Leech, Du M., and their likes with the likes of Thackeray and Dickens. The pen is a so much bigger engine than the pencil that the wielders thereof, *cæteris paribus*, stand on very different platforms. I only wish to point out the distinction between the artist (either *penny* or *pencilly*) who tries to depict people as they really are, and the artist who has the enviable gift of so exquisitely distorting them that the sacrifice of truth is more than compensated for by the side-splitting laughter the performance creates. They are really not fit objects for a parallel. The former is too much handicapped by the comparative severity of his aim and method. Not even "the colour of Titian and the design of Michael Angelo" will win him favour when the funny man is by. *Tant il est bon de bien rire!*

'*Contrastez-nous, si vous voulez; ne nous comparez pas!* Briggs's horse is running away with a delightful but impossible person. It's a joyous nightmare; my polo ponies are under the perfect control of gilded youths, whose object is to look their best in the eyes of lovely woman! But beautiful as man and horse can be, if in real life Briggs's horse were to run away with his master across the polo-ground at Hurlingham, I guess the polo-players would be cut of it in the memories of that happy day. Fortunately for them, no man that is being run away with could ever look so funny as Mr Briggs.

'*But*, also, and *en fin de compte*, nobody feels more than I do (who know him thoroughly by heart) that Leech stands alone, unapproached hitherto, and probably unapproachable.

'(I have generally stuck to the "classes" because C. K. seems to have monopolised the "masses." Division of labour.)

'What a long letter! and not very clear after all. At all events, I am much obliged to you for the sympathetic touch with which you have treated—Yours ever, G. DU MAURIER.

'*P.S.—A Mercredi!*—Mitre—Hampton Court.'

He took little part in the keen discussion that leads up to the conception of the cartoon. But he closely followed it, occasionally offered a suggestion, eagerly seized, tossed about pancake-making fashion, and in the main adopted.

It was after the conclusion of stern business that Kicky came to the front. When, as was his custom of summer nights, he took off his coat, lolled back in his chair, lit another of his illimitable cigarettes, and began to talk, his personality loomed large at the Table. He was a delightful conversationalist, his talk lambent with fancy and humour. Those who have never had the pleasure of sitting in his company will find a satisfying reflex in his novels. When he discovered, to his own amazement, that, in addition to being a great artist, he was a born novelist, he created and established his phenomenal success by refraining from strained effort. I do not know any writer whose printed words are more like his ordinary talk than some of the best passages in *Peter Ibbetson* and *Trilby* are to Kicky's after-dinner talk at the *Punch* Table. In reading them, I hear his pleasant voice with its musical intonation of every syllable, a gift that came to him with his French birth.

Here, in a letter from Du Maurier's editor, is a new, perhaps simpler, view of *Trilby*, regarded as a literary work:

'*30th Septbr.* 1894.

'DEAR LUCY,—I think you darkly hinted your willingness to "do" *Trilby* in *Punch*. By all means. It is, as far as I have read it, a decidedly clever as well as an interesting and amusing book; the freshness of the style being marred by the introduction of the commonest, cheapest Music Hall slang of the present day, unintelligible to many now, and Syro-Chaldee to the ordinary reader in the near future. . . .

'The deistic Little Billee sneering to his worthy confidant, a dog, at what he is utterly incapable of appreciating (I do not say of understanding or comprehending) represents that tyrannical braggart school of French Deism (absolute Atheism is impossible) which would, in the name of Liberty of thought, burn, behead, and crucify all who might venture to differ from themselves; as in fact they did in the Great Revolution, and as they did again under the Commune in our own day.

'Of which the sum is this: If you agree with me, just introduce one line suggesting that it would have been better to have curtailed (this contains no covert allusion to the Dog) Little Billee's inordinately long and somewhat commonplace monologue in vol. ii., and still better would it have been (if that monologue were essential to the scheme) to have done as Thackeray would most certainly have done, and reverently answer "the Spirit that denies" in one of those confidential paragraphs of which W. M. T. was a master. —Yrs. truly, F. C. BURNAND.'

On Wednesday nights Kicky was always in the fullest flood of high spirits, his talk irradiated with flashes of subtlest humour. With failing health, he was apt to be influenced by low spirits. Success from a new avenue, sunlit by quite unusual glow of pecuniary reward, came to him too late. He never was the same man after he made his great success with *Trilby*. I remember one night in the early summer of the year of his death, dining with us at Ashley Gardens, he met Lord Wolseley. Talking about Du Maurier's forthcoming as yet unnamed novel, the Field Marshal, with the freedom of an old friend, asked what was its title.

'I think,' said Du Maurier, with a humorous smile, 'I'll call it *Soured by Success*.'

There is many a true word spoken in jest. I am afraid truth underlay this little flash of humour.

Perhaps, after all, the secret of his dolour was failing health. A not too robust frame succumbed to the efforts of an unselfish, strenuous life whose fluttering spread a wide wave of pleasure among mankind. In accordance with his directions, Du Maurier's body was cremated at Woking. The ashes, placed in a casket, were buried under a yew-tree in a corner of Hampstead Parish Church, within sound of whose bells long years of his life were passed. At the open grave, so small that it seemed prepared for a little child, Canon Ainger, long time a close friend, with faltering voice read the solemn passage: 'Forasmuch as it hath pleased Almighty God of His great mercy to take unto Himself the soul of our dear brother here departed, we therefore commit his body to the ground.'

Among the group who stood bareheaded whilst the casket was reverently placed in the grave were Du Maurier's colleagues, most of whom had been present when, on a Wednesday in July, he came down to sit, for the last time, in the little circle his presence brightened for more than thirty years. He looked curiously gray in the face, one sadly remembers, and, to begin with, was unusually quiet. But he brisked up when cigarette-time came, and stayed late in merriest mood. On this day in chill October we had come to bury Kicky, not any more to hear his pleasant talk.

Et puis bon soir.

THE HOUSE OF WHISPERS.

CHAPTER XVII.—DESCRIBES A FRENCHMAN'S VISIT.

'MONSIEUR GOSLIN, Sir Henry,' Hill announced, entering his master's room one morning a fortnight later, just as the blind man was about to descend to breakfast. 'He's in the library, sir.'

'Goslin!' exclaimed the Baronet in great surprise. 'I'll go to him at once; and, Hill, serve breakfast for two in the library, and tell Miss Gabrielle that I do not wish to be disturbed this morning.'

'Very well, Sir Henry;' and the man bowed and went down the broad oak staircase.

'Goslin here, without any announcement!' exclaimed the Baronet, speaking to himself. 'Something must have happened. I wonder what it can be.' He tugged at his collar, to render it more comfortable; and then, with a groping hand on the broad balustrade, he felt his way down the stairs and along the corridor to the big library, where a stout, gray-haired Frenchman came forward to greet him warmly, after carefully closing the door.

'Ah, *mon cher ami!*' he began; and, speaking in French, he inquired eagerly after the Baronet's health. He was rather long-faced, with beard worn short and pointed, and his dark, deep-set eyes and his countenance showed a fund of good humour.

'This visit is quite unexpected,' exclaimed Sir Henry. 'You were not due till the 20th.'

'No; but circumstances have arisen which made my journey imperative, so I left the Gare du Nord at four yesterday afternoon, was at Charing Cross at eleven, had half-an-hour to catch the Scotch express at King's Cross, and here I am.'

'Oh, my dear Goslin, you always move so quickly! You're simply a marvel of alertness.'

The other smiled, and, with a shrug of the shoulders, said, 'I really don't know why I should have earned a reputation as a rapid traveller, except, perhaps, by that trip I made last year from Paris to Constantinople, when I remained exactly thirty-eight minutes in the Sultan's capital. But I did my business there, nevertheless, even though I got through quicker than *messieurs les touristes* of the most estimable Agence Cook.'

'You want a wash, eh?'

'Ah no, my friend. I washed at the hotel in Perth, where I took my morning coffee. When I come to Scotland I carry no baggage save my tooth-brush in my pocket, and a clean collar across my chest, its ends held by my braces.'

The Baronet laughed heartily. His friend was always most resourceful and ingenious. He was a mystery to all at Glencardine, and to Lady Heyburn most of all. His visits were always unexpected, while as to who he really was, or whence he came, nobody—not even Gabrielle herself—knew. At times the Frenchman would take his meals alone with Sir Henry in the library, while at others he would lunch with her ladyship and her guests. On these latter occasions he proved himself a most amusing cosmopolitan, and at the same time exhibited an extreme courtliness towards every one. His manner was quite charming, yet his presence there was always puzzling, and had given rise to considerable speculation.

Hill came in, and after helping the Frenchman to take off his heavy leather-lined travelling-coat, laid a small table for two and prepared breakfast.

Then, when he had served it and left, Goslin rose, and, crossing to the door, pushed the little brass bolt into its socket. Returning to his chair opposite the blind man (whose food Hill had already cut up for him), he exclaimed in a very calm, serious voice, speaking in French, 'I want you to hear what I have to say, Sir Henry, without exciting yourself unduly. Something has occurred —something very strange and remarkable.'

The other dropped his knife, and sat statuesque and expressionless. 'Go on,' he said hoarsely. 'Tell me the worst at once.'

'The worst has not yet happened. It is that which I'm dreading.'

'Well, what has happened? Is—is the secret out?'

'The secret is safe—for the present.'

The blind man drew a long breath. 'Well, that's one thing to be thankful for,' he gasped. 'I was afraid you were going to tell me that the facts were exposed.'

'They may yet be exposed,' the mysterious visitor exclaimed. 'That's where lies the danger.'

'We have been betrayed, eh? You may as well admit the ugly truth at once, Goslin!'

'I do not conceal it, Sir Henry. We have.'

'By whom?'

'By somebody here—in this house.'

'Here! What do you mean? Somebody in my own house?'

'Yes. The Greek affair is known. They have been put upon their guard in Athens.'

'By whom?' cried the Baronet, starting from his chair.

'By somebody whom we cannot trace—somebody who must have had access to your papers.'

'No one has had access to my papers. I always take good care of that, Goslin—very good care of that. The affair has leaked out at your end, not at mine.'

'At our end we are always circumspect,' the Frenchman said calmly. 'Rest assured that nobody but we ourselves are aware of our operations or intentions. We know only too well that any revelation would assuredly bring upon us—disaster.'

'But a revelation has actually been made!' exclaimed Sir Henry, bending forward. 'Therefore the worst is to be feared.'

'Exactly. That is what I am endeavouring to convey.'

'The betrayal must have come from your end, I expect; not from here.'

'I regret to assert that it came from here—from this very room.'

'How do you know that?'

'Because in Athens they have a complete copy of one of the documents which you showed me on the last occasion I was here, and which we have never had in our possession.'

The blind man was silent. The allegation admitted of no argument.

'My daughter Gabrielle is the only person who has seen it, and she understands nothing of our affairs, as you know quite well.'

'She may have copied it.'

'My daughter would never betray me, Goslin,' said Sir Henry in a hard, distinct voice, rising from the table and slowly walking down the long, book-lined room.

'Has no one else been able to open your safe and examine its contents?' asked the Frenchman, glancing over to the small steel door let into the wall close to where he was sitting.

'No one. Though I'm blind, do you consider me a fool? Surely I recognise only too well how essential is secrecy. Have I not always taken the most extraordinary precautions?'

'You have, Sir Henry. I quite admit that. Indeed, the precautions you've taken would, if known to the world, be regarded—well, as simply amazing.'

'I hope the world will never know the truth.'

'It will know the truth. They have the copies in Athens. If there is a traitor—as we have now proved the existence of one—then we can never in future rest secure. At any moment another exposure may result, with its attendant disaster.'

The Baronet halted before one of the long windows, the morning sunshine falling full upon his sad, gray face. He drew a long sigh and said, 'Goslin, do not let us discuss the future. Tell me exactly what is the present situation.'

'The present situation,' the Frenchman said in a dry, matter-of-fact voice, 'is one full of peril for us. You have, over there in your safe, a certain paper—a confidential report which you received direct from Vienna. It was brought to you by special messenger because its nature was not such as should be sent through the post. A trusted official of the Austrian Ministry of Foreign Affairs brought it here. To whom did he deliver it?'

'To Gabrielle. She signed a receipt.'

'And she broke the seals?'

'No. I was present, and she handed it to me. I broke the seals myself. She read it over to me.'

'Ah!' ejaculated the Frenchman suspiciously. 'It is unfortunate that you are compelled to entrust our secrets to a woman.'

'My daughter is my best friend; indeed, perhaps my only friend.'

'Then you have enemies?'

'Who has not?'

'True. We all of us have enemies,' replied the mysterious visitor. 'But in this case, how do you account for that report falling into the hands of the people in Athens? Who keeps the key of the safe?'

'I do. It is never out of my possession.'

'At night what do you do with it?'

'I hide it in a secret place in my room, and I sleep with the door locked.'

'Then, as far as you are aware, nobody has ever had possession of the key—not even mademoiselle your daughter?'

'Not even Gabrielle. I always lock and unlock the safe myself.'

'But she has access to its contents when it is open,' the visitor remarked. 'Acting as your secretary, she is, of course, aware of a good deal of your business.'

'No; you are mistaken. Have we not arranged a code in order to prevent her from satisfying her woman's natural inquisitiveness?'

'That's admitted. But the document in question, though somewhat guarded, is sufficiently plain to any one acquainted with the nature of our negotiations.'

The blind man crossed to the safe, and with the key upon his chain opened it, and, after fumbling in one of the long iron drawers revealed within, took out a big oblong envelope, orange-coloured and secured with five black seals, now, however, broken.

This he handed to his friend, saying, 'Read it again, to refresh your memory. I know myself what it says pretty well by heart.'

Monsieur Goslin drew forth the paper within and read the lines of close, even writing. It was in German. He stood near the window as he read, while Sir Henry remained near the open safe.

Hill tapped at the bolted door, but his master replied that he did not wish to be disturbed.

'Yes,' the Frenchman said at last, 'the copy they have in Athens is exact—word for word.'

'They may have obtained it from Vienna.'

'No; it came from here. There are some pencilled comments in your daughter's handwriting.'

'They were dictated by me.'

'Exactly. And they appear in the copy now in the hands of the people in Athens! Thus it is doubly proved that it was this actual document which was copied. But by whom?'

'Ah!' sighed the helpless man, his face drawn and paler than usual, 'Gabrielle is the only person who has had sight of it.'

'Mademoiselle surely could not have copied it,' remarked the Frenchman. 'Has she a lover?'

'Yes; the son of a neighbour of mine, a very worthy young fellow.'

Goslin grunted dubiously. It was apparent that he suspected her of trickery. Information such as had been supplied to the Greek Government would, he knew, be paid for, and at a high price. Had mademoiselle's lover had a hand in that revelation?

'I would not suggest for a single moment, Sir Henry, that mademoiselle your daughter would act in any way against your personal interests; but'——

'But what?' demanded the blind man fiercely, turning towards his visitor.

'Well, it is peculiar—very peculiar—to say the least.'

Sir Henry was silent. Within himself he was compelled to admit that certain suspicion attached to Gabrielle. And yet was she not his most devoted—nay, his only—friend? 'Some one has copied the report—that's evident,' he said in a low, hard voice, reflecting deeply.

'And by so doing has placed us in a position of grave peril, Sir Henry—imminent peril,' remarked the visitor. 'I see in this an attempt to obtain further knowledge of our affairs. We have a secret enemy, who, it seems, has found a vulnerable point in our armour.'

'Surely my own daughter cannot be my enemy!' cried the blind man in dismay.

'You say she has a lover,' remarked the Frenchman, speaking slowly and with deliberation. 'May not he be the instigator?'

'Walter Murie is upright and honourable,' replied the blind man. 'And yet'—— A long-drawn sigh prevented the conclusion of that sentence.

'Ah, I know!' exclaimed the mysterious visitor in a tone of sympathy. 'You are uncertain in your conclusions because of your terrible affliction. Sometimes, alas! my dear friend, you are imposed upon, because you are blind.'

'Yes,' responded the other bitterly. 'That is the truth, Goslin. Because I cannot see like other men, I have been deceived—foully and grossly deceived and betrayed! But—but,' he cried, 'they thought to ruin me, and I've tricked them, Goslin—yes, tricked them! Have no fear. For the present our secrets are our own!'

(To be continued.)

OXFORD AND EDINBURGH: A CONTRAST.

IT is some time now since R. L. Stevenson summed up in a single paragraph the difference between a university education in Oxford and in Edinburgh. All that can be attempted is to develop the subject along the lines suggested by him, without any of his rare felicity and terse vividness of phrase. Certainly his standpoint is not that of a severely impartial judge, for who can write of his Alma Mater without a bias in favour of her especially distinctive traits? He does not waste much space on the ideal world of gardens, 'where young men of wealth and leisure lead a semi-scenic life, costumed, disciplined, and drilled by proctors;' he concentrates all his playful, loving irony on the 'crowded classrooms,' 'the gaunt quadrangle,' 'the freedom alike from restraint and gentility,' of his own student-days. Even so, the great lines of contrast are there. For the Oxford world is peculiarly and essentially 'ideal.' Nowhere else does a young man get so complete, and yet so 'safe,' a rehearsal of life; nowhere else is reality so carefully concealed, and at the same time so ably travestied. All the elements are there but one: responsibility. Idleness and industry, thrift and extravagance, asceticism and self-indulgence, may all be given a trial without incurring the full penalty of recklessness, and with a quite unnatural likelihood of a reward for virtue. Physical, moral, intellectual self-development, the life of the student, of the country gentleman, of the athlete, of the

politician, even of the journalist or the actor, may all be sampled and thrown aside in the magic years between matriculation and a degree. All roads are open except one—the road to final ruin. Thither the way is barred by those gentlemen to whom R. L. S. assigns such versatile functions: the proctors and their allies. Once transgress the broad limits allowed to youthful extravagances, once show yourself a serious scoundrel, and you disappear from among the players of a game which you obviously do not understand, lest you should tempt them to follow your example and to mistake the rehearsal for the real drama. But if you *will* only 'play the game,' yours is indeed an enviable position. Nowhere else is youth so completely supreme. No other city—not even Cambridge—is so thoroughly a university town. You stand on the Cumnor Hills or on the road above Elsfield, and the beautiful vision of the little, old city—the 'glittering Thames,' the old trees, 'the dreaming spires and antique towers,' all the most familiar features so often celebrated—seems wholly sacred to academic usage, consecrated to the service of some three thousand fortunate young men and of their deferential advisers. It is indeed a city of gardens, set in a country-side which inspired Milton's *L'Allegro* and Matthew Arnold's *Thyrsis*, the sweet, unambitious English scenery which is as lovable as it is distinctive. What a kingdom this for those same fortunate young men! No one ventures to dispute their pre-eminence. The river is the place where they pursue at once the great business of rowing and the amusements of sailing and punting. The stray barges which sometimes struggle up to Folly Bridge on some merely commercial errand look pitifully out of place amidst the swirl of passing eights, with their rhythmic swing and rattling oars. Again, the meadows and the parks are intended (at any rate in their eyes) primarily to give the undergraduates a congenial setting for a Sunday stroll and for week-day games. The inevitable nursery-maids and their charges as well as the other circumambient townsmen are present merely on sufferance. The 'sights' of the city are the colleges where 'the men' reside, the halls where they dine, the libraries where they may read, and above all 'the men' themselves. In the summer they live in an atmosphere of American homage, made rather inconvenient by American curiosity. The High Street is lined with shops competing to supply them with the best purple socks, the best briars and meerschaums, the best sporting prints. What happens to the shopkeepers in the vacation? It is a nice problem; for surely the custom of a stray don or two, chained to North Oxford by examination-papers, cannot tide them over those dreary six months!

The picture is over-coloured perhaps, but still it represents, it is submitted, the undergraduate point of view with considerable accuracy. The University is, as a matter of fact, not co-extensive with Oxford, nor is the undergraduate a synonym for the University. The city has at least one title to fame as the owner, since the days before Domesday, of those twenty-five acres which are now Port Meadow. The senior members, loosely called 'the dons,' are so far from being negligible that the government of the whole University is, broadly speaking, in their hands. In the sphere of university business the omnipotent undergraduate has no voice. Still, the life, the spirit, the broad characteristics of the place are contributed by that 'ever-rolling stream' of four-year generations. To use their own slang, it is they who 'buy' the place. It is their fresh, naïve, half-humorous, half-serious 'experiments in living' which fascinate the townsmen, alternately amuse and alarm the dons, and completely absorb themselves.

In Edinburgh it is a very different story. Here there is no suggestion of the university town. From any one of the innumerable points of view round Edinburgh you may see a sight which even an Oxonian must confess to be by no means inferior to the Elsfield view itself. To the Scotsman, one suspects, there would seem to be no comparison whatever; he would find it hard to grant the Thames valley the title to be considered scenery at all. At any rate, if Oxford be a beautiful city, Edinburgh is above all a fine and noble one. Arthur's Seat and the Pentlands, the Forth and the Highland hills, these form a setting very different from the quaint charm of the Berkshire ranges. It is something more than the difference between Cowper and Wordsworth. In the city itself the Castle Rock rises like a throne above as tangled a medley of human life as was ever swept together helter-skelter into one small piece of hilly ground. But 'swept together' is the wrong word; rather the city seems to have been built up with many years of painful effort, blindly and without plan, into a whole of unconscious grandeur. The whole effect is inexpressibly suggestive of the restless strugglings of humanity, breathless and yet impotent, under the wide sky and among the changeless hills. From the outside, at any rate, it does not suggest the home of peaceful sinecures and philosophic solutions of eternal problems.

From the outside, again, Edinburgh University seems to breathe in a different atmosphere from that of Oxford. Here the amiable fiction that the race is to the young is not so sedulously maintained. The drama seems to be far less of a rehearsal; there is less carelessness and irresponsibility, and a corresponding amount of concentration and narrowness of purpose, a juster sense of proportion. The Edinburgh man has begun the battle of life, the Oxonian is still winning prizes and taking buffets in the lists. Thus in the capital of Scotland the undergraduate feels himself to be a mere by-product, at most a single wheel in a vast machine. His goings and comings to classes or games or meetings make scarcely a change in the traffic of a busy metropolis. He can come into touch at every turn with the big things of life; the real world of wealth

and fashion, the real world of misery and crime, the real world of effort and industry and earnestness are thrown together in exceptional closeness of contact in this most romantic of British cities. So far from living in a sheltered 'grove of Academe,' the Scotch student has an almost unique opportunity of grasping the glaring contrasts, the stirring realities, of life; it is his own fault if he becomes a pedant or a prig, his own merit if he keeps clear of vice and ruin. No one stands to him *in loco parentis* except his own sturdiness of character and his own sense that he must draw a line somewhere. In Oxford temptations are few and safeguards many; in Edinburgh the relations are reversed.

It certainly comes as a shock to the Oxford man to discover that here, as he might say, every one is a 'Tosher,' dons included. By this violent abbreviation of the title of 'unattached student' he is accustomed to express some amount of contempt, or at least of pity. And he finds it hard to understand a university which seems to get along without that peculiar piece of subtle constitutional balance, the relation that keeps together and apart a bankrupt university and a group of wealthy colleges. He is accustomed to professors who only emerge from a course of research to give lectures equally unprofitable (for the schools), to a tutor whose theories on his character and attainments are at once 'futile' and inconvenient, to a double process of extortion under the head of 'Battells' and 'Dues.' He knows that the proctors' fines are a great bulwark of university finance, and that if the proctor be a member of his own college he has a good chance of escaping without the customary five-shilling fine. In brief, he has a sort of intuitive grasp of the principles of a complicated federation, which he is often incapable of turning to account in researches into (strictly) political science. In Oxford, in fact, reality is sacrificed to *esprit de corps*. The Fellows of the various colleges are themselves a close corporation, co-opting to all vacancies, exposed to all the temptations and reaping all the advantages of a common life. To the best type of don the college is at once a mother and a son. Natures of real depth and warmth have found in college business and college teaching an outlet for all their best instincts and a sphere of influence of wide extent and value. The outside world has become for them a battle in which they could best fight by deputy, and many of the foremost combatants have felt that they owed their success to them. The undergraduates, on their side, have an even more intense, though less deep-rooted, patriotism. 'Outcollege men' are their rivals in athletics and in the schools, to be defeated with almost as much zest as the champions of rival universities. They sedulously train themselves to an attitude of armed neutrality and virulent criticism against all but the members of their own college. Amongst a group of the latter they form a bond of the very closest intimacy, a relation which is the distilled essence of friendship. Within these groups may be united men of the most varied tastes and interests, for the link is not necessarily a common course of study, but rather those attractions of type and character whose strength is often far greater than that of mere intellectual affinities. Such friendships are the one abiding treasure conferred by Oxford, the great justification of the sheltered life, the idleness dignified as 'leisure,' the distorted enthusiasms of that parody of the real world. Taking root as they do in a carefully prepared soil of irresponsibility and light-heartedness, they are proof against all the shocks of experience and a permanent connection with the ideal days of youth. The Edinburgh student makes real and lasting friendships too, but they are the friendships of men of the world shaped by common experience, based on common interests; there is in them perhaps more intellectual stimulus—for there it is not bad form to talk 'shop'—but less romance. There may have been a great deal of nonsense talked about the charm of medievalism and the refining influence of 'sweet and solemn cloisters.' But to lean out of a fifteenth-century window into a moonlit garden at midnight discussing ultimate reality with a temporary atheist is a unique experience, with a value quite distinct from the profundity of the conclusions arrived at.

All this militant corporate feeling is very faintly reproduced in Edinburgh. In brief, there is here neither a tutorial nor a collegiate system in the Oxford sense of the terms. The professors and their deputies are directly concerned merely with the intellectual development of their classes as a whole; there is little individual tuition, and even less of that system of tactful supervision which expands itself at meetings of the senior common-rooms, when, it is reported, the purblind don shows an alarming acquaintance with the achievements of recent revellers. The lines of division between the students are thus drawn far more in accordance with their special studies than at Oxford; medicals and 'Old Quadders' tend to live separate lives, and different sets find it hard to maintain an acquaintance with each other's members. At the same time, the Union plays a part as a common meeting-place very different from the Oxford equivalent, where the Library and the Debating Hall are the chief features made use of by the 'best men.' The various 'houses' and 'halls,' too—a kind of amalgamation managed by a committee of the occupants of what in Oxford are called 'digs'—have a measure of corporate life; and university athletics, for those who are qualified to take a part in them, are another common bond. Clubs and debating societies are rife in either University, but the latter especially seem a more vigorous growth in the argumentative North. Still, it is broadly true that Edinburgh, with far greater powers of self-government than Oxford, has far less *esprit de corps*.

Indeed, it seems probable that a good many of the peculiarities which distinguish the two Universities

arise as much from national character and conditions as from the difference of site and history. If Edinburgh University had been situated in a small town, a sheltered valley, since seven hundred years ago, even so it would probably have been something very different from Oxford. The young men who come up to the latter establishment are many of them a closer approximation to the type of Lord Byron than to that of Robert Burns. And in the affairs of men (and of boys) there is a broad distinction between those whose whole ambition is to save money and those for whom the supreme art is that of spending it. It matters not whether the one type fails in its ambition and the other over-cultivates its art; they can never meet on equal terms or see life with the same eyes. Those magnificent young people who employ the 'cabbies' of Oxford to drive them to and from their games, whose picnics on the Cherwell are only one degree less *recherché* than their lunches in college, whose costume is always either extravagantly careless or meticulously correct, who, in fact, are the aristocracy of the University in everything but intellect, have no corresponding type in Edinburgh. Rhodes scholars say that what they have learnt in Oxford is to expect the college porter to touch his hat to them and their scout to call them 'sir.' And no doubt a good number of young men acquire a graceful knack of getting things done for them which may or may not be useful in after-life. But all this bespeaks a degree of civilisation of which the Scotch student cannot boast. The social hierarchy is not so highly organised; the standard of expenditure is considerably lower among those who haunt the Infirmary and the classrooms. The humble tram-car to which the 'blood' cannot be persuaded to condescend is often eschewed from another motive in the North. Here, again, Edinburgh is closer to real life than Oxford. For many men their time at Oxford is the most luxurious they will ever enjoy; they burn recklessly far better coal than they will ever be able to afford in the future; they entertain on two hundred and fifty pounds a year (and debts) on a scale which would mean an income of several thousands in 'married life.' In Scotland, on the other hand, a university career may mean a sacrifice such as may never have to be made again. Instead of four years' idleness to prepare for a dreary and laborious life, it may represent four years' privation to gain the first step towards success. Just as the medical school, no doubt, helps the student to experience of real life while he is 'up,' so when he 'goes down' it holds out hopes of something better than a curacy or an undermastership. At any rate, it cannot be denied that the Scotch student is a far more careful, serious, hard-working person, when he is conscientious or ambitious, than the English; and that his pleasures, if he be so inclined, are, whether innocent or not, at least less expensive. The Scotsman cannot afford to throw a veneer of Byronic romance over his youthful follies or premature vices; there is nothing aristocratic about him whether he is or is not marked out for success in life. Compare the picturesque Gothic of Magdalen or Merton with the dour symmetry of the old Quadrangle, and it is easy to see parallels amongst the types which frequent them.

Still, the student is not perpetually pursuing, with compressed lips and square-set jaw, the road either to hard-earned success or to inexpensive dissipation. Wayside flowers contrive to bloom about his bleak country-side, and he himself occasionally relaxes the tension of effort and goes out to meet that 'lighter hour' which is the constant preoccupation of his southern brother. And here he is assisted by an ally whose presence was not even heralded in R. L. S.'s youth. The absence of college rules and restrictions makes possible a condition of things which gives the lie to Edinburgh's alleged lack of civilisation. The position of women-students at Oxford is one of seclusion, reminiscent of governesses and 'crocodiles.' The undergraduate confronted with the problem of chaperonage is reduced to despair. Indeed, things could not well be otherwise, when so few of the ladies live anywhere but in the Halls, where restrictions and formalities are an essential part of the system. At Edinburgh, on the other hand, there is far more freedom, and etiquette is based rather on unwritten, but therefore doubly recognised, law than on the formal edicts of authority. The women-students play a part in university concerns which is apportioned simply to their interest and capacity. That august body the Students' Representative Council has ladies amongst its members. Debating societies with both men and women members are quite numerous. In fact, there is throughout an atmosphere of open and self-respecting comradeship between students of both sexes which seems to the southerner eminently courageous and sensible. Youthful romances are perhaps not so rigorously confined to the vacations as in the South, but on the whole the young people seem to show a power of regulating their own concerns on certain well-defined principles which might well disappear in a less liberally governed society.

As regards other manifestations of the students' lighter moods, it behoves an outsider to speak with diffidence. But Edinburgh, it would seem, has its characteristic equivalent for those evenings when the less sporting members of the colleges, both senior and junior, are 'screwed up,' or their furniture distrained upon as fuel for a 'bonner;' when, in fact, some college success has to be celebrated with becoming boisterousness. As might have been expected, the 'out-college man' is too much of a stranger to form a welcome ally in an Oxford 'rag.' Noises of all sorts arise far more spontaneously in the absence of members of another college, whose criticisms would probably be unfavourable. At Edinburgh, where the 'classes' have far more corporate feeling, and there is no such strong cross-division to break them up, the natural outlet

for public opinion is the classroom rather than the Quad. We have no desire to reveal the innocent devices by which the undergraduate is wont to distinguish between those whom he respects and those of whom he disapproves. And on the other side, we feel it would be impertinent to investigate the student's methods of adjudicating upon his lecturers. The atmosphere, it appears, is often bracing, and it does not do to show lack of command of your subject if you desire to make yourself heard. At any rate, it is a very different thing to face an organised and critical audience of keen Scotsmen than to harangue politely a heterogeneous collection of Oxonians who will attempt to discourage you only by yawns. Outside the classroom world the distinction still holds. The Oxford undergraduate never realises his corporate unity except at the various athletic contests against Cambridge, particularly the 'Rugger Match.' At the dreary ceremony of the Encænia, it is true, he is expected to be politely and moderately facetious at the expense of the recipients of degrees. Contrast this chartered—nay, almost subsidised—libertinism with what is known as 'the Rectorial.' At a General Election the Oxford term is postponed on purpose to save the undergraduate from the contact of faction. In Edinburgh the students have an election all to themselves, fought out on party grounds and in a spirit of robust partisanship worthy of the best traditions of the party system. Here again the outsider feels his powers inadequate. He can only say that if there were a Lord Rector at Oxford the proctors would have their hands full, and the University chest would ultimately be replenished by a very welcome addition to its contents.

No man can serve two masters, nor two universities. It will have become pretty obvious to which of the two the present writer cleaves. He can only hope that he may be forgiven for the inaccuracies and omissions of the one (and the smaller) half of his treatment of the subject, and for the disproportionate expansion of the other half. After all, can one have more than one Alma Mater, and is she not always the best possible?

DISILLUSIONED.

By A. Fraser Robertson, Author of *A Middle-Aged Romance*, &c.

WHEN Mildred Darvell married Roger Bagstock, and came to settle with her husband in Gilchester, more than one, struck by an indefinable incongruity in the pair, hazarded the speculation, 'What could she possibly have seen in him?' Cynics solved the problem in a word. 'A good match!' they said.

But, for once, cynics were mistaken. The explanation was to seek in quite another quarter. The truth was that Mildred—loitering through a peaceful girlhood among leafy country lanes, living a free, untrammelled life close to Nature, with a visionary student for father and books for companions—had unconsciously caught the trick of idealising; and pre-eminently she had idealised the married state. It represented to her mind, first and foremost, a communion of souls; secondly, a dual pilgrimage through life, in which similarity of tastes, unanimity of pursuits, a common endeavour to uplift and benefit one's fellow-creatures, each played a part.

So, when she met Roger Bagstock at the house of a friend, and he proposed to her, she found no difficulty whatever in idealising his prosaic, unromantic personality; in inserting him, so to speak, as the central figure in the mental picture she had conjured up. Then, too, Cousin Jack's was a fading image. He had been away for so long. She had almost forgotten that he had ever occupied the foreground. Altogether, Mildred was prepared to embark on her new life with high hopes.

One day, on the eve of their wedding, she voiced some of the fervent aspirations of her inmost heart. 'We shall be able to cultivate our mutual tastes, Roger; to ride our hobbies together,' she said to her lover. The unaccustomed plural pronoun held a charming novelty for her.

'We've got to furnish our house first,' came her fiancé's practical response. 'That will take a good slice of money as well as of time.' And he looked serious. A passion for economy had successfully survived the acquisition of great riches.

'But it will be such pleasant work!' she said in her pretty, eager way, like the bubbling of a fountain. Her spontaneity was one of her chief charms. 'We can poke round old shops together, pick up curios, collect odds and ends, and be in no hurry.'

But one day, when they had been married about a month, and were still on their honeymoon, Mrs Bagstock came to the conclusion, *à propos* of the house furnishing, that either her husband had misunderstood her or that she had misunderstood her husband.

'By the way,' he observed, 'about the house. I thought it better to have everything cut and dried, so I gave Marston & Seale orders not to stop short at the staple articles, but to supply all the small things as well—the ornamental as well as the essential; in fact, from attic to basement, to make the house ready for us to step into. I got an estimate first, of course.'

Mildred's face expressed an incredulous dismay. 'You don't mean that you have let Marston & Seale supply *everything*,' she said slowly—'the things that no one could possibly choose but ourselves, all

the little *et ceteras*—the almost personal trifles—that express one's individuality?'

Her husband looked taken aback by her unexpected earnestness, and answered with some asperity, 'Haven't I made myself clear? I have given Marston & Seale *carte blanche* to make the house habitable, down to the smallest detail—to leave nothing out. It will save no end of trouble. I can assure you they know what they are about. You don't need to be afraid of omissions. Their estimate was stiffish, but in a matter of the sort it doesn't do to haggle.'

Mrs Bagstock opened her lips to speak, but on second thoughts swallowed alike her words and her chagrin.

The house, when she was introduced to it, proved to be precisely what she had expected: ornate, expensive-looking, tasteless, stiff, expressive of nothing but the upholsterer's art. And everything had been provided, down to photo-frames and flower-glasses! Mildred's heart sank. At least, they could not provide the photos and the flowers!

'Uncommonly well done!' Mr Bagstock commented, contemplating his possessions with pompous satisfaction. And she, feeling called upon to say something, faltered in reply, 'It certainly seems complete.'

Roger complacently rattled some loose coins in his pocket before going off to the machinery works where he coined the money on which he so unwearingly plumed himself.

The newly married couple did not want for hospitality from their neighbours. It happened to be the season in Gilchester for a succession of ponderous dinner-parties, and to these Roger and his wife were systematically bidden. Mrs Bagstock was pretty and lady-like, and Roger was a man of substance and a power in municipal affairs. The people whom they met at these functions seemed to the young wife inexpressibly dreary, prosaic, and narrow-minded, with no thought beyond their 'common' round, their business prosperity, the vulgar well-being of themselves and their children.

After a series of these, Mr Bagstock proposed to return the neighbours' hospitality.

'And I'll have the thing done handsomely, mind you! No stint about it! No matter what it costs. I want it to be better done than any one else's,' he announced in his bombastic way from the hearth-rug, rattling the coins in his pocket, according to custom.

Then Mildred's irrepressible longing burst bounds. 'Roger,' she pleaded from behind the coffee-pot, 'don't you think we might strike out a line for ourselves? Do let us! Don't let us give one of those costly, dreary dinners, where the sole business is eating and drinking. Let us rather ask one or two congenial spirits, and make conversation and perhaps music a part of the programme.' She coloured, half-abashed at her own temerity.

Her husband's heavy brows met in a frown. Then he guffawed derisively. 'My dear girl,' he said, 'it strikes me you've a thing or two to learn. And the first is that the people who compare a well-cooked dinner and champagne *ad lib.* with a dose of music and high-flown talk don't inhabit this part of the globe. No, no! Do as I say. I'll make out the list. You can write the invitations. And the thing is to be well done, mind you.'

By this time, when her husband's thick lips took that obstinate set, Mildred had come to know that protest was futile, that her only safe course lay in dumb acquiescence.

And yet a few days later she made another attempt to catch the vanishing skirts of those ideals with which she had started her married life. 'Roger,' she said, 'I've been thinking. Couldn't we do something together—you and I—in the evenings, those we spend at home?'

He had a trying way of opening his pig-like eyes to their fullest extent when she made a proposition he considered impracticable. He did this now, frowning, too, in fretted surprise. 'I can't stand your fiddle-faddling games for two—bézique, draughts, and such like,' he returned; 'though I can take a hand at whist when I'm wanted.'

'I don't mean games,' she explained patiently. 'But I've unpacked my books from home. I thought I might read you some of my favourites. Or if you would prefer to read to me? Then there is my music. If you came to the drawing-room, I could play to you. We have been so busy mixing with other people since we married,' she added half-shyly, 'that we don't seem to have had time to get nearer each other.'

'Piano-playing generally sends me to sleep,' he rejoined bluntly. 'But, bless my soul! don't mind me. Go to the drawing-room after dinner if you wish to, and leave me to my pipe.'

'Suppose, rather, I read to you while you smoke in the library,' she suggested, loath to relinquish her dreams of making their dual existence something like what she had pictured it.

'Read if you like,' he assented ungraciously.

She had long ago unpacked her treasures from home. The house had seemed less dreary since her books and music had arrived. Her fingers fluttered uncertainly over her bookcases while she made her choice. Would he like a volume of poems or of essays? Better perhaps begin with the essays, she told herself. She fixed on Emerson's *Society and Solitude*. Her heart swelled high with hope. She would yet save their life from becoming engulfed in this sordid materialism that threatened it!

She put on one of her prettiest frocks, and after dinner crossed the hall to the library, her hand linked affectionately in her husband's arm.

They took easy-chairs on either side of the hearth. Roger lighted his pipe and intimated in a tolerant tone that she might 'fire away.'

She opened her book and began a little nervously. She gathered courage as she proceeded. Roger smoked. His silence seemed to say that he was interested. She had struck the right note at last!

Books were to prove the bond, the lever by which he was to be raised out of the slough of materialism into which circumstances had sunk him. They were to penetrate the thick crust by which his higher nature was being overlaid. An agreeable glow warmed her at the thought.

She knew she had a pleasing, musical reading voice. She became aware presently, without looking up, that Roger had knocked the ashes from his pipe and laid it on the chimney-piece. He was apparently too much absorbed to light another. Elatedly she read on, throwing all her heart into her occupation.

Suddenly a sound struck on her ear—regular, rhythmic, stertorous. She looked up in startled amaze, to be succeeded by chagrin, then bitter disappointment. Her audience was *asleep!*

Thus abruptly brought to earth, she contemplated the heavy, sensuous features before her, the puffy closed eyes, the half-open mouth, the large limbs luxuriously relaxed in repose. She listened to the placid snoring with almost a feeling of repugnance. Her book had fallen shut on her lap. Gradually the muscles of her face began to work. Two difficult tears gathered in her eyes and rolled slowly down her cheeks. 'It isn't any good,' she said to herself with a voiceless sob.

But Mildred Bagstock was not easily discouraged. And she had begun her married life with such high ideals, such dreams of congenial companionship, of purposeful living! She could not relinquish these without a struggle. If the cultivation of mutual tastes was an impossible bridge with which to span the gulf that divided her and her husband, what of philanthropy—the benefiting of others? Did that offer no opening? She would at least try it.

Circumstances favoured her.

'Roger,' she said one day, 'Mrs Selwyn has been here. She is greatly interested in the scheme of benefiting the navvies who are coming to construct the new railway line. She is anxious to rouse the people round. Her idea is to get up a drawing-room meeting, with suitable speakers. But her room is too small. She asked me if I would lend ours. I feel very strongly that, surrounded as we shall presently be by this class, their moral and physical welfare constitutes a very real responsibility.'

She had got thus far when her husband looked up from his morning paper and cut across her.

'The less you take to do with the navvies the better,' he said, and 'clicked' his tongue against his teeth in a final way peculiarly abhorrent to her. 'As a class, they are degraded and depraved to the last degree.'

'But, Roger,' she pleaded, 'isn't it all the more our duty to do what we can to elevate them?'

'I won't have you mixing yourself up with anything of the sort,' he said dogmatically. 'I have no sympathy with the thing. Isn't your life full enough as it is, with your social duties, your calls, the ordering of your household, the exercising of your horses, that you must needs go meddling with outside affairs? I'm sure you've had enough of gaiety since you came north to satisfy most women!'

'Oh, you don't understand, Roger!' she cried, goaded to self-defence. 'It isn't *that* I want. Calls, and long, heavy dinners, with dull, commonplace people, whose one idea is pecuniary prosperity! I am sick and surfeited with these things. I want to *do* something with my life—to improve myself, to make the world a shade better, to help some one upwards. I have a soul as well as a body, Roger, and my soul is being starved!'

It was an occasion for Mr Bagstock to open his eyes to their widest and to fix them in disapproving astonishment on his young wife. What high-flown rot she talked at times! She ought to be made to drop some of that ridiculous sentiment of hers. He hated a woman to go into heroics over nothing.

'If you ask me,' he said irritably, rattling the inevitable coins in his pocket, 'I call you confoundedly discontented. It seems to me that you have an uncommonly good time of it all round. Yours is a lot most women would envy. Money, comfort, fine clothes'——

She broke out in an ejaculation of repulsion, throwing out her hands as if to ward off the hateful words. 'Money, comfort, clothes!' she echoed. 'Are these all one has to live for? Does life offer no nobler ambitions?'

He chose to be offended. Bluntly regardless of other people's feelings, he was yet, like many of his type, astonishingly sensitive where his own were involved. 'I'm afraid, having married me, you'll have to be content with what I've got to give you,' he said in deeply injured accents. 'It seems to me' —with a clumsy attempt at irony—'that, considering what I took you from, you are not exactly to be pitied. The world, in fact, might even call you lucky.'

She turned wearily away. She did not attempt to soothe him as she sometimes did when he flared up, or to smooth away her own offending statements. A hard, despairing recklessness seemed to have taken possession of her. Every finer feeling was dried up, warped, shrivelled.

'Content with what he has to give me!' she echoed when he had left her. Her hands clasped each other loosely in her lap; her head drooped dejectedly forward. 'Poor fool that I was, to imagine that marriage with *him* could ever be a union of souls!'

It was a few weeks later that her cousin Jack came home from abroad. She had, in a measure, lost her soft, rounded beauty, her pretty, eager, spontaneous manner. She had grown dull and apathetic. He came to lunch. Roger Bagstock was never at home for lunch. Jack found a smartly dressed woman, her once gracious manner grown hard and metallic, her beautiful face mask-like, stiffened into the semblance of a statue. He voiced

his startled surprise without thinking. 'In Heaven's name, Milly, what have you been doing to yourself?'

She coloured hotly, quivering at his words. Then gradually, beneath the rush of glad emotion the sight of him brought, the old crowding memories, the interest of hearing his experiences, the subtle delight of being with a kindred spirit, the metallic manner softened and melted, and left her the old Milly he had loved ever since he could remember. But as she became soft and gracious as of yore, he himself grew tongue-tied. His pulses throbbed in wild, uncontrolled fashion. The awful conviction swept over him that she was unhappy.

When he was leaving her his self-control broke down. In an agony of resentful compassion, of impotent sympathy, ambiguous, unconsidered words poured impetuously from his lips. Crushing her delicate fingers in a fierce grip and looking into her beautiful, changed face, his own twitching the while and the veins standing out like thick cords, he stammered, 'Milly, remember, should you ever want help, you have but to command me!'

She was strangely moved by his vehemence and a certain undefined electricity in the air. He left her trembling.

Ah, what a day it had been! In the sunshine of his companionship her withered soul had seemed to expand again. The warm glow of mutual interests had animated her. A new life had pulsed in her veins. She had basked again in a fellow-creature's sympathy, thrilled to his broad, generous views of life.

That night, how happened it that every single detail of her sordid surroundings seemed to stab her separately and individually? How was it that she recoiled with an irrepressible repugnance from her husband's presence, that all the ugliness of his familiar ways suddenly stood out in jarring, accentuated relief? He seemed to eat more noisily than usual. Her sensitive ears shuddered, though she had fondly imagined they were growing dulled and accustomed. And, oh crowning offence! why, after dinner, did he undo the lowest confining button of his waistcoat? Why did he rattle the loose coins in his pockets, straddling on the hearth-rug (his favourite attitude), looking out on his possessions—herself among the number—with the aggressive complacency of the prosperous self-made man? Why, oh, why, finally, did he goad her to her doom?

She made a last appeal with the desperate instinct to ward it off. 'Roger,' she pleaded, unaware of the ring of entreaty in her tones, 'let me have Clare and Harold for a week's visit. You know I haven't seen them since my marriage.'

A swift frown furrowed her husband's heavy brows. 'Clare and Harold!' he echoed. 'No, thank you! I am not particularly inhospitable, but that type of visitor doesn't appeal to me. Propose some one a little less stilted and a little more human than that high-flown sister of yours and her impecunious curate, and I may consider it. I couldn't live up to them.'

'But you would see so little of them,' she urged. It was against her principles to remonstrate with him, browbeating being the invariable tactics with which he met that species of warfare. 'You are away all day. You have even taken to working in the evenings.'

'And aren't you the last who should complain?' he snapped at her, in ready offence. 'Who benefits more directly than yourself, pray? Compare your circumstances with your sister's, for instance. She's hardly better than a pauper, while you want for nothing that money can give. Look at me!' He swelled himself out. 'Is there a better or more successful business man in the country, though I say it, that shouldn't? And while other men have been pitch-forked into positions, I have myself alone to thank—my own sheer, dogged push and perseverance.'

'Oh, I know, I know!' she said wearily. How sickeningly familiar was the well-worn phraseology! 'But, Roger, money isn't everything,' she reminded him, fixing him with dumb, appealing eyes.

'It's a biggish bit, if it isn't the whole,' he retorted sententiously.

She sat still, utterly baffled and defeated, when he had left her. She had been like a bird beating helpless, broken wings against its cage-bars. A choking sensation was in her throat at the veto on her sister and brother-in-law. But she was long past the tearful stage, even farther removed from the beseeching one. *She realised that there was no escape for her!*

She was very quiet over her next move, merely dry-eyed and desperate. She deliberately took pen and paper, and scribbled a note to her cousin: '*I can stand this no longer! I am going to you.*—MILLY.'

Then she folded, sealed, and addressed it. She would post it later, so that Jack would have it the first thing in the morning. When she had laid it away in her davenport she wandered feverishly over the house, from one ugly room to another, a burning spot on either cheek, an ominous glitter in her eye. She took up a book, then laid it down; opened the piano, only to close it after half-a-dozen bars.

Roger was late that evening, but that was nothing unusual. He was so absorbed in his money-grubbing that he usually allowed himself bare time to dash home in time for dinner. Presently she noticed that a cab stopped before the door. Voices sounded in the hall—strange voices. He had brought home a friend, but her eye did not brighten at the thought. It would inevitably be a man who would talk 'shop' all through dinner, that dreary, sordid theme of 'profit and loss' that she sometimes thought would take her brain, as if life were made up of £ *s. d.*

Then the servant's voice was in her ear: 'Mr Bagstock is in the library, ma'am. The doctor is with him, and Mr Beveridge. He has met with an accident at the works.'

She went downstairs, something seeming to clutch at her heart-strings.

Her husband was lying white and still on the couch. There was nothing shocking in his appearance, only the stunning contrast between him as he now looked, white, helpless, inert, and him as he had looked a few hours earlier, in the full flush of health.

He opened his eyes at her entrance. She went and bent over him. 'Milly,' he whispered, 'don't leave me!'

'Grave internal injuries.' That was what the doctor told her. He had fallen into the well of the hoist. It was a miracle he had escaped with his life. 'No, no bones broken; but the case more delicately complicated—in reality, worse than if there had been.'

They got him to bed.

'Mr Bagstock is asking for you,' they told his wife when he was settled. She went to him at once. He was lying, white and still, with closed eyes, but they opened at her entrance, and his hand beckoned dumbly. She bent her ear to his lips.

'Milly, stay with me!' he whispered.

'Of course, Roger,' she said, and gave an involuntary guilty start.

Half-an-hour later a sudden recollection made her furtively seek to withdraw her fingers from his clasp, but he resisted tentatively.

'Only for five minutes,' she breathed in his ear. 'I promise to be back in five minutes.'

He let her go at that. She opened the door and sped swiftly and noiselessly along the passage to her room. With unfaltering fingers she unlocked her davenport, lifted a note from the top, and tore it in a dozen pieces.

That night the doctor said, 'I've sent for a couple of nurses, Mrs Bagstock.'

'Only one, please,' Milly said firmly.

'But it may be tedious,' he urged.

'Even so,' she returned.

Tedious! The days lengthened to weeks, and the weeks to months. Life was no longer made up of ponderous social functions, rounds of calls, dreary country drives, but of the narrow limits of the four walls of a sickroom. And yet for the first time since her marriage it seemed to Mildred Bagstock that she *lived!*

'Stay beside me! Do not leave me!' It was the constant reiterated refrain of the dying man. He was like a child. His utter dependence roused in his wife all her latent maternal tenderness. Repulsion changed to pathos, contempt to a passion of pity. She did not spare herself. She refused to leave him almost for needful food and air. Doctor's prohibitions, relatives' protests, were powerless to tempt her from the sickroom. Was it merely the pathetic, clinging dependence of the strong man that moved her, or did an unspoken gratitude for escape from deadly peril prompt her? Whatever it was, she remained with him to the end.

. . . . . .

And Jack never knew—even after he had claimed her for his wife, and she had begun to realise some of her early aspirations, to taste something of that congenial companionship for which her soul had so passionately hungered—never knew how near she had come to wrecking his sacred ideal of her.

SHOULD NEW CALEDONIA BECOME BRITISH?

By JOHN GAGGIN, Author of *Among the Man-Eaters, &c.*

To the hearth of our people's people,
To her well-ploughed, windy sea,
To the hush of our dread high altars
Where the Abbey makes us we.
To the grist of the slow-ground ages,
To the gain that is yours and mine,
To the Bank of the Open Credit,
To the Power House of the Line.

Once—in our time—is there a man?

RUDYARD KIPLING.

IT is being rumoured all over Australia that the people of the French colony of New Caledonia, in the western Pacific—white and black alike—are preparing a large petition to the Government of France, praying for the cession of the island and its dependencies to Great Britain, and the matter will shortly be placed before both Governments.

Would it not be most advisable, for all concerned, that such a transfer could be effected, firstly, in the interests of the New Caledonians themselves; and, secondly, to the advantage of ourselves, Britishers and Colonials alike, perhaps also much to the convenience of the Republic? There are not many French residents—apart from the officials—in the group, and it is a subject of common report that the colony costs the French Government a very large sum annually in the form of subsidies, and yet the people are restless and far from contented. For some years now criminals have not been sent to the island. The home Government gets little or nothing as a set-off in return for its very large yearly expenditure. The natives (all of the great Melanesian race) to a man much dislike also their present white rulers, and two or three native risings have had to be put down with a heavy hand.

In this connection, some years ago the writer happened to be in Noumea for the first time, the chief town of New Caledonia. Wishing to see the city, I rose at 5 A.M.—not a bad South Sea habit in a warm land—and hied me to the streets.

Presently I met a stalwart native standing in the middle of the empty roadway, with half-a-dozen sticks of sugar-cane and a dozen 'drinking-nuts' (young cocoa-nuts), the ice-creams of the Pacific. I speak many native languages, so I went up to the fellow, proposing to trade; and as I approached, spoke in dialect after dialect. But when I got within a few yards of the big fellow he gave a loud snort, took to his heels, and fled out of sight. I secured the nuts, &c., and returned to my friend's house. I met the frightened one in the town afterwards, went up quietly, took him to a shop, and made his heart glad with pipes, tobacco, a red *sulu*, and a bunch of beads. He knew my nationality after a little, and then became very friendly. Now, in no British possession would a native clear out in this way from any of us.

Would it not be well for our old motherland to offer the island of Mauritius to France in exchange for New Caledonia? Of course, as is well known, the latter is much larger than the Isle of France, being about two hundred and fifty miles in length by thirty broad; but then much of the land is sterile and unproductive, while the lands of Mauritius are among the most fertile in the world. There is not a sugar-estate in New Caledonia, while Mauritius is full of them. The Seychelle group of small islands, close to the Isle of France and Réunion, might be thrown in as a *quid pro quo* for any interest the French hold in the New Hebrides (there are less than three hundred French residents there), and also the Loyalty Isles (Lifus), close to New Caledonia, whose natives are Protestants to a man. The political prisoners now kept at the Seychelles could easily be removed to the Andaman Islands, already being used for such purposes. The good taste of our allies may well be trusted to preserve the unique coral church at Mahe, the largest isle of the Seychelle group.

The whole thing seems a fair bargain for both sides, and calculated to preserve the *amour propre* of our neighbours over the way. The inhabitants of Mauritius are also of French extraction mostly, and would probably hail with delight the exchange. The island is close to Madagascar, which Lord Salisbury, for some unexplained reason, gave over to France some years back to do as she liked with. Closer still is the island of Bourbon, where likewise the reunion would be received with much joy. The sugar of Mauritius would also doubtless completely stop the importation of the German beet product into France.

Thus would all French interests be conserved about that coast, and certainly lead to French colonial prosperity and trade extension there.

From our own British Imperial point of view—at least so it seems to a mere oversea colonial—the exchange would be very advantageous to all concerned. The group could be added to the Fijis or the Commonwealth, or even form a separate colony, and its mineral resources of nickel, cobalt, and even a little coal could be developed as never can be done under present conditions. The island is surrounded by British possessions on all sides, and is close to Queensland. The group was even discovered by our own Captain Cook in 1774. There are few French—as I before observed—apart from officials. The settlers on the land are from everywhere but from France, while the contrary is the case in Mauritius. Of late years this latter island has lost much of its strategic, political, and commercial importance, to us at least. The sugar it now exports is a mere bagatelle to that from the Fijis and North Queensland, and, although worthy of consideration from a French standpoint, can affect us not at all. Of course we all know the island is surrounded by glorious memories of military and naval achievements in the past; but what part of our great Island Empire has not such? it may be asked. Also, is it not very probable that in a few years, when the Panamá Canal will be completed, much more British shipping will frequent these Southern Seas than is at present the case?

Perchance, if an exchange so manifestly advantageous to both sides were brought about, it might mark an epoch not only in our 'old, old island story,' but also in the lives of both Mr Asquith and the Earl of Crewe, the present Secretary for the Colonies, and lead mayhap to new and unthought-of harmony between this country and La Belle France. At all events it would remove a cause of frequent friction as to the New Hebrides, and act as oil on the machinery of Franco-British friendship. Of this there can be little doubt. The whole matter seems well worthy of the very grave consideration of both the British and French Governments. It need hardly be remarked that such an exchange, if it could be made, would be much appreciated alike by Australians and New Zealanders, who, so to speak, are on the verge of the Empire.

TO LOVE.

Oh, let me gaze into those eyes of thine,
And dream the days away!
Feast on the treasure of their love divine,
And learn what they would say.
Then, Love, this life shall have no care
If thou art there.

Oh, let me press those lips to mine,
And taste the sweetness of their love!
Earth has no charm to equal thine,
Nor yet the heavens above.
Life cannot give a greater bliss
Than thy sweet kiss.

Oh, let me have thee all mine own,
And let me live in thee!
Thy heart, thy soul, be mine alone,
In life, death, and eternity.
Then, Love, the future all shall be,
Happy in thee.

THE HEART OF THINGS.

By Henry Leach.

London, *Yesterday.*

WHAT are called statistical abstracts have generally an uncommonly dull appearance when they emanate from Government departments; but such appearance is often proved to be deceptive when the figures presented come to be grouped and analysed. Any son of Britain who takes pride in the Empire may derive most pleasurable entertainment from examination of an official compilation lately issued dealing with the extent and some of the existing circumstances of that Empire. The book has a forbidding look, but it is found to be like a fairy tale of power and progress during the last fifteen years. It is told that there are now 11,332,000 square miles of territory under the Union-jack, and that the number of people living on it in 1901, which is the latest year for which complete figures are available, was 385,357,000. Thus there is an average of thirty-four persons to each square mile. When the census was last made it was discovered that Calcutta had assumed the place of second city of the Empire, which distinction had previously been held by Bombay. The population of Calcutta has been increasing at a very rapid rate during the last two decades, and it now stands at only a little over seven thousand short of the million; Bombay is only a few thousands behind, and occupies the third place in the Empire list; while Glasgow comes fourth, more than a hundred thousand less. Amazing increases are shown in the cases of Montreal and Johannesburg. In the former case the population in 1891 was 219,616, and it is now 450,000; while Johannesburg in 1891 contained but 26,000 people, and has now 188,000. It was found, when the numbers of the live-stock of the Empire were reckoned up in the year before last, that there were 8,000,000 of horses, over 100,000,000 of cattle, and over 200,000,000 of sheep. Within the brief period of ten years a most astounding development in the production of minerals has taken place. In 1897 some £4,500,000 was the worth of the diamonds obtained, while in 1907 it was nearly £9,000,000. The production of gold rose in the same period from £14,000,000 to £50,000,000, of silver from less than £1,000,000 to nearly £3,000,000, of coal from £64,000,000 to £134,000,000, of copper from £1,500,000 to £6,000,000, and of tin from a little over £3,000,000 to £10,500,000. And in these ten years the cotton grown within the boundaries of the Empire increased from 992,000,000 to 1,235,000,000 pounds, and the tea from 270,000,000 to 430,000,000 pounds. We are told that in 1893 the value of the foreign and inter-Imperial trade of the Empire amounted to £902,000,000, and that by 1907 it had risen to the wonderful total of £1,667,000,000. Foreign trade was 74·2 per cent. of the whole, and inter-Imperial trade 25·8 per cent. It is all a dazzling tale of millions and millions, and a constant multiplication.

* * *

These are the days of income-tax anxieties and of many arguments and indignant protests arising therefrom, and some other statistics which were got out a little while since have a special interest now. It was found that there are only twenty people in the country who pay income-tax on larger sums than £50,000 a year; but there are 241 people who have the problem set them annually of disposing of from £10,000 to £50,000, and there are more than twice as many who have from £5000 to £10,000 to live upon. Less than 1000 persons are returned as having from £3000 to £5000 a year; but there are 1539 who have from £2000 to £3000, and 6155 who have between £1000 and £2000. A separate reckoning was made of people who come within the category of employés, and it was ascertained that there are only four who pay on incomes of between £5000 and £10,000, eleven on incomes of from £4000 to £5000, nineteen on incomes between £3000 and £4000, and fifty-five who, on their own showing, are paid from £2000 to £3000 a year for their services. Further, it is said that these figures do not include Government, Corporation, and public company officials, of whom 114 are

[*All Rights Reserved.*]

tabled as being assessed on incomes exceeding £5000, 144 on incomes between £4000 and £5000, and 236 on incomes between £3000 and £4000. Although poor people may not derive any particular pleasure from the contemplation of the riches of others as here indicated, they have some material for the framing of those ideal budgets of theirs which are adapted to their own special circumstances. The contemplation will also inevitably create certain doubts. Many people will ask, for instance, whether it can really be that there are only fifty-five 'employés' in the country whose earnings range between £2000 and £3000 a year, and also whether all the 'employés' who get from £4000 to £5000 can be telling the truth about their affairs when it is found that those who declare themselves are only a little band of eleven all told. But whether he is a poor man or a rich one himself, the sceptic, one surmises, has generally a large fund of sympathy for the persons who are overmodest in their declarations to the surveyor as to the extent of their resources. There is year by year a serious record of overassessment by the surveyors which in a certain measure seems to some people to justify little deceptions that may be practised by the taxpayer. It has been shown that in one instance there was overassessment to the extent of £13,000, and that when the Commissioners were considering the inflicting of penalties of over £3000 for underpayment they found instead that they must order the repayment of nearly £400. In another instance, when £220 was claimed a repayment of £7 had to be made instead. The year before last the Treasury had to repay nearly £3,000,000 sterling, but only did so after the sufferers had gone through a long process of claim before a special department. The case has been quoted of a London chemist who was assessed for two consecutive years at £800, although he well knew that his profits did not reach anything like that figure. However, he paid without protest; but when in the following year the greedy surveyor increased the assessment to £1200 he took advice, and a full examination of his affairs showed that he was making only £335 a year. He was, therefore, entitled to an abatement of £150, and the result was that instead of paying on £1200, as he was told he must, he eventually paid on £185 only.

* * *

Just before the assembling of Parliament for this present session the chiefs of State had a very considerable fright. The story goes that one of their number lost in the street a document, the contents of which were of extreme importance, and which it was necessary should be held in the strictest secrecy. It is said that the Prime Minister in calling a meeting of the Cabinet issued a summons to each member, in which the agenda of matters to be discussed was briefly set forth. At all times such communications are obviously of the most private and confidential character; but this one was particularly so from the circumstance that one of the matters mentioned had reference to certain proposals for national defence in relation to foreign armaments. It may or may not have been the case that the document would have been valuable to some foreign Power; but it was distinctly unpleasant to have no knowledge as to its whereabouts, and that too at the time that the King and the Kaiser were associating in Berlin. The loss, so it is related, was not discovered until the Ministers assembled in Downing Street, when the delinquent searched through all his pockets in vain, and a general consternation was created. Eventually the one who was the cause of all the trouble went home in a very unhappy frame of mind, but some time later was vastly relieved on a servant-girl calling at his house with the document in its official envelope, the address upon which had enabled her to do so. She had found it in the street! The Prime Minister was promptly informed of the safety of the paper, and the mind of the Cabinet became serene again. This is not the first time that Cabinet documents have thus gone astray. One time, just before the Home Rule Bill of 1893 was introduced, a confidential copy of it was left by an absent-minded Minister on a table in the library of the Reform Club, and it was only when he had reached Whitehall that he discovered his loss. Much alarmed, he hurried back to Pall Mall, but just when he was entering the club again he met his private secretary with the bill in his hands. It was a most fortunate coincidence that this gentleman had chanced to see it lying on the table almost as soon as his chief had gone, and he captured it before any one else had an opportunity to glance at it. The enormity of such offences as these is best appreciated when it is understood what extreme precautions are taken in advance to ensure absolute secrecy. When these documents are sent to be printed the work is distributed among a large number of trustworthy compositors, each man being allowed to set up only two or three lines of type, so that he can have no knowledge about the general contents or meaning of the whole thing. The fragments are then arranged in order by a confidential overseer, and after the necessary number of printed copies have been struck off the type is at once broken up. Each copy is delivered by hand to the Minister for whom it is intended.

* * *

People heard a little while since about a certain measure of rest and self-effacement which were said to be contemplated by the Kaiser. It is possible that the individual element in German government may be less prominent and forcible in the future than it has been in the past; but there are already many indications that the nervous restlessness of the Emperor is not to be overcome, and those who care more for an intensely interesting study of human nature than for much-discussed difficulties of diplomacy, some of which may be real and others imaginary, will not regret that this is the case. One who has had a close connection with Court affairs at Berlin related to us lately some interesting

particulars concerning the amazing energy of this monarch, and some characteristic anecdotes. It is said that a kind of semi-official examination was once made of the amount of work of a governmental sort that had been done by His Majesty in the course of one year, and it was then revealed that he had attended to 5857 matters belonging to foreign policy, and to 50,134 affairs of home government. During this period his military and naval Cabinet sent out over a hundred thousand despatches, and it was declared that in a large proportion of cases the Kaiser himself dictated them. On an average his political Cabinet forwarded four hundred letters or despatches every day, and on occasions of national fêtes or the birthdays of members of the Imperial Family as many as two or three thousand have been sent out. It was added that beyond all this the Emperor wrote with his own hand in that one year no fewer than seven thousand personal and private letters. There seems to be a certain fitness in all this when it is remembered that the Fatherland indisputably holds the title of being the most letter-writing nation of Europe, for it has been shown that in one fiscal year of the International Postal Union it sent a total of nearly eight thousand million pieces of mail-matter, while Great Britain and Ireland had less than five thousand millions to their credit, France more than a thousand millions less than that, while Russia and Italy each sent only about a sixth of what Germany did.

* * *

One good story that may be told, with the authority that has been mentioned, has reference to a statue of Bismarck which the Emperor had ordered to be designed with a view to its being placed in a certain cathedral. The commission was given to the sculptor Begas, who in due course completed the work, in which he represented Bismarck as the guardian angel of the Hohenzollerns. The first the Emperor knew about the nature of the design was when the finished statue was submitted to him for his approval, when, in the most candid terms, he expressed his displeasure. 'What nonsense!' he exclaimed. 'We Hohenzollerns need no protector. We protect ourselves!' Thereupon he gave orders that the statue should be destroyed, and at the same time sketched a new design himself, showing Bismarck as a medieval German knight, and gave it to Begas for his guidance in making a new statue. We are told that, despite the alleged new programme of self-effacement, the Kaiser's vivacity in private life, so far from being diminished, increases, and never did man appear to be less careworn and unhappy. And in this private life he is quite famous for his charm. His gallantry towards the fair sex is perfect. At an informal dinner on one occasion an American lady was in conversation with him when a certain famous German salad was offered to her. As it was handed over her right shoulder, and the Kaiser was at her left hand, she was in a sore predicament in that she did not dare to turn her face from His Majesty in order to help herself to the salad. She betrayed some natural confusion. The Kaiser took in the situation at a glance, and, looking at the lady with a smile, observed to her, 'A Kaiser can wait, but a salad cannot!' And then one day he called at the house of the Prince of Pless just about the time of luncheon, and was placed at the head of the table. But this place he gave up a few minutes later, when, seating himself between the Princess of Pless and the Duchess of Ratibor, he called out to the Prince, 'Pless, take the seat that you customarily occupy. I willingly renounce my prerogative for the pleasure of sitting between two beautiful women.'

* * *

The feverish intensity of the study and experiment in the search for the quite satisfactory aeroplane at the present time cannot be exaggerated. No scientific discovery has ever been prosecuted with greater vigour or intelligence, and there is a general feeling that we must be on the eve of a grand consummation of all this effort. Most of those connected with this work appear to have a presentiment that complete success will come at last, not through the process of gradual improvement on the machines that are now being tried, but by some grand *coup* in discovery which will at once solve entirely this tremendous problem. The inventors all the time are groping for the hidden key which for a certainty is in existence. Always they are watching and thinking of the birds, the present masters of flight. Mr Wilbur Wright once said in America that his impression of flight in its most perfect form was flight without the use of a motor, and he has always in his mind the buzzard's way of flying as his ideal. If you watch the buzzard flying, he says, you will see that under most conditions he expends exceedingly little energy. He takes advantage of the rising currents of air in order to mount aloft, and then, when he has attained a considerable height, he planes forward with outstretched wings, sometimes covering many miles before he comes near to the ground again. Then, if he wishes to go still farther, he again profits by a rising eddy of wind, and again lets himself glide downwards when the moment has come. His output of force is practically nil; he merely balances himself. The wind travels in eddies or spirals, which are cone-like in form, and on which all manner of objects are carried upwards. These currents of air are just the things that disturb the aeroplanists when they fly under present conditions, because they have to pass through them and counteract them by mechanical means. When the art is developed, Mr Wright feels sure that they will aid him rather than annoy him. It is when there is almost an absence of wind that these spirals become most pronounced. When the wind is very strong they do not take the same form, and consequently are not of the same value for lifting purposes. 'The buzzard,' says this keenest student of aeronautics, 'does not go out in high

winds. When we study the question we find that most birds remain under shelter when the wind attains anything like a considerable force, and that is why we claim that with one of our present machines, and with reasonable practice, we can remain out flying as long as the birds.' But the ultimate object is to fly better than the birds, and some of these optimistic people are telling us that at no very distant date we shall be able to buy for a hundred pounds an aeroplane that will do it.

THE HOUSE OF WHISPERS.

CHAPTER XVIII.—REVEALS THE SPY.

THE Twelfth—the glorious Twelfth—had come and gone. 'The rush to the North' had commenced from London. From Euston, St Pancras, and King's Cross the night trains for Scotland had run in triplicate, crowded by men with gun-cases and kit-bags, while gloomy old Perth station was a scene of unwonted activity each morning.

At Glencardine there was little or no grouse; therefore it was not until the partridge season opened that Sir Henry invited his usual party.

Gabrielle had been south to visit one of her girl-friends near Durham, and the week of her absence her afflicted father had spent in dark loneliness, for Flockart had gone to London, and her ladyship was away on a fortnight's visit to the Pelhams, down at New Galloway.

On the last day of August, however, Gabrielle returned, being followed a few hours later by Lady Heyburn, who had travelled up by way of Stirling and Crieff Junction, while that same night eight men forming the shooting-party arrived by the day express from the south.

The gathering was a merry one. The guests were the same who came up there each year, some of them friends of Sir Henry in the days of his brilliant career, others friends of his wife. The shooting at Glencardine was always excellent; and Stewart, wise and serious, had prophesied first-class sport.

Walter Murie was in London. While Gabrielle had been at Durham he had travelled up there, spent the night at the 'Three Tuns,' and met her next morning in that pretty wooded walk they call 'the Banks.' Devoted to her as he was, he could not bear any long separation; while she, on her part, was gratified by this attention. Not without some difficulty did she succeed in getting away from her friends to meet him, for a provincial town is not like London, and any stranger is always in the public eye. But they spent a delightful couple of hours together, strolling along the foot-path through the meadows in the direction of Finchale Priory. There were no eavesdroppers; and he, with his arm linked in hers, repeated the story of his all-conquering love.

She listened in silence, then raising her fine clear eyes to his, said, 'I know, Walter—I know that you love me. And I love you also.'

'Ah,' he sighed, 'if you would only be frank with me, dearest—if you would only be as frank with me as I am with you!'

Sadly she shook her head, but made no reply. He saw that a shadow had clouded her brow, that she still clung to her strange secret; and at length, when they retraced their steps back to the city, he reluctantly took leave of her, and half-an-hour later was speeding south again towards York and King's Cross.

The opening day of the partridge season proved bright and pleasant. The men were out early; and the ladies, a gay party, including Gabrielle, joined them at luncheon spread on a mossy bank about three miles from the castle. Several of the male guests were particularly attentive to the dainty, sweet-faced girl whose charming manner and fresh beauty attracted them. But Gabrielle's heart was with Walter always. She loved him. Yes, she told herself so a dozen times each day. And yet was not the barrier between them insurmountable? Ah, if he only knew! If he only knew!

The blind man was left alone nearly the whole of that day. His daughter had wanted to remain with him, but he would not hear of it. 'My dear child,' he had said, 'you must go out and lunch. You really must assist your mother in entertaining the people.'

'But, dear dad, I much prefer to remain with you and help you,' she protested. 'Yesterday the Professor sent you five more bronze matrices of ecclesiastical seals. We haven't yet examined them.'

'We'll do so to-night, dear,' he said. 'You go out to-day. I'll amuse myself all right. Perhaps I'll go for a little walk.'

Therefore the girl had, against her inclination, joined the luncheon-party, where foremost of all who paid her little attentions was a rather foppish young stockbroker named Girdlestone, who had been up there shooting the previous year, and had on that occasion flirted with her furiously.

During her absence her father tried to resume his knitting—an occupation which he had long ago been compelled to resort to in order to employ his time; but he soon put it down with a sigh, rose, and taking his soft brown felt-hat and stout stick, tapped his way along through the great hall and out into the park.

He felt the warmth upon his cheek as he passed slowly along, down the broad drive. 'Ah,' he murmured to himself, 'if only I could once again see

God's sunlight! If I could only see the greenery of nature and the face of my darling child!' and he sighed brokenly, and went on, his chin sunk upon his breast, a despairing, hopeless man. Surely no figure more pathetic than his could be found in the whole of Scotland. Upon him had been showered honour, great wealth, all indeed that makes life worth living, and yet, deprived of sight, he existed in that world of darkness deceived and plotted against by all about him. His gray countenance was hard and thoughtful as he passed slowly along, tapping the ground before him, for he was thinking—ever thinking—of the declaration of his French visitor. He had been betrayed. But by whom?

His thoughts were wandering back to those days when he could see—those well-remembered days when he had held the House in silence by his brilliant oratory, and when the papers next day had leading articles concerning his speeches. He recollected his time-mellowed old club in St James's Street—Boodles—of which he had been so fond. Then came his affliction. The thought of it all struck him suddenly; and, clenching his hands, he murmured some inarticulate words through his teeth. They sounded strangely like a threat. Next instant, however, he laughed bitterly to himself the dry, harsh laugh of a man into whose very soul the iron had entered.

In the distance he could hear the shots of his guests, those men who accepted his hospitality, and who among themselves agreed that he was 'a terrible bore, poor old fellow!' They came up there—with perhaps two exceptions—to eat his dinners, drink his choice wines, and shoot his birds, but begrudged him more than ten minutes or so of their company each day. In the billiard-room of an evening, as he sat upon one of the long lounges, they would perhaps deign to chat with him; but, alas! he knew that he was only as a wet blanket to his wife's guests, hence he kept himself so much to the library—his own domain.

That night he spent half-an-hour in the billiard-room in order to hear what sport they had had, but very soon escaped, and with Gabrielle returned again to the library to fulfil his promise and examine the seal-matrices which the Professor had sent.

To where they sat came bursts of boisterous laughter and of the waltz-music of the pianola in the hall, for in the shooting season the echoes of the fine mansion were awakened by the merriment of as gay a crowd as any who assembled in the Highlands.

Sir Henry heard it. The sounds jarred upon his nerves. Mirth such as theirs was debarred him for ever, and he had now become gloomy and misanthropic. He sat fingering those big oval matrices of bronze, listening to Gabrielle's voice deciphering the inscriptions, and explaining what was meant and what was possibly their history. One which Sir Henry declared to be the gem of them all bore the *manus Dei* for device, and was the seal of Archbishop Richard (1174–84). Several documents bearing impressions of this seal were, he said, preserved at Canterbury and in the British Museum, but here the actual seal itself had come to light.

With all the enthusiasm of an expert he lingered over the matrice, feeling it carefully with the tips of his fingers, and tracing the device with the nail of his forefinger. 'Splendid!' he declared. 'The lettering is a most excellent specimen of early Lombardic.' And then he gave the girl the titles of several works, which she got down from the shelves, and from which she read extracts after some careful search.

The sulphur-casts sent with the matrices she placed carefully with her father's collection, and during the remainder of the evening they were occupied in replying to several letters regarding estate matters.

At eleven o'clock she kissed her father good-night and passed out to the hall, where the pianola was still going, and where the merriment was still in full swing. For a quarter of an hour she was compelled to remain with the insipid young ass Bertie Girdlestone, a man who patronised musical comedy nightly, and afterwards supped regularly at the 'Savoy;' then she escaped at last to her room.

Exchanging her pretty gown of turquoise chiffon for an easy wrap, she took up a novel, and, switching on her green-shaded reading-lamp, sat down to enjoy a quiet hour before retiring. Quickly she became engrossed in the story, and though the stable-chimes sounded each half-hour she remained undisturbed by them.

It was half-past two before she had reached the happy *dénouement* of the book, and, closing it, she rose to take off her trinkets. Having divested herself of bracelets, rings, and necklet, she placed her hands to her ears. There was only one ear-ring; the other was missing! They were sapphires, a present from Walter on her last birthday. He had sent them to her from Yokohama, and she greatly prized them. Therefore, at risk of being seen in her dressing-gown by any of the male guests who might still be astir—for she knew they always played billiards until very late—she took off her little blue satin slippers and stole out along the corridor and down the broad staircase.

The place was in darkness; but she turned on the light, and again when she reached the hall.

She must have dropped her ear-ring in the library; of that she felt sure. Servants were so careless that, if she left it, it might easily be swept up in the morning and be lost for ever. That thought had caused her to search for it at once.

As she approached the library door she thought she heard the sound as of some one within. On her opening the door, however, all was in darkness. She laughed at her apprehension.

In an instant she touched the switch, and the place became flooded by a soft, mellow light from lamps cunningly concealed behind the bookcases against the wall. At the same moment, however, she detected a movement behind one of the bookcases against which she stood. With sudden

resolution and fearlessness, she stepped forward to ascertain its cause. Her eyes at that instant fell upon a sight which caused her to start and stand dumb with amazement. Straight before her the door of her father's safe stood open. Beside it, startled at the sudden interruption, stood a man in evening-dress, with a small electric lamp in his clenched hand. A pair of dark, evil eyes met hers in defiance—the eyes of James Flockart.

'You!' she gasped.

'Yes,' he laughed dryly. 'Don't be afraid. It's only I. But, by Jove! how very charming you look in that gown! I'd love to get a snap-shot of you just as you stand now.'

'What are you doing there, examining my father's papers?' she demanded quickly, her small hands clenched.

'My dear girl,' he replied with affected unconcern, 'that's my own business. You really ought to have been in bed long ago. It isn't discreet, you know, to be down here with me at this hour!'

'I demand to know what you are doing here!' she cried firmly.

'And, my dear little girl, I refuse to tell you,' was his decisive answer.

'Very well, then I shall alarm the house and explain to my father what I have discovered.'

(To be continued.)

BIRDS AS TRAVELLERS.

By the Hon. GLADYS GRAHAM MURRAY.

IN the whole realm of Nature there is no exact analogy to the migration of birds—'birds, joyous birds of the wandering wing.' They are the great travellers, the winged vagabonds of life; but their vagrancy is conducted on well-considered lines. Their pilgrimages are seldom uncertain; there are regular principles to guide their nomad careers, their courses being carefully chosen and lying within fairly definite areas.

The essential facts of migration are generally familiar. We know that every spring we look for the return of the swallow, the herald bird of summer, and we are sure that as autumn comes round they leave our shores again until the following spring; whilst in the autumn the fieldfares and redwings visit us, remaining throughout the winter and taking their departure

> When the cool aspen fingers of the rain
> Fell for the eyelids of the earth in spring.

All this we realise, and yet there remain many unsolved problems in connection with this wonderful subject.

We must not confound the regular migration of birds with local movements. For instance, the voyage of the sandpiper from the banks of the Tay to its winter quarters in Africa is quite a different affair from the oyster-catcher leaving our midlands for the coast-lines. Migration proper is that mysterious instinct which urges many birds to set out twice a year on a long and perilous expedition by certain well-defined routes; and we owe much to the patient researches of those naturalists who have taken up their quarters in such spots as Heligoland, the west of Denmark, and Fair Isle, over which the stream of migration passes, for most of the knowledge we possess.

Lighthouses and lightships are the best places whereon to study the subject at first hand. The Isle of May, for instance, was visited last year by two naturalists, Miss Rintoul and Miss Baxter, who made some interesting notes on the various birds which, passing that region, are attracted by the great lantern. The fact that hundreds of birds are killed by dashing themselves against the glass is a reminder that wherever the footsteps of man are traced it is often at the expense of the wilder denizens of the earth.

At St Catharine's Point, near the southern end of the Isle of Wight, there is a large lighthouse. One can readily imagine the marvellous glare of an electric light of fifteen thousand candle-power when I was informed by the keeper that the heat generated inside the lamp was so great as to melt a lump of metal as though it were a piece of wax. Here, as in most other similar places, the guardians of the lighthouse keep a schedule of all the birds that come within their observation. These records, along with specimens of the dead birds, are forwarded weekly to the Secretary of the British Ornithologists' Union, whose duty it is to study these notes and to formulate a yearly report. The lighthouse-keepers are also able to identify many birds which pass sufficiently close to be seen or heard, and others which are so exhausted that they rest on the building before proceeding on their flight.

Let us try to picture the travels of a swallow when it leaves us in the autumn, in order to gain some slight idea of what migration means. To arrive at its winter quarters in West Africa, the swallow may fly direct across the Mediterranean or by the short cut to Gibraltar, or from Italy to Malta, and so to Algeria and across the Sahara Desert; or it might follow the coast-line, and so come to Liberia and the Gold Coast, or it may choose the Nile valley, which is a great migration-route for thousands of European birds. A naturalist living in Delagoa Bay has told us how a swarm of swallows once took rest after a storm, and sat in rows on the cornice and bedstead until the morning sun beckoned them out again.

The direct Nile route is taken by many species which reach Cape Colony and the Transvaal. The kestrel, the sedge-warbler, and many other birds of naturally weak flight perform this great journey twice a year. Another route of migration extends along the coast of China directly south to the Malay Archipelago, and by this route travel many warblers; another stream of migration extends to Formosa and the Philippines; a third route trending apparently towards the Burmese countries.

Migration is not always direct from north to south or *vice versâ*. In Great Britain a great stream of migration sets in from east to west in the autumn, whilst in the Arctic regions the migration of Ross's rosy gull appears to be more from east to west. The same phenomenon occurs in the Mediterranean when an east to west migration crosses the lines of flight which extend from north to south. But on this subject of migration-routes one dare not be too dogmatic, as undoubtedly there is still much to be learnt on the matter.

The enormous elevation at which some birds fly has led a very eminent foreign naturalist, Herr Gätke, to put forward the theory that in these very high altitudes the birds meet with far less air resistance than in the lower levels, and are thus able to accomplish their journeys at a greater rate and with less fatigue. An American naturalist, Mr Scott, saw one night, through an astronomical telescope, great numbers of birds passing across the face of the moon, and computation showed that these autumn migrants were travelling at heights varying from one to two miles. Amongst the birds he saw were warblers, finches, woodpeckers, and blackbirds. At these great heights birds must be subjected to very severe cold; but the exertion of flight no doubt helps to keep up their circulation, which is always at a high pitch—the average temperature of a bird registering from 104 to 108 degrees (compared to the 98·6 of a human being).

Herr Gätke described how from 10 P.M. on the night of 28th October 1882 until the following morning the little gold-crests eddied round the lantern on Heligoland as thick as flakes in a heavy snowstorm. But given the paths, going and coming, of migratory birds, the marvellous and inexplicable question still remains: How do they so unerringly accomplish these immense journeys? Year after year the migratory cuckoo will deposit her eggs in our isles, and yet in each interval of time she will have spent a long period wandering in the heart of Africa. Sight alone can hardly be regarded as affording much aid, for, to start with, migration nearly always takes place at night. The probable reason for this is that night is not a feeding-time with the birds; whereas, if they were to migrate by day, a fast of over twenty-four hours would be entailed. Again, there is a little bird (a particular form of blue-throat) which yearly repairs from its winter home in Egypt and the valley of the Nile to the northern parts of Scandinavia, halting, it is said, only once—in Heligoland—during this great journey.

A Russian naturalist, Dr von Middendorf, is of the opinion that a migrating bird is aware of the northerly direction, and is accordingly able to steer its course; but this theory is by no means accepted by other equally competent observers. Professor Möbius put forward the hypothesis that birds performing long migrations over the sea might be guided by observing the roll of the waves. A curious point is that, as with the swallows, for instance, the young start on migration before the older birds, and among many other species the young and old journey apart. The former, therefore, can have no experience, yet they arrive safely at their destination. Doubtless many birds *do* perish in migration; but still, millions of them must make their great bi-annual journeys in perfect safety.

Amongst the migrants are many short-winged and feeble-flying birds who usually do not indulge in long flights; yet when this instinct possesses them they are capable of performing great journeys. Special attention must, therefore, be paid to the fact that migration is performed at such a height as to alter greatly the conditions of air-resistance, buoyancy, &c., owing to the rarefied condition of the atmosphere; and it is also possible that birds are assisted by selecting favouring wind-strata. Travelling at such a high level would mean an extension of the field of view; and Mr Chapman, a well-known ornithologist, worked out a rough calculation which showed that birds flying at an altitude of twenty-five thousand feet would have a tangential extent of vision of two hundred and twenty-five miles, while those flying at thirty thousand feet would have a vision of two hundred and forty-five miles. Thus, 'in the first-named altitude,' he says, 'birds would in daylight see England before leaving Norway, whilst at the higher level those crossing Spain would see Biscay before leaving Africa.' Experiments made by Mr Frank Chapman, in America, with an astronomical telescope directed towards the moon, revealed birds passing at an altitude of from one to five miles. The essential question, however, still remains as to how birds are guided in their wonderful migrations, and the old answer holds much truth when it says that 'the finger of God points the way.'

Why birds should migrate is another unsolved problem, for migration is quite distinct from distribution. Our summer visitors leave our shores in autumn, and this is no doubt partly due to the fact that the cold of winter robs them of their food-supply. As regards insects, the actual cold itself would not probably matter so much, provided there was an adequate food-supply of other kinds, for birds found dead in winter have generally died of starvation and not of cold. Doubtless our summer migrants hasten to southern latitudes to escape the winter; but why should they return to our shores

at the very time of year when there is often a great dearth of food and almost winter-like conditions to greet them, leaving behind them lands of warmth and plenty?

Frequently birds are rather premature in their arrival on our shores, for they are met with all the horrors of starvation and cold. The late Mr Seebohm described, in his travels in Siberia, the arrival of the summer migrants when that country, in spite of the time of year, was still in the grip of winter, and he told of the pitiable plight of the travellers. But each brood of birds, in turn, seems to be animated with the desire to bring forth their young in their own birthplace, so year by year 'the birds come north again' in order to mate, and reproduce their species. This latter instinct is often accounted for by the theory that the original cooling of the earth took place at the north and south poles; thus the then existing birds were forced towards the equator during the colder portion of the year; but on this subject there are many and diverse theories.

The speed of the flight of birds on migration varies greatly, as also does the length of the journey taken at a single stretch. Herr Gätke was of the opinion that the little Arctic blue-throat (a species of warbler) left Africa at dusk and arrived in Heligoland nine hours later, having travelled one thousand six hundred miles on a stretch at the miraculous velocity of one hundred and eighty miles per hour, and this little bird is only about the size of our robin. The flight of an eagle over a valley in the Pyrenees was estimated at about one hundred and forty miles per hour, that of the swallow at ninety miles per hour, and the swift's rate of travelling at double that speed, whilst some carrier-pigeons are reckoned to travel about fifty miles per hour. Pigeons have been shot in America in whose stomachs were found coffee-berries in such a fresh condition that they could not have been taken for more than four or five hours, yet the nearest part of the country known to produce these berries was some hundreds of miles distant.

The structure of birds is especially adapted for flight. Their bones are light, and in many cases contain air in place of marrow, whilst the whole build of the bird tends towards an aerial existence.

Many of the sea-birds pass all their life on the open ocean, being found at a distance of one thousand miles from land, save in the spring, when they congregate on islands in order to lay their eggs. The huge frigate or man-of-war-bird, which surpasses all other birds in power of flight, seldom visits the land, and is found in tropical seas. The storm-petrel is another wanderer of the ocean, as is the albatross. These birds spend all their lives on the high seas.

In the Arctic regions the penguins represent bird-life, but these birds have lost their power of flight, and their wings have dwindled into flippers, which are of far more use to them in their present aquatic existence.

The swallow, swift, and sand-martin journey to Africa for the winter, as do also the sandpiper, kestrel, and cuckoo, and nearly all our warblers leave us for southern latitudes. The woodcock comes to us from Scandinavia and the northern provinces, as do the redwing, fieldfare, and snow-bunting. Flocks of chaffinches come also, probably from the same country; and as these flocks were formerly supposed to be composed entirely of cocks, Linnæus christened them *Fringilla cælebs*, or the bachelor finches.

There is also a local migration, our thrushes, skylarks, and many others moving into counties and districts farther south. The quail is an interesting traveller, and last year a pair were known to breed in Haddingtonshire, their winter quarters being Asia and Africa. This species of quail must be the bird which fed the Israelites in their march across the wilderness. When with us the quail is a ground-dweller and does not essay any long-sustained flight, yet this bird wanders across seas, vast deserts, and lofty mountain-chains, and by means of the migratory instinct is most diffused over the three great continents of Europe, Asia, and Africa.

The stork spends the winter in Cape Colony and India, passing in spring into Denmark, Holland, and Germany. The nightingale, 'light-winged dryad of the trees,' passes in summer into England, Germany, Switzerland, and France from its winter quarters in the far south; but never as a rule penetrates beyond Yorkshire, and is hardly ever known to have been seen farther west than Somersetshire, though there seems no apparent reason to account for this fact. Most of our warblers and song-birds are migrants, as are also the redstart and wagtail.

Every spring brings us thousands of birds from Asia, Africa, and the Mediterranean, coming in mighty streams along their chosen routes; the main body perhaps crossing the Strait of Gibraltar, going along the east coast of Spain, up the valley of the Ebro, over the Pyrenees, and by the Bay of Biscay, till they reach Cape Finisterre, and thence flying across the Channel. France also contains three main lines of communication, the southerly stream coming up the Rhone valley to Lyons, and then crossing to the Loire valley at Orleans, and passing thence to our shores *vid* Cape La Hogue and the Start Point. Another stream comes up the Italian coast from Turkey and Greece, and through the Swiss passes into Central France; whilst others take the most northerly route through the Danube valley, passing through Zurich on to Rheims, and reaching the Channel near Boulogne and Calais. Some birds fly straight across the Mediterranean at its widest part—that is, from Algeria to Marseilles—and there hundreds of thousands of birds massed together take part in migration.

There is some parallel to migration to be found in other zoological tribes. For instance, the salmon descends to the sea after spawning in fresh-water,

and in tropical countries sometimes great journeys are undertaken by masses of insects. Swarms of locusts or ants pass over districts and leave behind them utter devastation, whilst hosts of butterflies and moths occasionally cross the Channel. There are curious little rodents, the lemmings, found in northern countries, which now and again band together in enormous numbers and rush blindly on and on until they reach the ocean, where they all perish. But with the exception of fish, none of these are proper and regular migrants. It is the birds who are the real and systematic travellers.

Following the course of the sandpiper, we find him in the month of March still in his winter quarters, which may be India, South Africa, or Australia. But when 'the spring's cool kiss is on the sod,' the instinct to migrate dominates this little bird, and before March is out he sets forth on the long and perilous voyage. From a country of tropical heat, with vegetation and climatic conditions to correspond, the sandpiper turns towards northern climes. He may take the route which skirts along the coast, passing Delagoa Bay and coming up the great Nile valley. Arriving there, he may continue westwards to Algeria, and on to the Strait of Gibraltar, there to cross into Spain, flying across the fertile plains of Andalusia, over the snow-capped passes of the Pyrenees, thence through France; crossing the Channel either from Ushant at the extreme west, or continuing to Boulogne or Calais. The different conditions of climate through which the bird must pass are great: from tropical heat, with the fierce glare of a southern sun, through more temperate regions where still the palm and the cactus grow, across the mighty ocean, until the colder shores of England are reached. Or the sandpiper might pass through the heart of Africa, crossing the mighty Sahara Desert, and from Tripoli or Algiers over the huge expanse of the Mediterranean Sea, through Turkey and Bosnia, and across the passes of the Tyrol into the valley of the Danube, and ever westwards.

The sandpiper which has passed the winter in our mighty Indian Empire journeys *vid* the Arabian Sea into Persia, and thence on to Turkey. Thousands and tens of thousands of our birds take this mighty journey twice a year, in order to lay their eggs in the woods and coppices of European countries, extending into Great Britain, Scandinavia, and Siberia. In the autumn the return journey is undertaken, and the same dangers faced anew, this time by masses of young and inexperienced birds. Some birds seem to arrive in a much more exhausted condition than others. A pipit coming in from the sea generally alights on the first field to which he comes. Larks, on the other hand, fly low and in little parties, uttering their call-notes, and appearing to suffer no distress.

Migrants usually pass straight on into the interior, but some wading-birds rest by the way to feed, and then proceed by easy stages. Other birds, again, arrive in a most exhausted condition, and thousands are snared and netted as they cross some of the passes and valleys of France and Italy. Most birds which are lost are generally the victims of severe gales, which carry them completely out of their reckonings. When true ocean-birds are found scattered inland it generally means that the weather of the Atlantic has been very violent. In the October gales of 1892, two different kinds of petrels, the eastern limit of whose ocean range is as a rule the Azores, were blown on to our coasts. The late Mr Cornish was of the opinion that birds have an instinctive knowledge that if they once surrender themselves to the force of the wind and allow themselves to drift they are lost.

Occasionally there is a curious and sudden migration of a certain species previously unknown to our shores. An instance of this was afforded by Pallas's sand-grouse, a bird which ranges from Northern China across Central Asia, and as a rule never visits Great Britain. In 1888 an incalculable number of these birds arrived, but as far as I know no reason was forthcoming to account for the circumstance.

The distinguished naturalist, the late Mr Seebohm, who was also a great traveller, during one of his visits to the Petchora River, in the north of European Russia, brought to light an interesting fact in connection with the travels of birds. In company with Mr Harvie Brown, he undertook an expedition with the object of finding the eggs and nests of half-a-dozen of our winter visitors who leave us every spring and retreat to the far north, and whose breeding-places had not been hitherto located. These birds were the gray plover, the curlew-sandpiper, the sanderling, the little stint, the knot, and Bewick's swan, all of which are winter arrivals on our coasts.

The region which Mr Seebohm visited was along the Petchora River, near to which is the mighty tundra or region of treeless swamp. This is a quite uninhabited land, and is for eight months out of the twelve covered with snow; but so great are the attractions of the tundra to thousands and tens of thousands of migrants that the pageant of their arrival Mr Seebohm described as an 'ornithological Cathay.' He furthermore revealed what the secret attraction was. At the beginning of the month of April, when Mr Seebohm arrived at Ust Zylma, three hundred miles from the Petchora River, he found that with the exception of one or two ravens there was not a bird to be seen on the tundra. As is usual in this region, summer came suddenly and swiftly, and almost simultaneously the birds arrived. The frozen river began to melt under the hot sun, and geese, swans, ducks, gulls, redstarts, wagtails, pipits, and a host more of birds (with hawks pursuing them) began to appear on this boggy moorland. For an explanation of this fact we must look to the perpetual sunshine of the short Arctic summer, which forces into maturity enormous crops of fruits, such as the cranberry, cloudberry, and crowberry. Winter, however, arrives so soon that the snow descends on these crops, and thus they are preserved perfectly fresh and pure all through the

winter until the coming spring. The fruit never decays under its covering of snow, and is accessible the moment the melting sets in. Experience has taught the birds that they will find an unlimited supply of crystallised fruits awaiting them each spring, whilst the same heat that melts the snow naturally brings forth insect life of the most prolific nature, and thus the insect-eating birds are equally provided for.

It is satisfactory to realise that a fellow-countryman, Mr Eagle Clarke of the Edinburgh Museum, is the greatest authority on the subject of migration. He hopes before long to publish a book on the subject which will doubtless throw much light on dark places, for meanwhile we have to admit that there are still many unsolved problems connected with migration.

That birds are mighty travellers we clearly see, and year by year most of us look forward with delight to the reappearance of the summer visitors to our woods and lanes. It, therefore, behoves us to accord them as much protection as we can, doing all in our power to further their increase, remembering, as the great theologian and philosopher, St Thomas Aquinas, wrote, 'Ubi aves ibi angeli.'

OF INTEREST TO TAX-PAYERS.

THE greatest objection to the income-tax assessment from the point of view of the business man is that, in the event of his being assessed on a figure in excess of his profits, he must either prepare and submit to the authorities his trading and profit and loss account, or, failing that, submit to the assessment imposed. This enactment presses very hardly on small firms and shopkeepers, who are not generally in the habit of keeping their books in such a method as readily permits of such a statement being prepared. In many cases, especially that of the professional man in a provincial town, the assessment is submitted to without demur, even although the party assessed is well aware that an appeal would end in the tax being modified. Some years ago there was published in the *Globe* a letter from a solicitor who declared that for forty years he had never paid upon less than double his real income, and at times had been forced to pay as much as three and ninepence in the pound. Being a mortgage solicitor, negotiating loans upon mortgages and other securities, it was impossible for him to appeal. He would have been obliged to show his ledgers, giving the exact returns of interest paid. This would have been equivalent to betraying the confidence of his clients, and not unnaturally he steadfastly refused.

Income-tax inquisition has become far more stringent since the days of the Boer war, and one of the greatest hardships which income-tax payers have had to suffer recently has been the rigid enforcement of the ten days' limit. Mr T. Hallett Fry, secretary of the Income-Tax Reclamation Association, quotes a case where a man was assessed for forty thousand pounds more than his actual income. Yet if he had not appealed within ten days he would have been obliged to pay upon this absurd assessment. Nominally, the time-limit is ten days; but up to a few years ago it was always extended to a fortnight or even three weeks.

Income-tax payers all over the country are bitterly complaining of the many new methods which have been devised for compelling them to increase their contributions to the Exchequer. One is to assess on profits of letting a furnished house for a few weeks while the owner is temporarily away from home. The amount received is, of course, only a small percentage of that paid by the tenant to his landlord for the use of the house unfurnished; yet over-zealous officials are pleased to call it a profit, and demand income-tax on the amount. The situation is distinctly ironical; for, first of all, they tax him for living in the house by making him pay inhabited house-duty, and then tax him for living out of it by imposing an income-tax. Clergymen, many of whom are accustomed to let their rectories in order to get a few weeks' holiday in summer, are specially hard hit by this enactment.

Another device which has been tried upon the clerical profession is the taxation of their Easter offerings. Two years ago the vicar of East Grinstead, the Rev. Douglas Blakiston, resorted to law to discover whether a sum of fifty-six pounds given to him as an Easter offering was or was not assessable to income-tax. He contended that the money was purely a voluntary contribution, and won his case. The Surveyor of Taxes appealed, and the appeal came before Mr Justice Bray. Hundreds of clergymen throughout the country awaited the decision with deep interest, and were naturally delighted when his lordship said that the money was a personal gift, and as such not assessable. He dismissed the appeal with costs.

Mr Blakiston is not the only cleric who has succeeded in taking down the income-tax authorities a peg. Just after the victory of East Grinstead's incumbent, the Rev. Henry Varley, Congregational minister at Bowes Park, requested a deduction from the assessment of the estimated rental-value of his study. An allowance is made to doctors in respect of their consulting-rooms; and Mr Varley contended that as his study was used 'wholly, inclusively, and necessarily for the purposes of his profession,' he was entitled to a similar reduction. The Enfield tax commissioners did not at first see matters eye to eye with the minister; but presently his solicitors received a letter from the Treasury solicitor stating

that the Crown did not propose to contest the case, and requesting a statement of his costs. It may be pointed out, however, that the Finance Act of 1907 now provides that where a clergyman or minister of any religious denomination pays rent for a dwelling-house and uses any part thereof mainly and substantially for the purpose of his duty as clergyman or minister, such part of the rent of the dwelling-house not exceeding one-eighth shall be treated as an expense falling to be deducted from the assessable income.

Income from investments is, of course, taxed at the source. Those whose means are so small as to exempt them from income-tax frequently find the most annoying delay when they make their claim for return of tax. In a recent case a poor clergyman, with a living worth only about a hundred a year, sent in his claim in March, yet in the following August was still waiting for his money. Of course, it is profitable for the Treasury to have the use for months of large sums which do not belong to them; but it is extremely hard that a man with an infinitesimal income should have to wait six months for the repayment of a debt due to him.

The case of the married man is certainly the hardest of all. Take that of a man with four hundred pounds a year marrying a lady with a similar income. Previous to their marriage each paid tax upon only two hundred and forty pounds, or a total tax of twenty-four pounds. As soon as they become one their incomes are assessed as one, and no exemption is allowed. Their tax is now forty pounds a year. In Germany the authorities are far more sensible. Rebates are granted to all those with children or other persons dependent on them.

The benefits of the ninepenny-tax upon earned incomes, granted last year by Mr Asquith, are largely illusory. One of the resolutions which accompanied that Budget was as follows: 'That the income-tax charged on offices or employments of profit be charged under Schedule E of the Act of 1853.' See what this means. Up to last year the lesser employés of limited companies had a right to average their income, and pay on the three years' average. Nearly one hundred thousand employés did thus average their incomes. Now they can no longer do anything of the sort. They must pay on their actual yearly earnings. So the Government takes immediate advantage of any rise in salary.

Another resolution abolished the repayment of income-tax under section 133 of the Act of 1842. Up to last year persons or firms who found at the end of their business year that their incomes had fallen below their assessed figure could make a claim for abatement or for a fresh assessment. Take the case of a shopkeeper who has been making eight hundred pounds a year for some years in succession. He is assessed as usual at eight hundred pounds. A bad year comes, and his profits drop to four hundred pounds. Against this, of course, advantage may be taken of the fact that a bad year may act to the benefit of the assessed for the following three years. The right to assess on a three years' average has always been looked upon as a privilege to traders.

Perhaps the chief defect of the income-tax as a form of raising revenue is the system of spying which it engenders. There is much more of this underhand business in existence than the average person imagines. People suspected of being better off than their returns admit are watched. If they travel first-class, news reaches the assessors. If they entertain, if they purchase horses or motors, if they build new houses or add to old ones, all these facts come to the ears of the income-tax inquisitors.

Another form of legalised plunder are the death-duties, which, since their inception in 1894, have brought the Exchequer the enormous sum of over two hundred and ten millions. That a great estate descending to one or two people only should pay a share to the State is not unjust. But it is different when the hard-won savings of a professional man have to be divided among a large family. The heirs lose, as a rule, at least a year's income. Most certainly estates up to ten thousand pounds should be exempted from death-duties, and so, too, should charitable bequests. The cruellest hardship of the death-duties is experienced when an estate descends through several hands within a very short period. In January 1908 a resident of Hull died, leaving ninety thousand pounds to a nephew. Within three weeks after the latter received the money he also died. The sum consequently became liable for death-duties twice within twenty days. When the property is a landed one the consequences of rapid succession of ownership may be very serious. There is a Herefordshire estate which has passed through the hands of four heirs within fifteen years, three of them being elderly brothers. Their nephew, who now owns the place, is forced to live in a small portion of the once splendid residence. The rest of the house is closed and going to ruin. What is worse, many hands have been turned off simply because the owner cannot by any means afford to keep them on. It will be many years before the place recovers from three consecutive payments of enormously heavy death-duties.

Local rates press upon the man of average means even more severely than imperial taxes, and here again it is the poor parson who suffers. The case of the Rev. Dr Hughes, rector of Mongewell, near Wallingford, has created a considerable sensation. When he accepted the living the rates were only about two shillings in the pound. They have within about ten years risen to six shillings and twopence. In 1907 the gross amount of these rates was about seventy pounds; and Dr Hughes, unable to meet the demands, was taken before the Caversham Bench, and a distress-warrant ordered. Mr Rose, M.P., one of the magistrates, said that the Bench was unanimous that Dr Hughes was unable

to pay. Apparently, however, it is not within the power of a magistrate, nor, we believe, of any court, to absolve a man from the payment of his rates or taxes. You may cheat your tailor with impunity; but fail to settle with the rate-collector, and you are sold up without mercy.

Judge Emden, however, took a strong stand in a case of a similar kind which came before him recently. An unfortunate working tailor had been sent to jail for non-payment of rates, and his wife appealed to have the committal order rescinded. Her husband, she said, made only twenty-five shillings a week; but they had ten children, and in consequence of the size of their family they were unable to obtain cheap rooms. They had, therefore, been obliged to take a small house, but were utterly crushed by the rates. Judge Emden said that it was a shocking thing to send a man to jail under such circumstances. He hinted that the local authorities would see that such a thing did not occur again, and complied with the wife's request by at once rescinding the committal order.

Local rates are especially unfair in their incidence. The writer has to help to pay for the lighting of one town thirteen miles away, and the very expensive drainage of another two miles off. He himself gets absolutely no advantages for his money. There are places where it would be cheaper to send their paupers to an expensive hotel rather than pay the poor-rates exacted by their union. In 1903 the county magistrates at Coventry signed a poor-rate of a shilling in the pound for the parish of Coombe Fields. In that year the contribution of this parish to the Rugby union amounted to a thousand pounds, although it had but one pauper, who cost the union five shillings a week. Stoke Newington is in a similar position to Coombe Fields. It pays something like thirty thousand pounds a year to Hackney in the shape of poor-rate, an amount which the borough declares must work out at something like two hundred pounds a head for each pauper.

The exactions of the Metropolitan Water Board have caused Londoners heartily to regret the disappearance of the old companies. In the City the increase in water-rates has been simply phenomenal. Where the New River Company charged two pounds ten shillings, the new rates vary from eight to twelve pounds. The head of one firm wrote to the papers saying that his new rate worked out at one shilling and twopence per day, though his consumption was not more than ten gallons per diem. The Bank of England found itself faced with a demand-note for three thousand pounds, and immediately employed an expert to make tests for an artesian well. Many City men refused to pay the rate, had their water cut off, and secured their office supplies from the famous Aldgate pump.

We Britons take the exactions of the tax-collector very quietly. Inhabitants of other countries are less patient. At Caudete, a town in south-east Spain, the Mayor and people gathered in the market-square and made a bonfire of their tax-papers, and when the collectors arrived stoned them from the town; while only the other day, at Toledo, Ohio (U.S.A.), a huge mob made a violent effort to lynch the treasurer, Mr Parker, because he attempted to enforce the law permitting him to charge 5 per cent. interest upon all overdue taxes.

THE MONTH: SCIENCE AND ARTS.

PHOTOGRAVURE-PRINTING IN COLOURS.

RECENTLY a remarkable new development has been successfully completed which promises to revolutionise the art of printing in photogravure. The process is three-colour; and although the inventors do not claim that the results are exact fac-simile, yet they are far in advance of anything that has yet been attempted in tricolour printing. The negatives are made direct from the original plates, but unlike colour photography, where three transparencies are prepared from three negatives taken through their respective colour-screens, and projected upon the white screen in such a manner that the three pictures become superimposed so as to form a single image, in which the thousand and one tints arising from the combination of the three primary colours are presented. In printing on paper, pigment has to be used which, to secure the same effect as in colour-photography, should be transparent. It is impossible to obtain such ink, though its opacity has been reduced to very small limits. Consequently the colour which is first imprinted upon the paper becomes to a certain extent buried beneath those superimposed, though at the same time showing sufficiently through the two upper layers of pigment as to blend therewith and supply the necessary myriad tints and tones. This is accomplished in a striking manner in these mezzogravures, which give effects that have never before been attained in colour-printing. It is the first time that chromic-photogravure by mechanical means has been achieved. To emphasise the importance and possibilities of the development, a series of pictures have been introduced to the art-world which from the printing point of view are extremely difficult to render, yet the results give a strikingly beautiful and truthful approximation of the artist's canvas. As the photogravure superseded the steel engraving, so does this new mezzochrome bid fair to outrival the first-named, especially as the publishers are enabled to

place the result of their invention upon the market at practically the same price as the ordinary monochrome photogravure proof.

PRESERVATION OF FLOWERS BY REFRIGERATION.

What may be termed the science of refrigeration is practically of recent date; but the importance to which it has arisen in our complex industrial and social life may be gathered from the fact that the first congress, which was held in Paris a few months ago, created remarkable and widespread interest, and was supported by delegates from the uttermost parts of the globe. Certainly it would seem as if the event were to become of an annual character, and such a movement should be deserving of support, seeing how vitally dependent we are becoming day by day upon cold storage. One of the latest developments in the industry is the transportation of flowers, which, picked in the bud, are preserved by refrigeration. A correspondent recently sent to us a selection of flowers which had travelled from the Cape in this manner. When unpacked they were found quite free from damage, and when placed in water and left alone they slowly awakened and came into full bloom. It appears that experiments are being made in South Africa with a view to despatching flowers in this way in bulk at the very season when they are scarce and dear in this country. The flowers undergo no deterioration from such treatment either in the beauty of their colour or longevity after immersion in water. Curiously enough, growth suspended by refrigeration appears to resume so slowly that the flowers will thrive for a considerably longer period in a room than if placed there immediately after being cut in the garden. The process would also serve to introduce to our notice many beautiful members of the horticultural family with which at present we are absolutely unfamiliar: such plants as the gorgeous iris which grows wild in luxurious profusion in South Africa or those which abound on the slopes of the Andes in South America.

HOW TO SHARPEN A RAZOR.

It is one of the misfortunes of the masculine element of the population that recourse has to be made to shaving. From motives of hygiene and health, the greater proportion, moreover, prefer to accomplish this operation themselves, but suffer from inability to impart the requisite keen edge to the instrument in order to achieve the desired end sufficiently cleanly and safely. The setting of a fine edge is distinctly a knack, and its acquisition requires as much practice as the setting of a cutting tool for the lathe. If, however, one be but familiar with the elements of the process a considerable amount of vain labour and time might be saved, as Professor M'William explained recently before the Sheffield Society of Engineers and Metallurgists in the course of a lecture on the prosaic subject, 'The Care of a Razor.' This paper embodied the results of continual personal experiments and study of the subject over a period of some twenty years. As he had only his own face upon which to test his theories, his experience has proved a valuable factor. The cutler from whom he purchased his first razor, upon inquiry as to whether it should be dipped in hot water before stropping, replied in the negative. Similarly, one recommended a rigid and another a flexible strop, according to his own predilection; while there was similar divergence of opinion as to whether stropping should be carried out before or after use. The Professor, however, tried all methods in turn, and thus was able to select that which is undoubtedly the best. He has found that the flexible strop hung at one end by a nail, such as the professional wielder of the razor ordinarily resorts to, gives a strong but not a fine edge, and that oil tends to harden the surface of the strop unless frequently applied. A sealskin strop, having a smooth, pliable surface, gives the best edge; and if the razor be dipped into hot water before stropping, the metal is toughened and better fitted for the production of the requisite keen edge. The preliminary immersion in water is a vital factor, since razors possess a finer temper than ordinary cutting tools, and are proportionately brittle. It is also expedient that the strop-surface should be preserved from the settling thereon of dust particles, the presence of which, if of a gritty nature, may break the delicate edge of the tool. It is important to remember that the edge of a razor, being obviously of a much finer character, owing to the nature of its work, than other cutting tools, must receive special attention, and by taking to heart the foregoing simple rules many of the difficulties at present experienced may be effectively overcome.

HEALING POWER OF RADIUM.

In the course of a recent lecture Sir Frederick Treves drew attention to the curative properties possessed by radium when applied to certain disfigurements to which the human body is heir, such as the port-wine stain, cists, tumours, birth-marks, and other skin growths. Such a discovery will certainly revolutionise certain phases of surgical treatment, and will decrease recourse to the knife, which at present is so greatly dreaded and often ineffective. What is required is the establishment of some fundamental principle guiding the application of the radium rays, which, as is well known, are of varying intensity or length. By prescribing which rays should be particularly used to cure certain maladies, and devising suitable scientific means to ensure the application of such, the newly founded Radium Institute of Research will accomplish valuable work. At the present time the knowledge concerning the properties of these rays in relation to surgery is scanty, and undoubtedly they are uncertain in their action, so that the cures hitherto effected have been rather the fruits of chance than the results of well-thought-out and methodical treatment. The great obstacle at present

is the fabulous price of the precious metal, the instruments used for such operations costing from two hundred and fifty to five hundred pounds. Again, it has yet to be ascertained whether the rays, in curing a malady, may not provoke a situation in which the remedy proves worse than the disease. The terrible scourge of dermatitis in Röntgen ray application is a potent illustration of this possibility, and is one of the results attending dipping into the unknown. This eventuality can only be fathomed by recourse to prolonged research by accomplished scientists such as have been enrolled for the committee of the new Radium Institute.

NON-ACTINIC CLOTHING FOR TROPICAL USE.

Some twelve months ago, in referring to a lecture delivered by Colonel Maude, late R.E., relative to the use of red garments in tropical countries to avoid the disturbance of the human body caused by the sun's actinic rays, we mooted the idea that clothing of this kind might very profitably be specially manufactured for use in such countries. Two enterprising firms in these islands have acted upon our suggestion, one in regard to cloth for outer garments, known as 'solaro,' which we have already described, and the other for underwear. This latter has only recently been placed on the market, but its preparation has involved continuous expensive experiments and research during the past twelve months. The new fabric, which is suitable for all descriptions of undergarments, is made in accordance with established scientific principles. It is built up of threads alternately red and orange; but the pronounced appearance is red, the two colours thus combined providing an ingenious, highly efficient medium for absorbing the pernicious actinic rays. The colour selected is that which has been scientifically determined as being the most capable of fulfilling the desired purpose. It is not bluish, but is a specially evolved red. The combination of the two tints is so effectively accomplished that the non-actinic rays that pass through exercise no harmful effects upon the body whatever. Moreover, the material being made of a porous character, in accordance with the well-established cellular principles so successfully adopted in aertex clothing, the skin receives adequate ventilation. The result is that, although the actinic rays are arrested in their path, the pores of the skin have access to the air through the cells in the fabric; so that, although one may be industriously working in a sweltering sun, no discomfort is experienced. The red guarantees protection against sunstroke; and although one may be perspiring freely as a result of physical exertion, all danger of catching a chill is averted, since the material, as is well known, ensures protection against this danger owing to its peculiar construction. In selecting the desired colour, however, care had to be exercised that it stood absolutely fast under all conditions. This proved a matter of great difficulty at first, but has now been completely overcome. It will not fade with the sun, while the dye does not run when washed, no matter what kind of water may be used. The material has been subjected to searching trial in tropical countries such as Cuba and Central America, and has proved eminently efficient and durable.

PAPER FROM COCOA-NUT HUSKS.

The rapid depletion of the forests of the world, due to the increasing use of wood-pulp for the manufacture of paper, is producing a critical position in that industry. Already in the United States the timber supplies have fallen short of the demand. Paper is rising in price, and in order to cope with the situation applied chemistry is searching keenly for a substitute. Experiments are being made by the Government with a view to discovering commercially practicable methods of manufacturing paper from peat, straw, cotton-stalks, and other similar waste products which exist in illimitable quantities. In this country the problem has not yet reached an acute stage; but paper-manufacturers, seeing the prospects of a paper-famine looming in the distance owing to the exhaustion of forests, are embarking upon similar chemical experiments. Among the various wastes being examined in this connection, one firm—Messrs J. Brown & Co., Penicuik, makers of the paper upon which this *Journal* is printed—have examined cocoa-nut husks at the request of one of our correspondents, and the results of their practical experiments in this direction are interesting. The outer rind of this husk is of a very lignified character. Inside this rind is a pithy structure about two inches in thickness, interlaced throughout with very strong, long fibres of a jute-like, lignified appearance. In the boiling treatment of the husks two large samples of the selected material were dried at a temperature of one hundred degrees Centigrade, and then accurately weighed. The outer rind of the one was then pulverised, and the other left in its original condition. Each sample was then placed in a separate bag made of hessian cloth, and boiled for four hours at a pressure of thirty pounds per square inch, with eighteen pounds of sodium oxide per hundredweight, in esparto boilers along with the esparto grass. The boiling operation completed, the husks were examined, and it was then ascertained that this treatment was not sufficiently drastic to destroy the pithy constituent in the rind, while the latter was scarcely affected or softened by the boiling. These results proved that to separate the cellulose from the non-cellulose portions of cocoa-nut husks much higher temperatures and pressures would be required. The sample of cocoa-nut husk in which the rind was broken up was resolved to a greater extent than that left untouched. Further experiments were, therefore, carried out with the former bulk. It was treated with thirty-six pounds of bleaching-powder per hundredweight; but even with this excessive pro-

portion of bleaching agent (which is about four times that required to impart a pure white colour to esparto) the husk was but slightly whitened, which is another proof that the boiling process was not sufficiently prolonged or severe. To prepare a suitable paper-making material from such a waste as cocoa-nut husk is obviously very difficult, if not impossible, but laboratory experiments are to be continued with a view to giving the material a further chance.

MOVING PICTURES IN COLOURS.

During the past few months considerable interest has been created in photographic circles by the announced discovery of methods of taking and projecting animated pictures in colours. The inventions, however, when analysed are all carried out upon the same lines. This is the taking of the negative in triplicate through colour screens of red, blue, and green respectively, the latter being in the form of three equal-sized sectors on a glass disc rotated before the lens during exposure. Projection is carried out upon the same lines. Such is really an application of the Ives chromo-photographic system, which, when applied to kinematography, is unsatisfactory. An English inventor experimented with this same system as far back as 1898, but abandoned it for research upon new and original lines, which have now proved eminently successful. Curiously enough, this inventor was the first to apply the zoetrope to photography, for in 1885 he devised a camera in which by the simple turning of a handle he secured photographs in such rapid succession upon a glass plate that when they were projected in a similar manner upon the screen a life-like motion was obtained. When Mr Friese-Greene exhibited this apparatus which he had evolved it created considerable interest, and there is no doubt but that his latest device for producing the same animation in colours will compel equally widespread attention. The idea is so simple that it cannot fail to prove commercially possible. Instead of taking each picture respectively through the three-colour screens, only one picture is taken through each screen, the latter being disposed in successive groups of three upon an endless celluloid band, which, as the sensitised film is exposed, has one filter brought into juxtaposition with the sensitised surface. In other words, he does not require to prepare three negatives of each picture. The camera is in duplicate, the lenses being disposed side by side in the same manner as the eyes are set in the head. Both lenses are fitted with colour filter-bands which work together. The two exposures however, are not made simultaneously, but alternately; and, similarly, when a photograph is taken through the red filter in one camera it is followed by the blue screen in the second camera. This in turn is followed by the green in the first camera, and then by the red in the second camera. The blue then comes before the lens in the first camera, and then the green in the second camera, this system being continued during the time exposures are being made. By the special shutter-arrangement devised, the working is such that the successive filters of the two cameras become dissolved or blended into one another. In projection the same principle is followed. There are two lenses placed side by side, the pictures from which become exactly superimposed upon the screen in exactly the same manner as the two pictures recorded by the eye become resolved into one in the brain. When the projector is set in motion the colour images thrown from each become blended on the screen, so that, in accordance with the law of visual persistence, the eye receives an impression of a perfect three-colour picture. Moreover, the picture is stereoscopic—an equally striking result. Mr Friese-Greene has made the most important stride in colour-photography, at any rate so far as kinematography is concerned, that has yet been attained.

INGENIOUS AND ECONOMICAL HOUSE-WARMING SYSTEM.

An ingenious invention for reducing the loss of heat in the coal-fire and incidentally providing means of heating other rooms at the same time has been perfected. The familiar grate is preserved intact; but at the back is a small boiler of the arched type, under which the waste heat passes on its escape up the chimney, but in its flight is compelled to perform some useful office in heating the water within the boiler. The grate is fitted with flues, and as desired the waste heat can be deflected either beneath the boiler or straight up the chimney by means of two small dampers. From the boiler extends a small pipe connecting with radiators placed in adjoining rooms either on the same floor or the story above as required; and, consequently, as the temperature of the water within the boiler rises, the water flows to the radiators, where it sheds its heat into the rooms. By this means, although a fire is burning in one apartment it can be controlled to heat two or three other rooms equally well. It is a very ingenious device, and so simply designed that it cannot get out of order. No alteration in the fire-grate space is necessary, while the boiler is detached from the grate proper and can be removed whenever desired, as it is not a fixture. All that is necessary in withdrawing the boiler is to uncouple the pipe extending therefrom to the radiators—a very easy operation. The system marks a new departure in house-warming arrangements which, when its benefits and economics are realised, is certain of wide popularity.

A TIME-SAVING DEVICE IN CROCHET-WORK.

A novel and natty little device which should appeal to all those participating in crochet, knitting, or allied crafts, either for personal diversion or teaching purposes, is a handy recorder which has made its appearance. It is made of cardboard, measures about seven inches long by three wide, and works upon the familiar metric system.

On the right is a dial registering from 1 to 19 inclusive, with the number desired showing through a small aperture. In the centre is a pointer indicating tens, from 2 to 9 inclusive, while on the left is another dial similar to the first registering from 100 to 1000 and upwards. In teaching a class or working from a new design the recorder will be found indispensable, since all counting and measuring is avoided. It is useful for all kinds of artistic needlework, whether done in rows, rounds, or sections, and has the advantage of being set instantly. Often one has suffered from having to abandon a piece of work when it was only partially completed, and not being able to resume the occupation for weeks or perhaps months after. Then valuable time is lost in picking up the sequence of the pattern once more. By means of this time-saving recorder, however, when compelled to forgo the work one simply sets the recorder to the point at which it has been left; consequently, when operations are resumed the situation can be immediately ascertained by consulting the recorder.

STICK LIQUORICE.

In his report on the agriculture of Southern Italy, the late Consul-General E. Neville-Rolfe draws attention to the diminishing exports of stick liquorice to the United Kingdom. He states: 'As a commercial asset, liquorice is much less important than it was even such a short time as ten years ago.' After describing how stick liquorice is made from the strained and evaporated solution obtained from boiling the pulp of the crushed and ground roots, he adds: 'These [sticks] are made into three sizes, the largest being that most in demand for the English market, and the smaller for Scotland and Ireland. It is used as a remedy for coughs and colds, and to conceal the taste of disagreeable medicines. Modern discoveries which have made ordinary drugs less nauseous than they used to be have caused a decline in the demand for the liquorice for this purpose.' Unfortunately this change has brought evil as well as good in its train; drugs otherwise nauseous, having been made palatable by sugar-coating, are too often ignorantly self-administered. It may be added that as the habit of chewing tobacco has declined, less liquorice-stick (a long-recognised chewing-tobacco ingredient) is used in conjunction therewith; also, that certain chemical processes have superseded its former use for colouring various iron and steel preparations. Dr Keith, in his *Plea for a Simpler Life* and *Fads of an Old Physician*, recommends liquorice as a cure for indigestion. When pure liquorice can be had, such as is supplied to the wholesale confectioner, that seems most effectual.

SHERWOOD FOREST.

Most visitors to the Midlands know something of Sherwood Forest and the neighbourhood of the 'Dukeries,' which includes Welbeck Abbey, a seat of the Duke of Portland; Clumber, associated with the Clinton family; Haughton, with the Dukes of Newcastle; Thoresby, the seat of Earl Manvers; and Rufford Abbey, a seat of the Saviles, visited by the King. Mr Joseph Rodgers has gathered the associations and much of the romance and beauty of this interesting district into a finely illustrated volume entitled *Sherwood Forest, with an Account of some Eminent People who Resided there* (T. Fisher Unwin). This renowned forest, associated with the name of that bold outlaw Robin Hood and his merry men, once stretched between Nottingham and Whitby. Now the woodland, with its fine old oaks, has shrunk to a fragment of its former size, to which the smoke and sulphur from coal-pits threaten to be prejudicial. Mr Rodgers expatiates on the restful feeling of happiness which is derived from the contemplation of the beauties of nature, one of the choicest blessings of existence, and the fact that woodland scenery from the remotest times has impressed itself on the imagination of mankind. Sherwood is the scene of Tennyson's *Foresters*. Scott and Washington Irving had a healthy belief in the existence of such a personality as Robin Hood not entirely shared by later writers. The Major Oak, or Queen Oak, can accommodate some twelve people in the hospitable hollow of its trunk, and seven villagers from Edwinstowe once took breakfast comfortably there. Another famous oak, quite a shell when we saw it, is called Robin Hood's Larder. Newstead Abbey, associated with Lord Byron, lies between Mansfield and Nottingham. Let intending visitors provide themselves, however, with a card of admission, not to be had at the gateway, else they may find the gates barred to their entrance if they are birds of passage.

THE FIELDS AT HOME.

To eyes that long have ached with tropic glare
The sight of our green fields brings restful balm,
And soothes us like some old-remembered psalm,
Heard as a child, when all the earth was fair.
Talk not to me of blossoms rich and rare,
Or the rank luxury of graceful palm
In endless sunshine and eternal calm,
While the green fields of home may be my share!
Give me the sunbeams, chasing o'er the grass,
The happy hedges in their green array,
Like little children loose on holiday.
So let my mem'ry of the tropics pass!
The lodestone that attracts all men who roam
Is the dear thought of the green fields at home.

THE SEQUEL OF A TRAGEDY.

By T. W. SPEIGHT.

IN TWO PARTS.—PART I.

ON a certain sunny September afternoon, Frank Basildon and his brother-in-law, George Northfield—the latter and his wife over on a visit from New Zealand—were lounging in wicker chairs on the veranda of the old mansion of Nethercroft. Between them was a small table, on which were cigars, cigarettes, and sundry seasonable drinks. Both were smoking, and listening (or seeming to do so) to the mellowed strains which reached them from the drawing-room, where their wives were trying over some new music which Mrs Basildon had received that morning from London.

After a rather long spell of silence Northfield said abruptly, 'What's the name, Frank, of the blue-black stone in that big signet-ring on the middle-finger of your left hand?'

'It's a lapis-lazuli, and is engraved with the Basildon crest. The ring belonged to my great-grandfather, and was last worn by him. How it came into my possession is a story worth telling. Should the recital of it serve to waft you into dreamland this slumberous afternoon I promise freely to forgive you.'

'When my great-grandfather, Colonel Basildon, who had fought with distinction under Wellington in the Peninsula, came to Nethercroft to eke out the remainder of his days in what for him was an existence of penury and obscurity, he was, so to speak, a ruined man. He had started in life as the owner of a fine estate in Devon, with upwards of twenty thousand pounds in funded property. But it was an era of high play, and after his retirement from the army he plunged to such an extent that five short years saw him at the end of his tether. There was no entail, and he had made a clean sweep of everything he could gamble away, including the fortune brought him by the heiress he had married. Nothing remained save this old mansion and its couple of hundred acres of mixed meadow and moorland, which had come to him through his wife, but was strictly settled on their only son.

'After the colonel's death—or, rather, after his disappearance, about which you shall hear presently—Nethercroft was let on a lease, which was renewed from time to time; but when I succeeded to the little estate—it was all my father had to leave—a caretaker and his wife were, and had been for some years, the house's sole occupants.

'At that time, as you are aware, I was a struggling painter, earning just enough to enable me to keep my head above water, but not enough for two. I had lately fallen in love with your sister, had proposed, and had been accepted; but there seemed little likelihood of our being able to wed for a long while to come.

'My father died in the winter, and in the following May I came down here for the first time. I was a landowner in a very small way, and felt it incumbent upon me to visit the property. I had written beforehand to John Fildew, the caretaker, and he had fitted up a couple of rooms in homely fashion in readiness for my arrival. I was minded to become my own tenant for the next few months, and more especially so when I had explored the neighbourhood and had discovered how rich it was in picturesque "bits" on which I could exercise my pencil or brush during the coming summer. My wants were few and simple, and I did not wish for a better cook than Mrs Fildew.

'You have been here so short a while that I don't think you have yet found your way to the edge of the cliff overlooking the sea, although a twenty minutes' walk would take you to it?'

'That's so,' replied Northfield; 'but I've lots of time before me.'

'We will go there to-morrow, because I have something to show you. A considerable stretch of the ground which gradually rises from Nethercroft

[All Rights Reserved.]

to the summit is included in my small estate. I had not been here many days before, in one of my perambulations, I came upon a narrow cleft or fissure in the cliff close to the highest point. It was only about a couple of feet wide, but of unknown depth. It began about a dozen feet back from the face of the cliff, and extended landward for about a score yards.

'Later on, when summer was merging into autumn, there came a morning when, on making my way to the summit of the cliff, as I often did for an after-breakfast breather, I was amazed by the discovery that the fissure, instead of being only two feet in width, as I had seen it a couple of days before, was now nearly six feet from edge to edge. At the time I was utterly at a loss to know to what to attribute so remarkable a disturbance; but next day the newspapers informed me that a slight seismic shock which extended nearly half-way across England had been experienced a couple of nights before, and I could only conclude that to it the widening of the fissure was due.

'It was a still morning; and as I stood there, peering into its depths, a faint, hoarse murmur reached my ears. Going down on one knee, I bent my head and listened. I now heard the murmur more distinctly, and recognised it for what it was—the plaint of the incoming tide as it broke on the beach at the foot of the cliff. But if its inarticulate voice ascended to me so clearly when I bent my ear to the cleft, there must be a hollow or opening of some kind far below in which the sound was first gathered up. Thus I reasoned, and the longer I listened the more convinced I felt that such must be the case.

'Next day I took John Fildew with me up the cliff. With him he carried a rope, to one end of which a weight was attached. On reaching the cleft I dropped the weight over the edge and gradually paid out the rope till it pulled no longer, and then I knew that the weight had reached the bottom. When the rope was drawn up and measured, I found that a length of close upon eighty feet had been paid out.

'A few days later saw John and me again on the cliff. This time we had come laden with a rope-ladder which I had ordered from London, together with a stout sapling to be laid across the rift. It did not take long to lower the ladder, which was heavily weighted, till we felt it touch the bottom, and then to secure the other end to the sapling. All was now ready for my descent. John was much perturbed, and would fain have dissuaded me from the adventure; but I scouted his fears, and laughed up in his face as I disappeared from view.

'Down I went, slowly and carefully. The lower I got the narrower the fissure seemed to become as I stared upwards; but the day was a bright one, and overhead was a stretch of sunlit sky. The walls of the fissure, so far as I could judge, consisted of a hard conglomerate of pebbles and sand.

'At length I stepped off the last rung of the ladder on to the sandy floor of a cavern of considerable size, which was flooded with a sort of bluish-green twilight, derived in part from the opening seaward where the lip of the cliff hung down to within a few feet of high-water.

'Suspended from the belt of my Norfolk jacket was an electric dark-lantern, which I now unslung and opened the slide; but scarcely had I turned and thrown the rays of my lantern into the recesses of the cavern before a tremor ran through my nerves, and an exclamation of horror and amazement broke from my lips. On the ground a few yards away lay the skeleton of a full-grown person. Seen by that artificial light, it looked nearly snow-white. Close by it were four boxes or sea-chests, the smallest of them being on the top of the others. After a long, silent stare, I drew near the skeleton and peered down at it. Its component parts lay somewhat scattered from each other and in no sort of order. Presently my attention was attracted by some small glittering objects which lay among the bones. I stooped and picked up three of them. They proved to be metal coat-buttons of a bygone era, and still showed traces of their original gilding. The next article I picked up was the lapis-lazuli ring I am now wearing. When I turned the stone to the light and saw that it was engraved with the Basildon crest a sudden vertigo overcame me. I sat down on the nearest chest and stared at the ring like one fascinated. It seemed to me that I had accidentally lighted on the clue to an old family mystery. Upwards of eighty years before my great-grandfather had mysteriously disappeared, and had never been heard of again. Had the secret of his fate been revealed to me after all this length of time? I could hardly doubt it.

'It will give you some notion of the sort of estimation in which my great-grandfather was held in these parts,' resumed Frank presently, 'when I tell you that he was commonly spoken of either as "The Black Squire" or as "Black Basildon;" and, from what I can gather, he succeeded in making himself thoroughly hated by all whom he looked upon as his social inferiors. As a magistrate he was notoriously the most severe of any who sat on the bench at Cleeve End. Poachers in especial had good reason to dread being brought before him. His limited estate held nothing in the way of game save rabbits, but these he did his best to preserve as if they were so many pheasants. He acted as his own keeper, and thus it fell out that one night he encountered a couple of poachers on his property. In the skirmish that ensued he shot one of them dead, while the other was subsequently captured and transported to Botany Bay. Within a month of the affair a couple of attempts were made on his life as he was returning in the dusk of evening from Cleeve End, after which he never left home without carrying a brace of pistols. He had the reputation of being a dead-shot.

'At this time he had been a widower for a number of years, and it was characteristic of him that he

should have quarrelled with his only son, a subaltern in the army, whose pay was supplemented by an income of a few hundreds a year bequeathed him by his mother. Such was the state of affairs when Colonel Basildon, at the age of fifty-five, brought a second wife home to Nethercroft on his return from one of his occasional visits to the Metropolis. No information was vouchsafed by him to anybody with reference to his bride's family or antecedents, and nothing about them ever came to light. She has been described by one whose position enabled him to see much of her as being a red-and-white, feather-brained beauty of twenty summers, vain and selfish, with a perpetual craving for change and excitement. What but a disastrous result of some sort could be looked for from the marriage of such a being to the dour master of Nethercroft?

'About three miles away is Pearmount, the home of the Caslins, an old county family. Young Mrs Basildon had not been wedded a year before it began to be whispered among those who were in a position to observe such things that she and Hugh Caslin, the heir of Pearmount, were often to be seen together when the Black Squire was away attending to his magisterial duties; but no whisper of the state of affairs seems ever to have reached the man most concerned. He was too thoroughly hated for any one to care to enlighten him; and most likely those who knew and talked about what was happening under their eyes gloated over his ignorance, and told each other that, whatever the outcome might be, he would be rightly served.

'At length the crisis came. Young Caslin and Mrs Basildon were missing, and were reported to have taken with them the casket containing jewels, valued at from fifteen to twenty thousand pounds, which had been the property of the first Mrs Basildon, and were left so that her husband was debarred from disposing of them. At any rate, the casket had disappeared.

'Of the steps, if any, taken by the colonel to trace the runaway couple I have no knowledge; but the singular fact remains that on the fifth day after their flight he himself mysteriously disappeared, and was never heard of afterwards.

'You may possibly wonder how it happens that I am in a position to speak with so much confidence about events which occurred long before I was born. That, however, is easily explained. My information came to me from John Fildew, and to him from his father, who lived to be ninety-eight, and had been the colonel's body-servant.

'And now, if you please, we will go back to the cavern and what I found there.

'As soon as I had recovered in some measure from the shock of my discovery I began to make a careful examination of my surroundings. I have already mentioned that the smallest of the chests had been placed on the top of the others, and on it I now perceived certain articles which I at once proceeded to take up and examine. The first that I picked up was a much-tarnished, old-fashioned gold repeater, with a fob-chain attached. I pressed the spring and the case flew open. It was not without a thrill that I read the name engraved inside: "Archibald Seymour Basildon." All doubt was ended. The poor relics of humanity on the floor could, indeed, be none other than those of my great-grandfather. I laid down the watch and chain, and took up the next article, which was a massive gold pencil-case. The third and last article was a mildewed russia leather pocket-book, which proved to contain nothing save a rather bulky memorandum-book, the leaves of which were covered with close writing in pencil. A passage here and there which I glanced at decided me to leave the cavern by the way I had entered, take with me the pocket-book, and as soon as I reached home to read carefully from beginning to end what was there written. Everything else should be left till another day.

'A few minutes later I had rejoined John Fildew on the summit of the cliff. The old fellow was intensely interested when told of my discovery. I bound him to secrecy, and made an arrangement with him for next day.

'And now I'll fetch the pocket-book found by me in the cavern, and read to you what is written inside.'

(To be continued.)

AN IMPRESSION OF CANADA.

By JAMES MILNE, Editor of the *Book Monthly*.

HAVE you ever noticed that the great book of Nature, like the small books which we all write, seems to have a preface, an introduction, something leading gradually and naturally to something bigger? You have the scattered trees before you get a wood, and the wood before you get a forest. Similarly, you have the foothills before you get to the hills, and the hills before you get to the mountains. It is still more interesting to notice this natural transition of things as between sea and land; and in going to Canada one cannot help not merely noticing but feeling it.

The whole voyage across the North Atlantic is, as it were, a preparation for the country which you are to find when you get there. You sail out from Liverpool—say in the Canadian Pacific liner *Empress of Ireland*, as I did—and soon you are in the long, silent atmosphere of great waters. You tack north and then across, and all the time there is this wonderful feeling of space and vastness—an

endless expanse of sky and moving sea. You feel that you have suddenly been carried from the busy haunts of men into the solitudes of Mother Nature; for, after all, Nature is perhaps most imposing in the mirror of the sea. At first the Atlantic looks as if it were always the same, apart from whether its face be rough or smooth; but soon you learn that it has a thousand moods, and feel the effect of these. The supreme feeling you have is that you are in a world, if it be only a world of salt-water, where everything is fresh, pure, virgin.

Now, you still keep that impression when you have sighted the shores, it will be, of lonely Labrador if your voyage is in the summer, and the Strait of Belle Isle. Those long, gray, rugged, scarred shores appear as if they had never been trodden by the foot of man, as if they would always remain next-door neighbours to the Arctic regions, and as if mere man were really powerless to intervene. So you pass into the Gulf of St Lawrence, and then into the mighty St Lawrence river itself, and still the wonder grows on you about this newness, this freshness, this sweetness of heaven and earth and sea. It has come to you gradually, as we have seen; but when you think for a moment you realise how very much Canada takes her 'note' from the seas which wash her eastern shores and from the fresh-waters which pour through her territories as the St Lawrence does.

It is a delight to sail up the St Lawrence on a sunny day, with the trees green on its banks, fishermen's houses dotting those banks, and the Laurentian Hills lifting their cone-shaped tops into the blue sky. The image which suggests itself to your mind is that of a new land blushing to the dawn. And then the wind is so rich and sweet, as if it came from the very North Pole—which, indeed, it may happen to do, merely stopping by the way to pick up the fragrance of the clover and the thousand flowers that the hot, quick summer of Canada throws up, a beautiful robe to adorn the face of the land. Does all this make it clear that the first impression which one has of Canada is as of a country which man has had little time to change from the condition in which Nature left it, but which, at the same time, is a very fruitful home to him? That, anyhow, was the first impression which Canada gave me, and I took it away, qualified here and there by lesser pictures set in the great one; as, for instance, of Quebec on the rocks above the St Lawrence, a city of romance, a patch of Old France on the shores of the New World.

It was in summer weather that I made the acquaintance of Quebec, and it was radiant in sunlight and brisk of atmosphere. There was something about it, and its lift into the sky, which suggested Edinburgh—the view and the feeling you have when you look over the Castle ramparts down towards Granton and the Firth of Forth. In fact, when I stood on the topmost part of the Citadel of Quebec, and looked at the waters of the St Lawrence flowing below me, I could almost have felt that I was on the ramparts of Edinburgh Castle, only with a difference. Edinburgh usually has a clear sky, partly, perhaps, because she often also has an east wind; but Quebec has a clear sky without an east wind. It is wonderful how far you can see in that Canadian atmosphere, and how far a cry will carry in it, which is sure evidence of its purity and rarity. No wonder that it was a sore thing for Old France to have Quebec wrenched from her, because Old France, with her many faults, was romantic in outlook, had a natural affinity for romance.

To-day the French-Canadians of Quebec are grateful for the history and the traditions which Old France has left them, and still more grateful for the progress and the practical comfort of life which the British Empire has given them. They would not willingly step outside the British Empire; but, on the other hand, they cling to their language and religion and to the laws which Old France made in New France long years ago—they cling to all these things as the members of a family cling to the family traditions; and why should it be otherwise? You will probably meet many tourist Americans during your sojourn in Canada, and they will speak impatiently of the French-Canadians, saying they are slow-moving, slow-thinking, and unprogressive. Perhaps it is so; but you like the French-Canadians for these very characteristics, and you would not wish them to be guilty of that perpetual rush and scramble which makes America such a whirlwind to live in, and which is gradually infecting the neighbouring parts of Canada.

There can be no doubt that the characteristics of America are making themselves felt, as indeed was inevitable, in the near-by Dominion of Canada, and this is particularly noticeable in a city like Toronto. Most French-Canadians, when they go to America for a while, return to Canada brisker, more go-ahead, more progressive; but, even so, the mass of French-Canadian life is little affected, and it runs on in its quiet, simple, old-world way, 'contented wi' little and cantie wi' mair,' as Robert Burns says. They are a very engaging people the French-Canadians, and they have kept alive in the New World some of the more gracious characteristics and traditions of the Old. They take time to live, to enjoy themselves, and they have a delight in what one may call the artistic side of life. They are fond of music, and the native-made statues which they have put up to notable French-Canadians show that they have in them the making of a French-Canadian art. They already have a French-Canadian literature, which, if its bounds be limited, is nevertheless full of real colour and of no little vitality.

There will, perhaps, be a leap forward in all these things when the bond between the Roman Catholic Church and the French-Canadians gets a little easier, becomes less taut, and allows greater freedom to the individual in thought and, one may

even say, in action. Nowhere, not in Rome itself, is the Roman Catholic Church more powerful than in Quebec and French-Canada. If it does not rule in name, it rules in fact, and nobody need doubt that it seeks to rule its people for their good. On the other hand, one may doubt whether we live in an age when it is possible for any ecclesiastical authority to do that, because nowadays no single Church stands for the many-footed march forward of the world to ever higher things. You are struck, the first hour you are in Quebec, with the air of ecclesiasticism which is about it, and with the presence of monasteries and Roman Catholic churches and priests and nuns. Here, indeed, is the Old World set on the shores of the New, and certainly it captivates your imagination. Your mind runs over the gallant story of New France, its discovery by Jacques Cartier, its creation by Champlain, its government and misgovernment by successive orders of French nobles, until finally we come to the Plains of Abraham up there, where Wolfe and Montcalm, both choicely fine spirits, gave their lives for the New Canada which was to begin its life when they died.

Quebec is the oldest city in North America, for it was before New York, and it remains in many ways what it was, while New York has become a great cosmopolitan place which has lost its past in its present. Quebec, therefore, has a sentimental interest for a traveller from the Old World, because it seems to welcome him to an atmosphere with which history on the European side of the Atlantic has made him very familiar. This you find in French-Canada generally, a survival of an Old Worldism which may have its defects, but which also has an agreeable picturesqueness, a charm as of the days of ruffles and duels and gallant doings. They may not, in reality, have been very good those 'good old days;' but we colour them in our imaginations to make them seem good, and that is what French-Canada does in reference to her own young years. It is possible that the early French-Canadians were neither particularly happy nor particularly prosperous; but there they were, with the cross in one hand and the sword in the other, facing barbarous peoples, gathering a new world into civilisation, and that is a striking picture which French-Canada does well to treasure in its memory.

When you speak of French-Canada you include the province of Quebec as well as the city of Quebec, and you include half the population of the great city of Montreal. You may say of it that it speaks French on one side of the street and English on the other, and that the acquaintanceship between the two races is indicated by a cry across the street. They are co-partners rather than co-operators in the undertaking of Canada; they lead their distinctive lives, finding their labours and their pleasures within their own respective gates, and rarely giving each other hostages in marriage or in anything else. Yes, there are two peoples in Canada, two gifted peoples, each with its own qualities—the British for nation-making, practical effort, driving the ford and bridging the road; the French for—shall we say?—the more decorative side of life. You can perceive that eventually, when the two classes of gifts are merged in a fused race you will have a people potent of things which even Canada, in her dreams of the future, has not yet dreamt about. But that song of unity is still 'over the hills and far away,' and it is only those who listen with their hands to their ear who hear it. It is the 'still, small voice' crying in the wilderness, but perhaps it grows in volume, and perhaps the day will come when it will be heard on the hill-tops instead of being merely an echo in the valleys beyond. There are people in Canada who are working for this, thinking for this, and who, in its realisation, see the perfect triumph of a Canada whose millions will fairly divide the New World with America. As yet Canada is spacious in acres, rich in natural wealth, but comparatively small in population. You can see, however, and you can feel, that she is only half-grown up, and not even that. Full manhood is still hers to come. She has possibilities everywhere, not merely of money-making, which is a poor business after all, but of happiness, which surely is the higher aim of life.

The Canadians are a happy, hopeful people, and for that possibly they have to thank their climate as well as their country. They have much oxygen and endless blue skies, and you will meet Canadians who will tell you June in Canada is not so good as December, when the land is fast in snow and the air is crisp with life. In any case, it is an atmosphere full of life-making and of the vigour and the achievement which come of all this. And because the Canadians are a happy people, it follows that they are a sociable people, kindly, genial, hospitable. They are always glad to meet somebody from the Old Country, and to hear about that land from which they sprang, even if they themselves have never seen it and never may see it. They sing, in the words of a French-Canadian poet, 'Oh Canada, beloved Motherland!' but next in their heart is the older motherland across the Atlantic. Their attitude to their motherland Canada, and to their grandmotherland Britain, may be put as that of a man to his wife and to his mother; he would find it hard to choose between them if he had to make the choice. They are often impatient with us, those young, robust Canadians, saying why don't we do this? and why don't we do that? forgetting that an old country cannot change and turn things about with the rapidity with which you can fashion a new country. They will say to you, 'Look at the narrow streets you have in London and in Edinburgh,' and you need to remind them that those streets were there when they were thought to be excellent thoroughfares, centuries ago. Deep down in their hearts they would be distressed, when they came here, to miss those narrow London and Edinburgh streets—London and Edinburgh would not

then have the same interest of contrast or attachment for them.

Speaking of Canada, one speaks of London and Edinburgh almost as equal capitals, because wherever you go in the Dominion you meet Scotsmen, and always the inquiry is about the 'North Countree.' Canada has largely been developed by Scotsmen, and in no other colony does a young Scotsman get a better welcome. I was talking one day to the secretary of a great Canadian bank, and I happened to ask him if he often recruited his staff from home, because Canadians always speak of the Old Country as 'home.' 'No,' he said, 'we don't take out many clerks nowadays; when we do, we prefer young Scotsmen to young Englishmen. The Englishman has an idea that a colony is a place which wants to be taught how to do its work, and he is apt to be a little patronising. The Scotsman, on the other hand, is willing at once to enter into the ways of the colonies, to take his share of things on our democratic basis, and that is why we like him best.' With the French-Canadian, too, Scotsmen get on very well, and the old association between Scotland—say in the time of Mary Stuart—and France is even to-day an element in that good feeling. Perhaps the French-Canadians as a mass, and especially the French-Canadian farmer who digs his living from the soil by the sweat of his brow, have not learned everything the modern world can teach them, but they have not forgotten either, and certainly they have not forgotten the association of their one-time fatherland with the Scotland of the Stuarts. If anybody ever thought of another Jacobite rebellion, Canada would be a likely place in which to start it. There you have, to begin with, a great stratum of Scotsmen whose Scottish patriotism has been emphasised by the fact that they live out of Scotland; then you have a certain element of Highlanders; and, finally, you have French-Canadians who would feel that the adventurer touched their past. But the thought is too romantic to be carried further.

Canada will be content with the store of romance which Frenchmen of Louis the Fourteenth's time gave her, to which Wolfe and a thousand British warriors added, and which at present is being set in a modern frame by the rapid development of a country that has self-reliance, courage, and millions of acres for the up-springing of new homes. You cannot go to Canada without liking it, and for some weeks after you come back to this old, century-worn, dear land of our own, you see in your dreams the great rivers of Canada rolling down to the sea between banks which are lush with grass and bowered in maple-trees, and you feel on your face the fragrance-laden winds which blow from the shores of Labrador to Quebec and Montreal, to Ottawa and Winnipeg, and over the Rocky Mountains to British Columbia.

THE HOUSE OF WHISPERS.*

By William Le Queux.

CHAPTER XIX.—SHOWS GABRIELLE DEFIANT.

GABRIELLE crossed quickly to one of the long windows, which she unbolted and flung open, expecting to hear the shrill whir of the burglar-alarm, which, every night, Hill switched on before retiring.

'My dear little girl!' exclaimed the man, smiling as he strolled leisurely across to her with a cool, perfect unconcern which showed how completely he was master, 'why create such a beastly draught? Nothing will happen, for I've already seen to those wires.'

'You're a thief!' she cried, drawing herself up angrily. 'I shall go straight to my father and tell him at once.'

'You are at perfect liberty to act exactly as you choose,' was Flockart's answer, as he bowed before her with irritating mock politeness. 'But before you go, pray allow me to finish these most interesting documents, some of which, I notice, are in your very neat handwriting.'

'My father's business is his own alone, and you have no right whatever to pry into it. I thought you were posing as his friend!' she cried in bitter protest, as she stood with both her hands clenched.

'I am his friend,' he declared. 'Some day, Gabrielle, you will know the truth of how near he is to disaster, and how I am risking much in an endeavour to save him.'

'I don't believe you!' she exclaimed in undisguised disgust. 'In your heart there is not one single spark of sympathy with him in his affliction or with me in my ghastly position!'

'Your position is only your own seeking, my dear child,' was his cold response. 'I gave you full warning long ago. You can't deny that.'

'You conspired with Lady Heyburn against me!' she cried. 'I have discovered more about it than you think; and I now openly defy you, Mr Flockart. Please understand that.'

'Good!' he replied, still unruffled. 'I quite understand. You will pardon my resuming, won't you?' And walking back to the open safe, he drew forth a small bundle of papers from a drawer. Then he threw himself into a leather arm-chair, and proceeded to untie the tape and examine the documents one by one, as though in eager search of something.

* Copyright in the United States of America by the Authors' and Newspapers' Association, New York, 1908.

'Though Lady Heyburn may be your friend, I am quite sure even she would never for a moment countenance such a dastardly action as this!' cried the girl, crimsoning in anger. 'You come here, accept my father's hospitality, and make pretence of being his friend and adviser; yet you are conspiring against him, as you have done against myself!'

'So far as you yourself are concerned, my dear Gabrielle,' he laughed, without deigning to look up from the papers he was scanning, 'I offered you my friendship, but you refused it.'

'Friendship!' she cried in sarcasm. 'Your friendship, Mr Flockart! What, pray, is it worth? You surely know what people are saying—the construction they are placing upon your friendship for Lady Heyburn?'

'The misconstruction, you mean,' he exclaimed airily, correcting her. 'Well, to me it matters not a single jot. The world is always ill-disposed and ill-natured. A woman can surely have a male friend without being subject to hostile and venomous criticism?'

'When the male friend is an honest man,' said the girl meaningly.

He shrugged his shoulders and continued reading, as though utterly disregarding her presence.

What should she do? How should she act? She knew quite well that from those papers he could gather no knowledge of her father's affairs, unless he held some secret knowledge of the true meaning of those cryptic terms and allusions. To her they were all as Hebrew.

Only that very day Monsieur Goslin had again made one of those unexpected visits, remaining from eleven in the morning until three; afterwards taking his leave, and driving back in the car to Auchterarder Station. She had not seen him; but he had brought from Paris for her a big box of chocolates tied with violet ribbons, as had been his habit for quite a couple of years past. She was a particular favourite with the polite, middle-aged Frenchman.

Her father's demeanour was always more thoughtful and serious after the stranger's visits. Business matters put before him by his visitor always, it seemed, required much deep thought and ample consideration.

Some papers brought to her father by Goslin she had placed in the safe earlier that evening, and these, she recognised, were now in Flockart's hands. She had not read them herself, and had no idea of their contents. They were, to her, never interesting.

'Mr Flockart,' she exclaimed very firmly at last, 'I ask you to kindly replace those papers in my father's safe, relock it, and hand me the key.'

'That I certainly refuse to do,' was the man's defiant reply, bowing as he spoke.

'You would prefer, then, that I went up to my father and explained all I have seen?'

'I repeat what I have already said. You are perfectly at liberty to tell whom you like. It makes no difference whatever to me. And, well, I don't want to be disturbed just now.' Rising, he walked across to the writing-table, and taking a piece of note-paper bearing the Heyburn crest, rapidly pencilled some memoranda upon it. He was, it seemed, taking a copy of one of the documents.

Suddenly she sprang towards him, crying, 'Give me that paper! Give it to me at once, I say! It is my father's.'

He straightened himself from the table, pulled down his white dress-vest with its amethyst buttons, and, looking straight into her face, ordered her to leave the room.

'I shall not go,' she answered boldly. 'I have discovered a thief in my father's house; therefore my duty is to remain here.'

'No. Surely your duty is to go upstairs and tell him;' and he bent again, resuming his rapid memoranda. 'Well,' he asked defiantly a few moments later, seeing that she had not moved, 'aren't you going?'

'I shall not leave you here alone.'

'Don't. I might run away with some of the ornaments.'

'Oh yes!' exclaimed the girl bitterly, 'you taunt me because you are well aware of my helplessness—of what occurred on that never-to-be-forgotten afternoon—of how completely you have me in your power! I see it all. You defy me, well knowing that you could, in a moment, bring upon me a vengeance terrible and complete. It is all horrible!' she cried, covering her face with her hands. 'I know that I am in your power. And you have no pity, no remorse.'

'I gave you full warning,' he declared, placing the papers upon the table and looking at her. 'I gave you your choice. You cannot blame me. You had ample time and opportunity.'

'But I still have one man who loves me—a man who will yet stand my friend and defend me, even against you!'

'Walter Murie!' he laughed, with a quick gesture of disregard. 'You believe him to be your friend? Recollect, my dear Gabrielle, that men are deceivers ever.'

'So it seems in your case,' she exclaimed with poignant bitterness. 'You have brought scandalous comment upon my father's name, and yet you are utterly unconcerned.'

'Because, as I have already told you, your father is my friend.'

'And it is his money which you spend so freely,' she said in a low, hard voice of reproach. 'It comes from him.'

'His money!' he exclaimed quickly. 'What do you mean? What do you imply?'

'Simply that among my father's accounts a short time back I found two cheques drawn by Lady Heyburn in your favour.'

'And you told your father of them, of course?'

he exclaimed with sarcasm. 'A remarkable discovery, eh?'

'I told him nothing,' was her bold reply. 'Not because I wished to shield you, but because I did not wish to pain him unduly. He has worries sufficient, in all conscience.'

'Your devotion is really most charming,' the man declared calmly, leaning against the table and examining her critically from head to foot. 'Sir Henry believes in you. You are his dutiful daughter — pure, good, and all that!' he sneered. 'I wonder what he would say if he—well, if he knew just a little of the truth, of what happened that day at Chantilly?'

'The truth! Ah, and you would tell him—you!' she gasped in a broken voice, her sweet, innocent face blanched to the lips in an instant. 'You would drag my good name into the mire, and blast my life for ever with just as little compunction as you would shoot a rabbit. I know—I know you only too well, Mr Flockart! I stand in your way; I am in your way as well as in Lady Heyburn's. You are only awaiting an opportunity to wreck my life and crush me! Once I am away from here, my poor father will be helpless in your hands!'

'Dear me,' he sneered, 'how very tragic you are becoming! That dressing-gown really makes you appear quite like a heroine of provincial melodrama. I ought now to have a revolver and threaten you, and then this scene would be complete for the stage —wouldn't it? But for goodness' sake don't remain here in the cold any longer, my dear little girl. Run off to bed, and forget that to-night you've been walking in your sleep.'

'Not until I see that safe relocked and you give me the false key of yours. If you will not, then you shall this very night have an opportunity of telling the truth to my father. I am prepared to bear my shame and all its consequences'——

The words froze upon her pale lips. On the lawn outside the half-open glass door there was at that moment a light movement—the tapping of a walking-stick!

'Hush!' cried Flockart. 'Remember what I can tell him—if I choose!'

In an instant she saw the fragile figure of her father, in soft felt-hat and black coat, creeping almost noiselessly past the window. He had been out for one of his nocturnal walks, for he sometimes went out alone when suffering from insomnia. He had just returned.

The blind man went forward only a few paces farther; but, finding that he had proceeded too far, he returned and discovered the open door. Near it stood the pair, not daring now to move lest the blind man's quick ears should detect their footsteps.

'Gabrielle! Gabrielle, my dear!' exclaimed the Baronet.

But though her heart beat quickly, the girl did not reply. She knew, however, that the old man could almost read her innermost thoughts. The ominous words of Flockart rang in her ears. Yes, he could tell a terrible and awful truth which must be concealed at all hazards.

'I felt sure I heard Gabrielle's voice. How curious!' murmured the old man, as his feet fell noiselessly upon the thick Turkey carpet. 'Gabrielle dear!' he called. But his daughter stood there breathless and silent, not daring to move a muscle. Plain it was that while passing across the lawn outside he had heard her voice. He had overheard her declaration that she was prepared to bear the consequences of her disgrace.

Across the room the blind man groped, his hand held before him, as was his habit. 'Strange! Remarkably strange!' he remarked to himself quite aloud. 'I'm never mistaken in Gabrielle's voice.—Gabrielle dear, where are you? Why don't you speak? It's too late to-night to play practical jokes.'

Flockart knew that he had left the safe-door open, yet he dared not move across the room to close it. The sightless man would detect the slightest movement in that dead silence of the night. With great care he left the girl's side, and a single stride brought him to the large writing-table, where he secured the document, together with the pencilled memoranda of its purport, both of which he slipped into his pocket unobserved.

Gabrielle dared not breathe. Her discovery there meant her ruin.

The man who held her in his toils cast her an evil, threatening glance, raising his clenched fist in menace, as though daring her to make the slightest movement. In his dark eyes showed a sinister expression, and his nether lip was hard. She was, alas! utterly and completely in his power.

The safe was some distance away, and in order to reach and close it he would be compelled to pass the man in blue spectacles now standing, puzzled and surprised, in the centre of the great book-lined apartment. Both of them could escape by the open window, but to do so would be to court discovery should the Baronet find his safe standing open. In that case the alarm would be raised, and they would both be found outside the house, instead of within.

Slowly the old man drew his thin hand across his furrowed brow, and then, as a sudden recollection dawned upon him, he cried, 'Ah, the window! Why, that's strange! When I went out I closed it! But it was open—open—as I came in! Some one—some one has entered here in my absence!'

With both his thin, wasted hands outstretched, he walked quickly to his safe, cleverly avoiding the furniture in his course, and next second discovered that the iron door stood wide open.

'Thieves!' he gasped aloud hoarsely as the truth dawned upon him. 'My papers! Gabrielle's voice! What can all this mean?' And next moment he opened the door, crying, 'Help!' and endeavouring to alarm the household.

In an instant Flockart dashed forward towards the safe, and, without being observed by Gabrielle, had slipped the key into his own pocket.

'Gabrielle,' cried the blind man, 'you are here in the room. I know you are. You cannot deceive me. I smell that new scent, which your aunt Annie sent you, upon your handkerchief. Why don't you speak to me?'

'Yes, dad,' she answered at last, in a low, strained voice, 'I—I am here.'

'Then what is meant by my safe being open?' he asked sternly, as all that Goslin had told him a little while before flashed across his memory. 'Why have you obtained a key to it?'

'I have no key,' was her quick answer.

'Come here,' he said. 'Let me take your hand.'

With great reluctance, her eyes fixed upon Flockart's face, she did as she was bid, and as her father took her soft hand in his he said in a stern, harsh tone, full of suspicion and quite unusual to him, 'You are trembling, Gabrielle—trembling, because—because of my unexpected appearance, eh?'

The fair girl with the sweet face and dainty figure was silent. What could she reply?

(To be continued.)

SOME CELEBRITIES I HAVE KNOWN.

By A. STODART WALKER.

PART IV.

WILLIAM EWART GLADSTONE—JOHN BRIGHT—THE MARQUIS OF DUFFERIN—LORD RUSSELL OF KILLOWEN — WHISTLER — AUBREY BEARDSLEY — MRS BISHOP — SIR HENRY IRVING—JOHN L. TOOLE.

HAVE several letters from Mr Gladstone, one or two on political questions and the remainder on matters pertaining to Homeric or literary subjects. I have no post-cards—which is remarkable, considering how customary was his use of this facile Government commodity; neither do I find any amongst the extensive correspondence which he carried on with John Stuart Blackie, and which is now in my possession. The first time I had the honour of meeting the great Liberal Minister was in the summer of 1890, when I called, on his invitation, at his London residence. My memory of that visit is as of one paid to an oracle. Our interview can hardly be described as that of a conversation, which perhaps is natural under the circumstances, considering how little I had to give and what rich veins of good things he was able to tap. At first I was a little perturbed by the intensity, almost fierceness of his manners; but this feeling was soon relieved by the thought of what a compliment he paid me in opening the rich founts of his knowledge and experience for my benefit. For an hour he talked almost unceasingly, first on Cardan and the medicine-men of the Middle Ages, then on the importance of the message of the Jewish prophets, after that on the Homeric devil, and finally on the value of reverence in the training of the citizen. The latter, however, was introduced more as a reflection on the new eclectic spirit than as a purely abstract and detached quality of the mind. I think he suspected that, being a student of science, I might be tarred with the brush of the newer scepticism. At any rate, it was led up to by a remark of my own *à propos* of a recent visit to Mr Herbert Spencer. I can hardly affirm the impression of others that the great politician was of a sympathetic temperament. He was kind and expansive to me in the heroic style, but it seemed rather like the kindness of an unbending dominie to a pupil whose trend of mind was of a markedly suspicious quality. I could not help recalling the saying of Disraeli that Gladstone was accustomed to address the Queen as if she were a public meeting. During the whole of our interview he addressed me as if I might be a possible offender. But I appreciated highly the honour he paid me in seeing me at all. He spoke, in passing, in high eulogium of the character of Professor Blackie, in very much the same spirit as he wrote when my relative died in 1895: 'Your uncle was so genuine, so simple, so susceptible of a pure enthusiasm, so detached from self, so attached to things kindly, pure, and noble.'

The second occasion I met Gladstone was in 1894, when he was staying at Fisher's Hotel, Pitlochry. I accompanied Professor Blackie, and we were received by a relative of the aged statesman, who expressed the hope that owing to the state of Mr Gladstone's health nothing might be said that would disturb his peace of mind. This was a sufficient damper to quell any desire to say what my natural timidity in the face of so portentous a personality might suggest, so I sat silently by, or engaged in rather a rickety conversation with Mrs Gladstone, while Blackie kept up a vigorous battle with the statesman on matters of Greek, and chiefly on the character and teaching of Socrates; the statesman speaking rather severely of the morals of the latter, and expressing far more liking for Xanthippe, who indeed must have felt bored at times by a man whose desire for argument was as keen as the man whose love of research led him to peep and botanise on his mother's grave. The conversation drifted on to more general grounds, and Gladstone said, 'We are both getting on in life now, Blackie, though I should fancy you are the younger man.' 'No,' replied Blackie, 'I can give you five months, and Tennyson two. We were all three born in 1809.' 'Ah,' suggested Gladstone, 'Tennyson would not thank you for associating him with two such disturbing elements as you and I,

Blackie.' 'I a disturbing element!' cried Blackie in mock anger. 'I like that; my practice is St Paul's—I speak the truth in love.' 'Truth,' replied Gladstone, 'is invariably disturbing to those who are unaccustomed to it.' 'True,' said Blackie, 'most people prefer half a truth, which, as Goethe said, is worse than a lie.' 'I can never understand how a man of your high moral ideals can so persistently hold forth Goethe to the admiration of the world,' criticised Gladstone. 'As Napoleon said of him, "*Voilà un homme!*"' retorted Blackie; 'and I love big men—St Paul, Goethe, and Walter Scott. Goethe was not a moral delinquent, as many suppose. Of course he was always falling in love, but he was a poet, and naturally felt more keenly and saw more sharply than ordinary men. The poet who during a long life can love only one woman or live on one idea is intense but narrow. The point is not how often he fell in love, but how he comported himself when in love.' The argument did not end there, but gradually drifted into a general discussion on ethics. Suddenly Gladstone turned to me and said, 'Now, sir, you may speak to me!' Not a very good opening for self-confidence on my part, and I actually—despite all my hatred of the subject—stumbled on to the weather! But Gladstone, with that genius for selection which was characteristic of him, took my text for an eloquent discourse on the effect of climate upon character and upon the national point of view, and soon after we took our departure.

One legend about the great Liberal Minister I am able to label as a myth. Soon after his death an article appeared in one of the reviews in which the writer spoke of the hawk-like eyes of the statesman, and proceeded to elaborate an incident which was supposed to have occurred at Dalmeny, in which Professor Blackie was the leading actor. From the narrative recorded we gather that Blackie was giving vent to certain favourite opinions on the Homeric devil, when Gladstone suddenly turned his eyes full upon him; whereupon the Professor of Greek is said to have suddenly become as if hypnotised or as if in a state of catalepsy, and to have sunk into his seat. Imagine Blackie being paralysed by eyes of man or even of devil! The truth of the story is this: Blackie was holding forth on some matter of politics, when suddenly, observing Gladstone looking disapprovingly at him, he paused, and with mock humility covered his face with his hands and groaned aloud, 'The presumption of Johnny! Fancy a mere Professor of Greek daring to contradict the Prime Minister of England.' The situation was not tragic, it was only humorous, though I fancy it was not at all to Gladstone's liking.

His peace-loving colleague, Mr John Bright, I met but once, and my chief memory of him bears relation to the land question, and I was greatly surprised to find that, though a fighting Radical, he had not much hope for the betterment of the people by the reform of the land-laws, especially in Scotland. 'Back to the land' did not appeal to him. The rest of our conversation was on war and peace, and I can remember, as we parted, he rolled out in rich and mellifluent tones this couplet:

> In peace sons bury their fathers,
> In war fathers bury their sons.

A man I always recall with great esteem and equally great affection is the late Lord Dufferin. I have few memories more precious than those associated with him. His kindness to me was that of a father and a considerate guardian. I was first introduced to him when I went to live in Paris in 1892. On the morning of my arrival I forwarded my letter of introduction to the British Embassy, and with that ready courtesy so characteristic of him he sent round a messenger the same afternoon to my hotel, begging me 'to do him and Lady Dufferin the honour' of dining with him that night. His reception of me was of the most frank and friendly nature. He went so far as graciously to offer me the hospitality of the Embassy till such a time as I might be settled in a residence in Paris, and asked me to luncheon again next day, so as to be able to discuss with me what means he could take to ensure friendly hospitality in the French capital. 'Do not hesitate at any time to use me if I can be of any use,' he said; and that was at a time when internal diplomatic stories were rampant, and when he was under the lash of a large section of the advanced press of Paris. He introduced me to the President, to Benjamin Constant, to Madame Blaze de Bury, to Whistler, Carolus Duran, Pierre Loti, to Casimir Périer, Jules Simon, to Renan, to Bouguereau, to Pasteur, and to many others of the contemporary lights in politics, science, literature, and art. It was altogether a delightful experience of perfectly disinterested friendship such as even the most casual might remember with enthusiasm, and to a young man it was a revelation of generosity and detached unselfishness that seemed the very epic of courtesy. Throughout the whole of my long residence in Paris, the cordiality of Lord Dufferin never grew anæmic or halting, and in after-years I had many opportunities of paying a tribute to the rich profundity of his kindness. Even when entering the valley of the dark shadow he took an opportunity of expressing, in what seemed to me an altogether exaggerated way, his gratitude for some little service I was able to render him, and at the very mouth of the pit sent me a beautiful letter accompanied by the gift of a book and a photograph. He has always seemed to me the embodiment of all that was noble and princely in mankind—a stainless knight of diplomacy, a rich treasure-house of kindness and unselfishness. I have yet to meet his equal.

Another Irishman I met in Paris, with whom I was connected in a Rectorial Election in Edinburgh, was Sir Charles Russell, afterwards Lord

Russell of Killowen; but although I was his chairman in the election mentioned, and although I met him on several occasions, I cannot say I ever entered intimately into the life of the man. To me he seemed hard, unsympathetic, and strangely ignorant of matters with which I imagined a man in his position would be conversant. He attacked certain practices with an oratorical vigour that did not run hand-in-hand with his knowledge of the subject. His attitude towards experimental science, for example, was not that of a man of culture, but that of one who considered immature opinion and popular hearsay as sufficient grounds for his rhetorical protests. He was a striking contrast to Lord Dufferin. But as it was impossible on my part—and I am quite willing to accept the blame of incompetence in the matter—to come into sympathetic touch with him, I am disqualified from giving a fair estimate of the man; for unless one comes into sympathetic relationship with a person one is never able to pass a satisfactory judgment upon him. The person I disliked may not have existed at all, except in my imagination, and I imagine that applies to all persons to whom we are antipathetic. For I generally find that when A. dislikes B., the A. and B. of the dislike are non-existent, but are only creatures of the imagination labelled A. and B. respectively. When A. gets to know the real B., and B. the real A., in the majority of cases dislike is changed into admiration or at least into fair appreciation. At any rate, I can speak with unstinted enthusiasm of Russell's greatness as a special pleader. I heard him plead the cause of our country in the Behring Strait Commission in Paris; I sat out the whole of the Maybrick trial in Liverpool; I heard him speak before the Parnell Commission, and in each case I was able to appreciate and admire the brilliant part he was able to display as an advocate of the first rank. I should imagine his pleading was more brilliant than his law; but of that I am unable to judge. I only recall one of the most impressive advocates that it has been my privilege to hear addressing a jury.

I once went to dine with Whistler in Paris. When I arrived I found a goodly assembly of people waiting in the great artist's studio; but though half-an-hour—three-quarters even—passed, no host appeared. At the end of that time the man, at whose feet all were willing to sit, made his entry nonchalantly, calmly, absolutely unconcerned as to time and place. 'Ah, my friends,' he said, 'you dine with me? That is charming. I had better inquire if there is really anything to offer you;' and he forthwith laid his hand on the bell. Of course there was an excellent dinner served, and much more excellent conversation to run in harness with the food and wine. I remember he questioned me as to my doings in Paris, and I mentioned, with a degree of self-satisfaction, the several artists I had met. 'Dear, dear,' he said, 'what curious company you have been keeping! I indeed pity you!' I cannot be quite certain—I may be like George IV., who imagined he fought at the battle of Waterloo—but I fancy I am right in saying that it was on that occasion that Whistler made a repartee which always seemed to me to be full of the most subtle humour. I asked him if some fellow-craftsman had never had the courage to inquire of X. (naming a popular and academically distinguished painter) why he persisted in painting. 'Ah, but, my dear sir, you forget he is very fond of it.' I do remember one fact very clearly. Whistler sat for some time gazing silently at one of his own pictures, really a great effort of the master, which hung on the wall of his dining-room. For some time he paid no attention to the numerous questions that were being put to him. After the space of some few minutes he broke the silence by saying, 'Truly, I never quite realised till now what a magnificent thing that is. It is astoundingly brilliant. It will be a source of unmitigated delight to me.' During the dinner the conversation turned on the aspect of art on the commercial side, and I told him of a recent visit I had paid to the studio of a famous Royal Academician in London, during which the notable painter had hinted that I should purchase a certain picture in his possession at the time. 'My dear Mr A.,' I had replied, 'I am a mere pauper with artistic taste.' 'Yes,' said Whistler when I had finished, '*both* reasons why you were to be excused.'

At the dinner in question I observed a curiously shy, rather effeminate-looking young man, with fair hair brushed well forward on his forehead so as to form a fringe as distinct and as full as any woman's. He spoke little, but spent most of his time drawing quaint designs on the glass shades of the small lights that stood upon the table. I learnt afterwards that this was Aubrey Beardsley, who was to come into such vogue through the medium of the famous *Yellow Book*. I met him again several times in London, and considered him the strangest and most inhuman being I had ever met, and, it seemed to me, an unusual example of the phthisical psychopathic. His writings—which he used to read aloud to select parties in London, several of which I attended—were on a par with his extraordinarily brilliant but erratically erotic drawings; and though it were a matter for regret, it was not a matter for surprise to me that his career was as short as it was scintillating.

Of travellers and voyagers I have met not a few. Sir Samuel and Lady Baker, Miss Kingsley, Miss Gordon Cumming, Mr Jackson, are amongst the many; but I think Mrs Bishop (Isabella Bird) was the most remarkable. I had read several of her books before I had the pleasure of meeting her, and I shall never forget my surprise when she first entered the room in which I was sitting in Edinburgh. Could it be possible that this timid, gentle, soft-speaking invalid was the Mrs Bishop of *Unbeaten Tracks in Japan* and *Journeys in Persia and Kurdistan?* There was no doubt as to the identity,

but the paradox seems to demand an explanation. How was it possible that this frail, apprehensive, and nervous creature could have travelled two thousand five hundred miles at a stretch; could have traversed, practically unguarded, through the wild country of the Kurds; could have submitted to the unspeakable hardships of her many explorations? It was not a case of temporary illness handicapping a vigorous constitution, of a nervous collapse following on inordinate strain, for I met her very often in after-years, and the same condition of affairs was always present. I took occasion at the time of her death, in a leader in the *Edinburgh Medical Journal*, to remark on this curious fact. The invalid at home and the Samson abroad do not form a very usual combination, yet in Mrs Bishop's case these two ran in tandem for many years. Mrs Bishop was, indeed, one of those subjects who are dependent to the last degree upon their environment to bring out their possibilities. It is not a question of dual personality; it is the varied response of a single personality under varied conditions. Of course the response can only be maintained in an active environment, where there is a large storehouse of energy behind it all. When Mrs Bishop took the stage as a pioneer and traveller she laughed at fatigue, she was indifferent to the terrors of danger, she was careless of what a day might bring forth in the matter of food; but stepping from the boards into the wings of life, she immediately became the invalid, the timorous, delicate, gentle-voiced woman that I associate with the Mrs Bishop of Edinburgh. One explanation goes a considerable way to throw light upon the paradox. As her husband said, 'Isabella has the appetite of a tiger and the digestion of an ostrich. She could go for days with little more than a bowlful of rice and a handful of dates; but when substantial food was to her hand she took an ample revenge.' 'I am,' she said, 'a savage in the matter of food.'

In a former number of this *Journal* (Christmas Number, 1906) I have given my reminiscences of Sir Henry Irving, which fact may serve as an excuse for any further extended reflections on the subject. I have there described his visit to the Edinburgh University Union during the time that I was president, and his connection with the University Dramatic Society. I also touched upon the memorable occasion when he described to me how he first conceived the character of Shylock. In addition to what I wrote on that former occasion I may mention that Irving once suggested to me, or perhaps I made the suggestion to him, that he might make something out of the character of John Knox, and for some time I had in my mind a romantic play in which Miss Ellen Terry might figure as Mary Queen of Scots and Irving as the great Reformer. 'It would be a very grim study,' said Irving, 'yet full of great possibilities. Try it, my dear sir—try it. Make a preliminary cast of your conception and show it to me.' But, alas! other interests and other concerns prevented the carrying out of anything further than a careful study of the period involved.

Mr L. F. Austin once told me an amusing episode in the relationship of Irving and Lord Tennyson when the preparation was being made for the production of *Becket*. On one occasion, during a discussion of the details of the play, the poet-laureate, being fatigued, rang the bell and ordered a bottle of port, which he immediately proceeded to discuss. Irving was not averse to tasting the wine himself, and as Tennyson went on with his reading, punctuated by the replenishment of his glass, the actor regarded the bottle with frank sympathy. At one time, indeed, his hand seemed to go forward to caress the carafe, but immediately the poet refilled his glass and went on reading without suggesting that Irving should join him. Towards the end of the sitting, Tennyson looked pathetically at the empty decanter, and from it to the actor. 'By-the-bye,' he said, with ingenuous simplicity, 'I forgot to ask you if you would join me.'

I met Mr Toole frequently; but as the many excellent anecdotes with which he favoured me have been made familiar to the public, I abstain from repeating them. I may recall, however, his version of a certain breakfast-party he attended at Mr Gladstone's. 'Your uncle, Professor Blackie, was there,' he said, 'and Lord Houghton, Mr Roden Noel, Knowles of *The Nineteenth Century*, and others. They talked on German literature, Goethe, Carlyle, Wedgwood china, and a host of other subjects which were Greek to me, and I assure you the conversation was on such a high pitch that when I left the house I immediately chummed up with a policeman, to bring myself down to my usual intellectual level.'

Of other stage recollections I recall one in connection with a certain well-known provincial tragedian called Henry L——. I happened to be calling on the lessee of a Liverpool theatre, and as we were talking together Mr L—— entered. He was a tragedian of the old flamboyant school—long hair, striding gait, Irving-voice, and the rest. 'I propose,' he said, 'to produce on Friday the play of *Richard III.*' 'Yes, so I understand,' said the lessee. 'I shall require two armies—one the army of Richard and the other the army of Richmond.' 'Certainly,' agreed the man of the theatre. 'I shall want a hundred men for the army of Richard and a hundred men for the army of Richmond.' 'Two hundred supers!' cried the lessee. 'The thing's impossible.' 'Very well,' said the actor, 'fifty men for the army of Richard and fifty men for the army of Richmond.' 'How could we possibly afford a hundred supers?' asked his coadjutor in wonderment. 'Very well,' continued L——, unabashed, 'twenty-five men for the army of Richard, twenty-five for the army of Richmond.' 'My dear Mr L——, consider the expense,' pleaded our friend. 'Very well, ten men

for the army of Richard, ten for the army of Richmond.' 'But my theatre cannot afford even twenty supers,' said the lessee in desperation. 'Very well,' said the actor, without being in the least perturbed, 'five men for the army of Richard and five for the army of Richmond,' and with these words Mr L——, bidding us a histrionic adieu, strode impressively from the room; and on the night of the performance there were four supers for the army of Richard and two for that of Richmond.

I remember going once to see a famous actor who is still living, and shall, therefore, be unnameable. The versatile genius is famous for his absent-mindedness; as has been truly said, 'he is always thinking of something else.' When I was announced (I came by invitation) the actor arose and greeted me with gushing enthusiasm. 'I am very glad to see you,' he said. 'I thought you had quite forgotten me.' He beckoned me to a chair, and then turned to a friend who was with him, and said *sotto voce*, 'I don't know who the man is from Adam.' It is recorded of this same actor that he was once visited in his dressing-room at the fall of the curtain by a perfervid admirer, who exclaimed, 'This is the greatest play you have ever produced.' 'Really,' said the actor, 'how remarkable!' at the same time stretching out his hand and touching the electric bell. On a servant appearing he turned to him and said, 'I should be much obliged if you will kindly find out what piece we are producing to-night.'

At this point these recollections may fitly close. There are many others I might have supplied, but the majority of them are relative to notabilities who are still living, and that fact may serve as a decent apology for my reticence, and I sincerely hope that it may be many years before the necessary qualification will supply me with another sheaf of personal recollections of notable men.

THE END.

THE PIRACY OF THE 'CHACABUCO.'

TOLD TO LOUIS BECKE BY ONE WHO TOOK PART IN IT.

IN the London *Daily Telegraph* of 17th April last year there is a long account taken from the Sydney newspapers of 9th March of a shocking act of piracy that had just come to light in the Gilbert Islands, North Pacific. Briefly it was as follows: Whilst at Apamama Lagoon, Captain Malcolm of the Sydney steamer *Laurel* found piled up on the weather-reef of the lagoon a fine American-built schooner, with two men living on board. They refused to give any account of themselves, and declined any assistance. Later on, however, they were arrested by the native magistrate, placed in irons on board the *Laurel*, conveyed to Tarawa Lagoon, and handed over to the British Resident. On the voyage the younger of the two men confessed their secret to the captain of the *Laurel*. His name is Jackson, that of the other Mortimer, who is a Belgian. The schooner (whose name they had obliterated) was the *Neuve Tigre*, of Callao, which place she had left with a cargo of coke for one of the coastal ports. There was a crew of four all told, including the captain, mate, Mortimer, and himself. Mortimer had previously planned to take the ship and run away with her to Australia, and forced Jackson to enter into his plans under threats of murdering him. One day, as the mate was working at the rigging, Mortimer made an attack on him with a hatchet, wounding him severely. The poor man fled up aloft. Then, as the captain emerged from the cabin, Mortimer felled him with a blow from the back of the hatchet and stunned him, then went below and returned with a rifle. Pointing it at the mate, he gave him his choice of jumping overboard or being shot. Vainly the mate pleaded for mercy, and then he leapt overboard and sank. The murderer then turned his attention to the captain, who had now recovered consciousness, and gave him the option of being shot or jumping overboard. He chose the latter course, and sprang over the rail. Mortimer and Jackson then jettisoned the cargo, and shortly afterwards the schooner ran ashore on the weather-reef of Apamama Lagoon as narrated.

Even down to the present time there have been several cases of piracy, attended with wholesale slaughter, in the South Seas, one of the most notable being that of the Tahitian schooner *Nuroahiti* early in the nineties. Two brothers named Rorique, who were Belgians, were the criminals. One had shipped as mate; the other was a passenger, and was to be landed on one of the Paumotu Group as a trader. The ship's complement consisted of the captain, mate, Mr Gibson the supercargo, a Chileno cook, and three native seamen. One night the brothers (who had planned with the cook to seize the ship) carried out their plans. The captain was shot in the back as he stood on deck, Gibson was murdered in his sleep, and both bodies at once thrown overboard, after the captain's watch and chain and rings had been taken from him. One of the native sailors was also shot and thrown overboard; but the other two, if I remember rightly, succeeded in escaping one night by quietly slipping overboard and swimming to an island which the schooner was then passing.

The two Belgians then bore away for the Bonin Islands, *viâ* the Caroline Islands; and another vessel, of which the writer was then supercargo,

actually met the *Nuroahiti* between Strong's Island and Ponapé. We tried to speak her, but she declined, and would not even show her colours. Some months later, when at Levuka (in Fiji) or Apia, I forget which, the captain and I read the account of the piracy, which came to light through the two natives reaching Tahiti. The Papeite newspaper *Messager du Tahiti* published their narrative, which was translated and published by all the leading Australasian papers, and this ultimately led to the arrest of these merciless ruffians. The captain and I at once wrote to the Captain-General of the Philippine Islands at Manila, telling him that the vessel which we had met was undoubtedly the *Nuroahiti*, as she answered exactly to the description given of her in the *Messager du Tahiti;* also that she was making a course for the Western Carolines. The letter took nearly two months to reach Manila; and, by a strange coincidence, a week later the Captain-General received a communication from the Governor of Ponapé (Caroline Islands), informing him that many months previously a small schooner had arrived at the island with only three men on board, and that they did not give a satisfactory account of themselves, but he did not feel justified in detaining them. The Captain-General at once sent the gunboat *Pizarro* to Ponapé, the schooner was seized, and the three men put in heavy irons. The Chileno cook then confessed the crime. The Rorriques denied their guilt, and, claiming to be French citizens, were sent to France. They were tried at Toulon, and (through some unknown source) a large sum of money was forthcoming for their defence, but the evidence against them was overwhelming. Still, they escaped the guillotine, and are now serving a life-sentence in irons in the penal colony of Cayenne.

The various expeditions that have visited the Cocos Islands (six hundred miles from Panamá) during the past sixty years, in search of the enormous treasure that the pirate Benito undoubtedly placed there long before, have provided some grim and bloody tragedies in the way of piracies and mutinies, none of which, as far as I know, have been recorded in print in English; but I was once, at Guam, shown a work in Spanish, printed at Madrid in 1843, giving an account of a Cocos Island treasure-hunting tragedy which had occurred twenty years previously. The expedition sailed from Callao, reached the island, and began digging, in two contingents, at different spots. The leader of one party believed that the others had come across the treasure and were keeping it secret, and attempted to destroy the whole lot of them by poisoning some jars of wine. Many did die, and the survivors took to the bush, where they were hunted day by day and shot down, until only ten remained. They were afterwards rescued by a Havre sperm-whaler, and landed at Valparaiso. The attacking party, failing to discover the treasure, then decided to turn pirates, and sailed for the coast of Mexico; but before they had taken a single prize the vessel was cast away on the coast, and all of the gang but three perished in the surf.

Now to my story of the *Chacabuco* piracy.

When I was supercargo to the famous (and much-maligned) Captain 'Bully' Hayes, in the brig *Leonora*, we called at the little island of Mokil (M'Askill's Group, in the North Pacific) to buy turtle, and take away the spars, copper, and ground-tackle of a brig which had been wrecked there. Hayes introduced me to the one white trader, an old white-haired man named Harry Jonas, who had a very bad record all over the Pacific both with whites and natives, and was greatly feared, for he possessed a violent temper and had taken many lives. Nevertheless Hayes employed him as a trader, and found him straightforward and honest in his dealings.

During the two days and nights that the *Leonora* lay off and on the island, and the work of stripping the copper, &c., from the wrecked vessel was going on, Hayes and I spent a good deal of our time on shore at Jonas's house, taking most of our meals there; and the old fellow treated us with much rough hospitality, and later on told us some of his life's history. He was sixty-four years of age, short, square-built, and muscular, clean-shaven, and had bushy white brows overhanging eyes of steely blue. He was dressed much like a blue-jacket, his open jumper revealing his brawny throat; a well-made Panamá hat covered his head of luxuriant curly white hair; and altogether he was, if not a handsome man, one of a very striking appearance, and would quickly have attracted notice even were he in the midst of a crowd of South Sea traders of those days.

Hayes and I had been telling him of a mutiny that had taken place on a Peruvian guano-ship which we had met at Samoa, and which had put into port with half the crew in irons and three of them dead, when the old man promised to tell us his story of the '*Chacabuco* muss,' as he called a strange and horrible episode in his strange and adventurous career. He had previously told Hayes —for whom he had a great liking—something of his past life. Born in London, he was apprenticed to a cooper; but, as the old-time story-writers would say, 'fell into evil ways,' and with two other lads was caught stripping lead from the roof of a church. He was sentenced to two years' imprisonment; but through the influence of the rector of the church he was allowed to enlist in a foot regiment, two companies of which were then leaving for St Helena. After eighteen months' service he escaped from the island in an American whaler, which was short-handed. Stripping off his uniform and leaving it on the beach (as if he had been bathing), and putting on a dirty suit given him by one of the whaleship's mates, he succeeded in getting safely on board. After several whaling voyages, extending over many years, he drifted to

Japan and shipped as second-mate on a Pribylof Islands sealing-schooner, which was afterwards lost on her return on the Japanese coast, and Jonas and two companions were imprisoned by the authorities for a year and treated with the most fearful brutality. Liberated at last, he entered the service of a firm of Chinese shipowners as mate. The vessel was captured by pirates in broad daylight near Macao, the captain, his wife, and two children, and nearly all the crew, being ruthlessly slaughtered, and the ship, after being looted, was set on fire. Jonas and the carpenter had shut themselves up in a deck-house, and although both were wounded they made a determined resistance; but when the pirate-junk cleared off they succeeded in putting out the fire, and were rescued the following day. He then made his way to Callao, in South America, in a coolie-ship, left her there, and went to Valdivia as A.B. on a French barque. At Valdivia he deserted, and was hidden by an American storekeeper named Frayne or Train. This man was the owner of a large brigantine named the *Chacabuco*. She was employed in the coastal trade and amongst the Chiloe Islands, her trips extending as far north as Valparaiso; and she was then ready to sail for Valparaiso with a cargo of hides, tallow, &c., and also one hundred and twenty casks of French brandy. The latter had been salved from the wreck of a vessel which had run ashore on one of the Chiloe Islands, and the American owner of the *Chacabuco* expected it to bring a high price in Valparaiso.

The American wanted a boatswain for the brigantine, and Jonas got the berth. The vessel was commanded by an elderly Dane, who was accompanied by his young wife (a Spanish-American lady) and his son by a former marriage, a lad of sixteen, who acted as cabin-boy. The mate was a Belgian named Rouel or Rule (the Belgians in the South Seas seem to have as bad a reputation as they have in the Congo); and the second mate, steward, cook, and the other hands for'ard were all Spanish-Americans of some sort or other, except two American negroes, who, with Jonas, were the only real sailormen of the whole crew.

From the first Jonas noticed that the captain and mate did not pull together, and the negroes told him that Rouel was bitterly disappointed at not having been given the command of the brigantine instead of the Dane.

The *Chacabuco* was a bad sailer, and overmasted as well; and the Danish skipper, who was a cautious man, always took in his light sails when the ship was on a wind in a strong breeze. This made Rouel sneer and 'talk' of the captain behind his back to the crew, with whom he was unduly familiar.

Five days out, during the middle watch, the watch below broke through the fore-peak bulkhead into the hold and broached a cask of brandy; they were soon riotously drunk, and some of them brought up liquor to the watch on deck. The captain, aided by the two mates—who were very unwilling to help him and Jonas—put some of the men in irons; then quiet was restored, and the broached cask of brandy was brought into the cabin, and the bulkhead repaired and secured by Jonas. This alone earned him the enmity of the cut-throat crew.

Two days later the whole crew, excepting the negroes, came aft in a body and demanded a gallon of brandy, complaining that they were overworked by continually shortening sail when it was unnecessary. The captain refused, and ordered them for'ard. The treacherous Belgian mate told the men that their demands were unreasonable, though he had actually inspired them.

That night, in the middle watch, which was the second-mate's, and whilst the vessel was creeping slowly over a quiet sea, the captain's son was awakened by the sound of something falling on the cabin floor. As he slept on the transom lockers he had a good view of the whole of the cabin, and, to his astonishment, he saw the mate picking up a pistol and putting it into a canvas bag which seemed very heavy. Then the man crept silently away up the companion. The boy at once aroused his father, who was a heavy sleeper, and told him what he had seen. The captain was alarmed, so at once dressed and armed himself; and whilst doing so Rouel returned below, went quietly to his cabin, and closed the door.

Jonas and the negroes slept in the deck-house adjoining the sail-locker and galley. The captain, who had previously removed all the small arms from the rack around the mainmast, which came down at the head of the cabin-table, gave his son three loaded pistols to take as quietly as possible to Jonas and the negroes—who were all in the mate's watch—and told him to warn them to be on their guard, as he feared mischief was afoot. The lad accomplished his errand safely, though he was seen by some of the crew.

When eight bells struck, the watch below turned out as usual, and all was quiet till breakfast-time. Meanwhile the boy had managed to let Jonas know that he had secreted fifty cartridges, a bag of bullets, some tins of powder, and a box of caps in his (Jonas's) bunk. The pistols were old-fashioned muzzle-loaders.

When the steward served breakfast, a little after eight o'clock, one of the negroes named Gollett, who had just taken the wheel, was told to give it to another man and go and get his breakfast—a most unusual thing, and quite against the usual routine. He had just reached the deck-house, where he found Jonas eating his breakfast, when they heard three shots in quick succession. At the same time they heard their door being locked from the outside, and then loud cries of triumph from the crew.

At their end of the deck was a small port; and, looking through it, they beheld a dreadful scene. First the dead body of young Gustav, the captain's

son, was dragged up on to the poop-deck by some of the crew, and thrown overboard at the order of the second-mate; then followed that of his step-mother, who seemed, so Jonas said, to be still alive when she was cast over, for he saw her partly raise one hand; then came the body of the captain, whose head was almost completely severed, and he too, amid jeers and curses, was tossed over the rail. Presently Rouel appeared with a blood-stained cutlass in hand, and gave some orders to the second-mate, who at once altered the ship's course to about W.N.W., directly away from the mainland.

Some anxious minutes passed, and then Rouel came to the deck-house, and, unlocking the door, ordered the three men, with an oath, to come out and go aft. In an instant Jonas thrust the muzzle of his pistol against the ruffian's chest and shot him dead. Then he and the negroes secured the door by the inside bolt, and stood ready to fight to the death.

The fall of their leader, and the knowledge that one at least of the three imprisoned men was armed, produced a scene of confusion among the cut-throats; and then, when all three fired in succession through the port-hole at some of the Chilenos who were on the poop-deck, every one of the latter bolted below except the helmsman.

For half-an-hour Jonas and his companions were left alone, during which time the crew took in all the light sails, then went in for a carouse, for Jonas could see some of them reeling about on the deck. During this time Jonas and the negroes had broken through the sail-locker partition, dragged out several of the light sails, and made an efficient bullet-proof barricade around three sides of their part of the deck-house. Then some one with a message from the second-mate knocked at the door, and said that if they would come out no harm would be done them.

'Tell him,' replied Jonas, 'that we will fight to the last. We have readied up the sail-locker and paint-locker to set them on fire.'

The negroes were by this time mad with fear and fury combined, and were ready to do anything rather than fall into the hands of their bloodthirsty shipmates, for soon after ten o'clock they saw the dead body of the steward dragged on deck and thrown overboard. Probably he had attempted to save the captain's life, or had offended the mutineers in some way.

Soon after eight bells the wind fell light, and Jonas heard the second-mate give orders for all sail to be made again, and this order was to be the salvation of himself and his companions.

Two more anxious hours passed, and then came wild cries of alarm, as the *Chacabuco* suddenly heeled over to port, and kept on heeling.

'God help us, bo's'un!' cried one of the negroes, 'we'se turnin' turtle sure 'nuff.'

The brigantine did not turn turtle, but was thrown on her beam-ends by one of those terrific squalls common on that part of the coast. Working like madmen, the three men dragged away the pile of sails from the door, threw it open, and rushed to the weather-side. Well it was for them that the ship had not gone over to starboard, or they would never have escaped.

Many of the crew had gone overboard, and those who remained were too absolutely terrified or too drunk to do anything to save the ship, with the exception of three, who helped Jonas and the negroes to cut away the lower main and fore-rigging and then the masts. Almost as soon as the masts went the squall ceased, and the six men set to work to cut away the wreckage to leeward.

The brigantine carried three boats, but one had been carried away. The surviving mutineers, among whom was the second-mate, as soon as the ship had righted wanted to take possession of both, when the negro Gollett rushed at the officer and struck him a terrible blow with an axe, severing his right arm at the shoulder. Then Jonas and the other man went below, leaving the terrible Gollett to guard the smaller of the boats, and hurriedly got together provisions, water, and a few jars of wine.

Lowering the boat, they cast off, and paddled clear of the *Chacabuco*, leaving the mutineers (eleven in all) to shift for themselves. The land was still in sight, about fifty miles distant; but before sunset they were sighted by a small cutter carrying hides from Chiloe, and were taken on board. What became of the men left on the *Chacabuco* was never known, though Jonas heard years after that it was believed some of them reached the Chiloes.

FROM INDIA: MAY.

Oh for the land where breezes sweetly blown
Come down from heather-purple crags and moors,
That droning bees in sunshine make their own
To gather in the harvest to their doors!
Oh for the breath that blows in springtime lanes,
And rustle of light leaves in wooded dales,
The violet and the primrose, where remains
The last dead heap that fell with autumn gales;
The silver glance of many a whisp'ring wave
Among the boulders on the lakelet's shore,
The ripples of the moorhen that belave
The rushes where the timid brooks outpour;
And ancient castles crumbling stone by stone,
Whose ivy green the secret owl doth stir—
A re-embodied ghost that broods alone
With moon-like eyes and wings that have no whir.
Where many a church lies gray behind the yew
'Mid naked elms re-echoing to the cries
Of wheeling daws like whirlpools in the blue,
Now, now in England, red the sunset dies.

And here a mighty moon—framed in a space
That hath no break save in the circled plain,
Where mango-trees their foliage interlace,
And the baked earth cries out aloud for rain—
Pours out her rays and moulds the fretted palm,
Fills the sweet compound with uncertain shapes,
Ping of mosquitoes, cries of vague alarm,
From every bush where Night's dark cavern gapes.

SIXTH SERIES.

THE LITERARY ASSOCIATIONS OF DUMFRIES.

By G. M. FRASER, Librarian, Aberdeen.

We were glad to leave Dumfries, which is no agreeable place to those who do not love the bustle of a town that seems to be rising to wealth. We could think of little else but poor Burns, and his moving about on that unpoetic soil.

SO wrote Dorothy Wordsworth in her diary a hundred and six years ago, she and her illustrious brother having shaken the August dust of Dumfries from their feet after a most depressing visit. A stranger to the town does not feel quite like that nowadays. Dumfries has a bustling appearance still, though vessels from the Solway no longer lie at the King's Quay; but the dangers of present or impending wealth are, in these days, apparent only in the multitude of motor-cars that dash round every corner on the swift journey to or from the other side of the Border.

But the Wordsworths forgot, on that occasion, their own practice of being patient with nature. A day only to this marvellously interesting town and neighbourhood! It was by this haste that they missed even the most striking natural beauties of the dale. They left untraversed the left bank of the Nith, above the town, Burns's favourite haunt in the last years, whence, amid scenery of surpassing loveliness, Dumfriessians enjoy night after night sunsets that transfigure that whole region which loses itself in the shadows of the distant Galloway hills.

However, one visits Dumfries for any reason rather than for its natural beauties. These come upon you merely to accentuate its other interests. If you are a student of Scottish place-names—a study that has yet, unhappily, to be placed on a really scientific basis—you will find Nithsdale the richest centre to work upon probably in all Scotland. In the names of the district traces exist of almost every variety of people of any character who have ever had a footing in the country. And at the beginning stands a little crux in the name of the town itself, for Skene's derivation of 'Dumfries' as 'The Fort of the Frisians' seems just a little too obvious to be true. But historical study is more likely to be in view, and most people enjoy a little of that unwittingly as they visit the remarkable architectural remains: the Hadrian Wall, the vast ruin of Caerlaverock on the left bank of the estuary, or the abbey founded by the mother of Baliol on the right, or, yet again, the ruined Lincluden Abbey, which forms such a delightful afternoon walk from the town.

But, after all, as Walter Scott wrote in his diary, 'fame depends on literature, not on architecture;' and the great charm of this neighbourhood arises from its association with three great literary personages: Burns, Scott, and Carlyle. In Dumfries we seem to breathe the same atmosphere with these men; and those who visit the district with minds prepared, and are content to allow the influences to settle, as it were, will find a lasting joy gathered from even a few weeks' residence in Dumfries.

Of Burns the associations are less vivid than, say, at Ayr, or even Mauchline, which must remain the virgin soil for the true lover of Burns, as it was to the poet himself. A moment's thought will show how this is just as it should be. In the first place, although Burns wrote much of his very best work after 1788, when he entered into occupation of Ellisland, he wrote nothing of first-class excellence from inspiration drawn from the Dumfries neighbourhood, or that was not either prompted by a general poetic interest or reminiscent of his Ayrshire associations. The very first immortal verses that he wrote at Ellisland were those beginning, 'Of a' the airts the wind can blaw,' addressed with poetic longing to his love in the old home—verses which are still so misquoted in Lockhart's *Life of Burns* that only one stanza of Burns is given, and for the beautiful second stanza is substituted one of the 'additional verses' written by John Hamilton, the musicseller, of Edinburgh, who was not worthy to unloose Burns's shoe-latchet. Then, in the second place, it is to be remembered that Burns owed nothing to Dumfries. In every way he blundered in leaving Ayrshire, where alone his ardent spirit

[*All Rights Reserved.*]

was at home, and from the soil of which his genius sprang.

Yet there are many Burns associations about Dumfries that one would not willingly forgo. At Ellisland, which is a poet's farm now, as it was in his day, he had his first settled habitation in his married life; and we remember when we wander along the rough approach to the farmhouse that he actually tilled with his own hands these unsympathetic fields, as

> With modest looks,
> And clad in homely russet brown,
> He murmurs near the running brooks
> A music sweeter than their own.

We can move through the picturesque streets that knew him in the flesh, glancing at the statue which, in many respects, harmonises with the ideal; though we do not remember that with all Burns's known tenderness for the brute creation he had such an expressed fondness for dogs as to justify the inseparable companionship portrayed in this memorial. One would imagine that in this particular Scott stood supreme and alone. The Burns House, to which every one comes ultimately, must always be a little depressing. We miss all the bright surroundings of the cottage at Alloway, where also we seem to live with him in the period of promise and hope. At Mossgiel we are with him in the fullest glory of life and accomplishment, and even at Ellisland the glory has not departed. But when we come to the house in the old Mill Vennel of Dumfries the impression is beyond everything that of the squalid and unhappy close of life. We seem to have come upon just those very things that had no part in the bright earlier days, and remind us only of the dark final struggle.

But one or two redeeming features there are. The late Professor Minto used to urge, as a theory, Burns's acquaintance with prior writers; and Dr Wallace, 'Hugh Haliburton,' and others have worked the same theme. We need only to glance at the remarkable list displayed in the house, showing the quality of his little collection of books, to know Burns possessed the true literary instinct, even if we did not find it in the expression of his most natural verse. Then one looks back only with pleasure on intercourse with the late guardians of the shrine. This, indeed, was what saved the situation. In Miss Jean Armour Brown in particular, the great-granddaughter of the poet—her mother, Burns's granddaughter, being too aged to actively superintend affairs—one saw not merely the lineaments but the grave intelligence and quiet personal dignity that were so marked characteristics of the poet.

The associations of Scott with Dumfries are much less personal than those of Burns. Indeed, they are literary associations in the strictest sense, interests arising purely from the writer's imaginative creations. This is curiously illustrated in the case of the Mid Steeple, the picturesque tower that obtrudes from the middle of High Street, Dumfries, about half-way along its length. Since 1818 many thousands of people have looked on the site of the Old Tolbooth of Edinburgh, the Heart of Midlothian, remembering with affectionate interest the trials of Jeanie Deans in behalf of her sister Effie, supposed to have been imprisoned within its walls. Nobody looks with a special interest of this kind on the Mid Steeple of Dumfries, although it was here that 'Effie Deans' was actually confined and condemned, and would have been executed but for the heroic efforts of her sister. The real thing lacks the charm that was imparted to the fictitious by a touch of the magic wand.

But all around the Scott interests are sufficiently distinctive. It was a lady who resided near Lincluden Abbey that supplied Scott with an account of the events which are the framework of his famous romance. She was the wife of the Commissary of Dumfries, and had herself bought chickens at her kitchen door from the veritable 'Jeanie Deans,' otherwise Helen Walker, daughter of a farm-labourer in the neighbouring parish of Irongray. Nowadays all tourists find their way to Irongray Churchyard to look upon Helen Walker's grave, and read Scott's glowing inscription on the tombstone he provided only a year before his own death. Lockhart calls it a 'little pillar.' He must have imagined, surely, that it was a pedestal with a bust, or some upright memorial of that kind. It is in reality a flat tombstone, designed by Burn, a personal friend of Sir Walter Scott, and one of the most eminent architects that Scotland has produced; and until recent years, when it has been enclosed by a spiked iron railing, it was in danger of being carried away piecemeal.

Irongray has other interests beside Helen Walker's grave, although they are all more or less overshadowed by it. The beautiful little Norman church and the adjoining manse—in which 'A.K.H.B.' passed five years at the beginning of his ministerial life, and wrote the *Recreations of a Country Parson*, which were much more acceptable in the pages of *Fraser* than the *Sartor* of Thomas Carlyle—have for many people a special interest of their own. Then a few hundred yards farther on, in the historical grove of oaks, we have the monument erected on the spot where the martyrs suffered in the killing time. Scott never visited Irongray parish, where so many martyr memories are; otherwise he might have modified the view he expressed—for once almost brutally—to Southey when he spoke of 'the beastly Covenanters,' or when, at another time, he spoke so airily of his readiness to 'tickle ye off a Covenanter as readily as old Jack could do a young prince; and a rare fellow he is when brought forth in his true colours.' Only a few times in his full and so honourable literary life did Scott strike a jarring note; it is strange that it should have been repeatedly on the subject of the Covenanters.

But if Scott did not visit Irongray, one of his

immortal characters did. The inscription on the monument here is believed to have been the last that Old Mortality was engaged upon. Old Mortality himself sleeps in Caerlaverock Churchyard, on the other side of Dumfries. Scott was not able to discover where the old man was buried; but after Scott's death his publishers did, and themselves erected the present tombstone, with the curious epitaph:

> Why seeks he with unwearied toil
> Through death's dim walks to urge his way,
> Reclaim his long-asserted spoil,
> And lead oblivion into day?

The stone gives no indication whence the lines are taken, and few, perhaps, who read them will recollect—as an observant friend and companion who accompanied us to Old Mortality's grave did—that they are the motto-lines at the top of the preliminary chapter in *Old Mortality*. They are there ascribed to John Langhorne, better known as the translator of Plutarch, whose poetry was a possession of Scott from his boyhood. Scott was but a lad of fifteen when, on that memorable occasion, he was taken to the house of Professor Fergusson, in Edinburgh, to see Burns. He never forgot the effect produced on Burns by a picture on the wall, to which some lines were attached. Burns was affected even to tears. He asked the company present whose the lines were. 'It chanced,' wrote Scott, 'that nobody but myself remembered that they occur in a half-forgotten poem of Langhorne's called by the unpromising title of *The Justice of the Peace*. I whispered my information to a friend present, who mentioned it to Burns, who rewarded me with a look and a word which, though of mere civility, I then received, and still recollect, with very great pleasure.'

In the region of Caerlaverock Churchyard we are, of course, in the very heart of a Scott country. We need not accept the now popular view that the imposing old castle was the Ellangowan Auld Place of *Guy Mannering*—it is most unlikely; but, apart from this, interested students of Scott will be able to find various places and personages in the story pertaining to this neighbourhood. Much more is this the case with *Redgauntlet;* indeed, certain places in the district seem to be better known from their names in that novel than from their designations in the Ordnance Survey. It will be remembered, too, that Scott ventured in *Redgauntlet* on the daring step of reproducing in the character of Provost Crosbie an actual Provost of Dumfries.

Other names crowd upon us associated with Dumfries for a longer or shorter period, such as Thomas Aird, the poet, editor of the *Dumfriesshire Herald* (1835–1863), Robert Carruthers, Allan Cunningham, Patrick Miller of Dalswinton, and William Paterson, founder of the Bank of England. But we pass on to the Carlyle associations.

The Carlyle associations are quite different from those of either Burns or Scott. Only very few people as yet, probably, interest themselves to any extent in identifying actual places or personages that have become familiar—often in strange enough garb—in the pages of *Sartor Resartus*. Many of these places are to be found about Ecclefechan; but there the famous Arch House naturally absorbs attention. One is struck by the fact that about this house, and—thanks to Mr Alexander Carlyle of Edinburgh—the many really priceless mementos it contains, there is no such air of sadness as one experiences about the Burns House in Dumfries. It is due to various circumstances. It is, for one thing, the birthhouse, not the last habitation; and neither the house nor the personal relics recall any such sordid misfortunes as those amid which Burns passed away. There is no gloom in moving round to the grave, even, with its plain and appropriate stone, so different from the Burns Mausoleum.

But the remarkable thing about the Carlyle scenes in either Nithsdale or Annandale is that one still meets with so many living associations, so to speak, of Carlyle himself. Ever and again you come across even middle-aged people who, not taking any undue pride in the circumstance, recall converse, or at least respectful salutations exchanged with Carlyle on some of his later visits to his native vales. The personal memories are almost too recent and so comparatively plentiful as scarcely yet to have passed beyond the region of the commonplace. And as to these memories, we still found the impression fresh in Annandale that the Carlyles were rather a people by themselves, holding themselves, unconsciously perhaps, a little better than their neighbours. And no doubt that was true.

The closer one comes to Carlyle in this region the more does his innate strong goodness of heart appear. It was a very significant thing, as Miss Aitken, his niece, observed to us on one occasion, that each of Carlyle's relatives felt that he or she was his special favourite. There was the beautiful touch, too, in his very last days, in his recollections of his father. It was, if we remember rightly, on Carlyle's last visit to Dumfries. He was becoming very frail, and, accompanied by Miss Aitken, whose sister so devotedly cared for him after Mrs Carlyle's death, he took a drive from Dumfries by Auldgirth Bridge, a few miles out, at the building of which his father had worked as an apprentice mason. Carlyle recalled this circumstance, and when they reached the bridge he wished to get out that he might touch the stones which his father had handled. His niece tried to dissuade him, but he would get out; and, leaning on her arm, he stepped over to the parapet and passed his hand over the stones lovingly as if touching the head of a child. It is a view of Carlyle which, amid the many aspects in which he is presented to us, those who love him best will prefer to retain as a final impression.

THE HOUSE OF WHISPERS.

CHAPTER XX.—TELLS OF FLOCKART'S TRIUMPH.

'WHAT are you doing here at this hour?' Gabrielle's father demanded slowly, releasing her hand. 'Why are you prying into my affairs?' He had not detected Flockart's presence, and believed himself alone with his daughter.

The man's glance again met Gabrielle's, and she saw in his eyes a desperate look. To tell the truth would, she knew, alas! cause the exposure of her secret and her disgrace. On both sides had she suddenly become hemmed in by a deadly peril.

'Dad,' she cried suddenly, 'do I not know all about your affairs already? Do I not act as your secretary? With what motive should I open your safe?'

Without response, the blind man moved back to the open door, and, placing his hand within, fingered one of the long iron drawers. It was unlocked, and he drew it forth. Some papers were within—blue, legal-looking papers which his daughter had never seen. 'Yes,' he exclaimed aloud, 'just as I thought. This drawer has been opened, and my private affairs pried into. Tell me, Gabrielle, where is young Murie just at present?'

'In Paris, I believe. He left London unexpectedly three days ago.'

'Paris!' echoed the old man. 'Ah,' he added, 'Goslin was right—quite right. And so you, my daughter, in whom I placed all my trust—my—my only friend—have betrayed me!' he added brokenly.

'I have not betrayed you, dear father,' was her quick protest. 'To whom do you allege I have exposed your affairs?'

'To your lover, Walter.'

To Flockart, whose wits were already at work upon some scheme to extricate himself, there came at that instant a sudden suggestion. He spoke, causing the old man to start suddenly and turn in the direction of the speaker.

As the words left his lips he raised a threatening finger towards Gabrielle, a sign of silence to her of which the old man was unfortunately in ignorance.

'I think, Sir Henry, that I ought to speak—to tell you the truth, painful though it may be. Five minutes ago I came down here in order to get a telegraph-form, as I wanted to send a wire at the earliest possible moment to-morrow, when, to my surprise, I saw a light beneath the door. I'——

'Oh no, no!' gasped the girl in horrified protest. 'It's a lie!'

'I crept in quietly, and was very surprised to find Gabrielle with the safe open, and alone. I had expected that she was sitting up late, working with you. But she seemed to be examining and reading some papers she took from a drawer. Forgive me for telling you this, but the truth must now be made plain. I startled her by my sudden presence; and, pointing out the dishonour of copying her father's papers, no matter for what purpose, I compelled her to return the documents to their place. I told her frankly that it was my duty, as your friend, to inform you of the incident; but she implored me, for the sake of her lover, to remain silent.'

'Mr Flockart!' cried the girl, 'how dare you say such a thing when you know it to be an untruth; when'——

'Enough!' exclaimed her father bitterly. 'I'm ashamed of you, Gabrielle. I'——

'I would beg of you, Sir Henry, not to further distress yourself,' Flockart interrupted. 'Love, as you know, often prompts both men and women to commit acts of supreme folly.'

'Folly!' echoed the blind man. 'This is more than folly! Gabrielle and her lover have conspired to bring about my ruin. I have had suspicions for several weeks; now, alas! they are confirmed. Walter Murie is in Paris at this moment in order to make money out of the secret knowledge which Gabrielle obtains for him. My own daughter is responsible for my betrayal!' he added in a voice broken by emotion.

'No, no, Sir Henry!' urged Flockart. 'Surely the outlook is not so black as you foresee. Gabrielle has acted injudiciously; but surely she is still devoted to you and your interests.'

'Yes,' cried the girl in desperation, 'you know I am, dad. You know that I'——

'It is useless, Flockart, for you to endeavour to seek forgiveness for Gabrielle,' declared her father in a firm, harsh voice. 'Quite useless. She has even endeavoured to deny the statement you have made—tried to deny it when I actually heard with my own ears her defiant declaration that she was prepared to bear her shame and all its consequences! Let her do so, I say. She shall leave Glencardine to-morrow, and have no further opportunity to conspire against me.'

'Oh father, what are you saying?' she cried in despair, bursting into tears. 'I have not conspired.'

'I am saying the truth,' went on the blind man. 'You and your lover have formed another clever plot, eh? Because I have not sight to watch you, you will copy my business reports and send them to Walter Murie, who hopes to place them in a certain channel where he can receive payment. This is not the first time my business has leaked out from this room. Only a short time ago certain confidential documents were offered to the Greek Government, but fortunately they were false ones prepared on purpose to trick any one who had designs upon my business secrets.'

'I swear I am in ignorance of it all.'

'Well, I have now told you plainly,' the old man said. 'I loved you, Gabrielle, and until this moment foolishly believed that you were devoted to me and to my interests. I trusted you implicitly, but you have betrayed me into the hands of my enemies—betrayed me,' he wailed, 'in such a manner that only ruin may face me. I tell you the hard and bitter truth. I am blind, and ever since your return from school you have acted as my secretary, and I have looked at the world only through your eyes. Ah,' he sighed, 'but I ought to have known! I should never have trusted a woman, even though she be my own daughter.'

The girl stood with her blanched face covered by her hands. To protest, to declare that Flockart's story was a lie, was, she saw, all to no purpose. Her father had overheard her bold defiance, and had, alas! most unfortunately taken it as an admission of her guilt.

Flockart stood motionless but watchful; yet by the few words he uttered he succeeded in impressing the blind man with the genuineness of his friendship both for father and for daughter. He urged forgiveness, but Sir Henry disregarded all his appeals.

'No,' he declared. 'It is fortunate indeed, Flockart, that you made this discovery, and thus placed me upon my guard.' The poor deluded man little dreamt that on the occasion when Flockart had taken him down the drive to announce his departure from Glencardine on account of the gossip, and had drawn Sir Henry's attention to his hanging watch-chain, he had succeeded in cleverly obtaining two impressions of the safe-key attached. In his excitement, it had never occurred to him to ask his daughter by what means she had been able to open that steel door.

'Dad,' she faltered, advancing towards him and placing her soft, tender hand upon his shoulder, 'won't you listen to reason? I assure you I am quite innocent of any attempt or intention to betray you. I know you have many enemies;' and she glanced quickly in Flockart's direction. 'Have we not often discussed them? Have I not kept eyes and ears open, and told you of all I have seen and learnt? Have'——

'You have seen and learnt what is to my detriment,' he answered. 'All argument is useless. A fortnight or so ago, by your aid, my enemies secured a copy of a certain document which has never left yonder safe. To-night Mr Flockart has discovered you again tampering with my safe, and with my own ears I heard you utter defiance. You are more devoted to your lover than to me, and you are supplying him with copies of my papers.'

'That is untrue, dad,' protested the girl reproachfully.

But her father shook her hand roughly from his shoulder, saying, 'I have already told you my decision, which is irrevocable. To-morrow you shall leave Glencardine and go to your aunt Emily at Woodnewton. You won't have much opportunity for mischief in that dull little Northampton village. I won't allow you to remain under my roof any longer; you are too ungrateful and deceitful, knowing as you do the misery of my affliction.'

'But, father'——

'Go to your room,' he ordered sternly. 'To-morrow I will speak with your mother, and we shall then decide what shall be done. Only, understand one thing: in the future you are not my dear daughter that you have been in the past. I—I have no daughter,' he added in a voice harsh yet broken by emotion, 'for you have now proved yourself an enemy worse even than those who for so many years have taken advantage of my helplessness.'

'Ah, dad, dad, you are cruel!' she cried, bursting again into a torrent of tears. 'You are too cruel! I have done nothing.'

'Do you call placing me in peril nothing?' he retorted bitterly. 'Go to your room at once.—Remain with me, Flockart. I want to speak to you.'

The girl saw herself convicted by those unfortunate words she had used—words meant in defiance of her arch-enemy Flockart, but which had placed her in ignominy and disgrace. Ah, if she could only stand firm and speak the ghastly truth! But, alas! she dared not. Flockart, the man who held her in his power, the man whom she knew to be her father's bitterest opponent, a cheat and a fraud, stood there triumphant, with a smile upon his lips; while she, pure, honest, and devoted to that afflicted man, was denounced and outcast. She raised her voice in one last word of faint protest.

But her father, angered and grieved, turned fiercely upon her and ordered her from his presence. 'Go,' he said, 'and do not come near me again until your boxes are packed and you are ready to leave Glencardine.'

'You speak as though I were a servant whom you've discharged,' she said bitterly.

'I am speaking to my enemy, not to my daughter,' was his hard response.

She raised her eyes to Flockart, and saw upon his dark face a hard, sphinx-like look. What hope of salvation could she ever expect from that man—the man who long ago had sought to estrange her from her father so that he might work his own ends? It was upon her tongue to turn upon him and relate the whole infamous truth. Yet so friendly had the two men become of late that she feared, even if she did so, that her father would only see in the revelation an attempt at reprisal. Besides, what if Flockart spoke? What if he told the awful truth? Her own dear father, whom she loved so well, even though he had misjudged her, would be dragged into the mire. No, she was the victim of that man, who was a past-master of the art of subterfuge; the man who, for years, had lived by his wits and preyed upon society.

'Leave us, and go to your room,' again commanded her father.

She looked sadly at the white, bespectacled countenance which she loved so well. Her soft hand once more sought his; but he cast it from him, saying, 'Enough of your caresses! You are no longer my daughter! Leave us!' And then, seeing all protest in vain, she sighed, turned very slowly, and with a last, lingering look upon the helpless man to whom she had been so devoted, and who now so grossly misjudged her, she tottered out, closing the door behind her.

'Has she gone?' asked Sir Henry a moment later.

Flockart responded in the affirmative, laying his hand upon the shoulder of his agitated host, and urging him to remain calm.

'That 's all very well, my dear Flockart,' he cried; 'but you don't know what she has done. She exposed a week or so ago a most confidential arrangement with the Greek Government, a revelation which has involved me in the loss of over a hundred thousand.'

'Then it 's fortunate, perhaps, that I discovered her to-night,' replied his guest. 'All this must be very painful to you, Sir Henry.'

'Very. I shall not give her another opportunity to betray me, Flockart, depend upon that,' the elder man said. 'My wife warned me against Gabrielle long ago. I now see that I was a fool for not taking her advice.'

'Certainly it 's a curious fact that Walter Murie is in Paris,' remarked the other. 'Was the revelation of your financial dealings made in Paris, do you know?'

'Yes, it was,' snapped the blind man. 'I believed Walter to be quite a good young fellow.'

'Ah, I knew different, Sir Henry. His life up in London was not—well, not exactly all that it should be. He 's in with a rather shady crowd.'

'You never told me so.'

'Because you did not believe me to be your friend until quite recently. I hope I have now proved what I have asserted. If I can do anything to assist you I am only too ready. I assure you that you have only to command me.'

Sir Henry reflected deeply for a few moments. The discovery that his daughter was playing him false caused within him a sudden revulsion of feeling. Unfortunately, he could not see the expression upon the countenance of his false friend. He was wondering at that moment whether he might entrust to him a somewhat delicate mission.

'Gabrielle shall not return here,' her father said, as though speaking to himself.

'That is a course which I would most strongly advise. Send the girl away,' urged the other. 'Evidently she has grossly betrayed you.'

'That I certainly intend doing,' was the answer. 'But I wonder, Flockart, if I might take you at your word, and ask you to do me a favour? I am so helpless, or I would not think of troubling you.'

'Only tell me what you wish, and I will do it with pleasure.'

'Very well, then,' replied the blind man. 'Perhaps I shall want you to go to Paris at once, watch the actions of young Murie, and report to me from time to time. Would you?'

A look of bright intelligence overspread the man's features as a new vista opened before him. Sir Henry was about to take him into his confidence! 'Why, with pleasure,' he said cheerily. 'I 'll start to-morrow, and rest assured that I 'll keep a very good eye upon the young gentleman. You now know the painful truth concerning your daughter—the truth which Lady Heyburn has told you so often, and which you have never yet heeded.'

'Yes, Flockart,' answered the afflicted man, taking his guest's hand in warm friendship. 'I once disliked you—that I admit; but you were quite frank the other day, and now to-night you have succeeded in making a discovery that, though it has upset me terribly, may mean my salvation.'

(To be continued.)

PURE MILK.

IT is not so many years since milk was recognised as a fluid of potential danger. In the course of time the general public have come to recognise this danger, as witness the articles on the subject in the *Daily Mail* last summer, and the lengthy discussion which followed; and repeated calls have been made on successive Governments to introduce legislation for the improvement of the trade.

It is an open secret that Mr John Burns is preparing a Pure Milk Bill to deal with the subject, which will be introduced shortly. What its main provisions will be is a subject for speculation; but after examining existing legislation, and noting the views of leading sanitarians and health officials, we think that certain of its leading sections, or what ought to be its leading sections, can safely be predicated.

It may be profitable here to indicate the chief dangers to be apprehended from milk.

As is well known, milk is a frequent vehicle for conveying scarlet-fever infection. The usual story to be got on investigation is that for some days the milker has had a sore throat and has been out of sorts, but has complained in no other way. On medical examination, the worker is shown to be a victim of scarlet-fever, and the source of infection to various homes, perhaps the origin

of a quite considerable epidemic. Such epidemics spread like wildfire. Wherever infected milk is delivered cases will crop up, and in a few days the medical officer of health may have a couple of hundred cases on his hands. The fact that the infected households have a common dairy attracts his attention to it. Isolation of the patient and the closing of the dairy follow, and the epidemic subsides.

Diphtheria is carried in identical fashion, though it is a matter of public interest, as indicating the need for periodic veterinary inspection of cattle, that one medical officer of health showed that cows can harbour the bacilli of diphtheria and be the origin of an epidemic. He found sores on the teats of the cows from which he was able to isolate the dreaded organisms.

Not a few typhoid epidemics have been traced to milk as the cause or source of the trouble. In these cases the milk-cans have been swilled out with water contaminated by typhoid organisms. Milk is for them an excellent environment, as indeed it is for all organisms, in which they thrive and multiply; in due course they reach the consumer, to his misfortune. Now, water contaminated by typhoid is never certified as suited for human consumption. It is obvious, therefore, that the farm from which the milk has come has had an unsatisfactory water-supply, or the farmer has used other and dangerous water for cleansing his cans.

Tuberculosis is also a danger to the consumer of milk. The public are beginning to realise this, and nothing will prove a stronger lever in their hands than this with which to move the Government to action. Consumption is so widely spread, it is the dread of so many homes, it is the fatal sickle to so many lives, that we may expect a unanimous appeal for deliverance from it. It is estimated that 20 per cent. of the cows in this country are tuberculous; and various towns have shown that from 8 to 20 per cent. of samples taken from milk coming into the town have been infected with tuberculosis. It is when the udder is tuberculous that the chief danger arises; and there are regulations and bylaws prohibiting the sale of milk from cows so affected, but the fact that such milk is still to be found offered for sale indicates that these regulations are a failure. As every sanitarian knows, this is due to inefficient inspection of cows and dairies, which will almost certainly be rectified in any new Act.

One cannot pass from this subject without referring to the great contributing cause to the infantile mortality of our large towns—enteritis or summer diarrhœa of infants. Every summer, but more especially in the hot summers with long periods of high temperature, large numbers of infants are carried off by this disease. A child, apparently quite well, is suddenly taken ill and dies in a day or two, often in a few hours. Bottle-fed babies are the victims. Milk, always a suitable medium for organisms, in hot weather simply teems with life in a few hours after milking, and the dangerous ones in this case are borne to it by the common house-fly, as has been shown recently in Liverpool. In the slums of our large towns these pests are ubiquitous and easily infect the milk, which is often left carelessly exposed.

It is obvious from what has been said that the dangers of the milk-consumer are many and various, and that the milk-question is one of urgent national importance. The direst enemy of the white race—tuberculosis—is spread by infected milk; and in these days of a declining birth-rate we cannot afford to lose annually such large numbers of our infant population.

How, then, can we have pure milk? Milk we must have. It is the ideal food for babies, for invalids, for all, when it is pure. But there must be no risks run. The cow must be healthy. It must not be tuberculous; at any rate it must not have tuberculous udders. By careful inspection we are protected from tuberculous meat. In the same way we must be saved from tuberculous milk. Of course the percentage of affected cattle in a herd is high; but the nation must be prepared to make sacrifices if it would secure immunity. This can only be done by ruthlessly slaughtering an infected animal whenever the disease is discovered. It has been done in various large herds in Denmark, and it must be done here.

And efforts must be made to keep the cow healthy. To this end it must have a suitable shed, with sufficiency of light and space, with proper drainage, and a proper water-supply. These must be of a Government-approved standard and subject to inspection by competent men.

The milk must be secured in cleanly fashion, received into clean, surgically clean, pails, and the workers must be clad in clean overalls. The milk must be stored in a clean place, kept cool, and free from dust and from invasion by flies. It must be conveyed in closed vessels, and so also exposed for sale in shops, not in open bowls.

From cow to customer cleanliness is the order of the day. Large dairy companies have carried this principle to a high state of efficiency. The cows' teats are cleansed, and the milking is then done by machinery. At once the milk is stored in a refrigerator, for cooling prevents the multiplication of organisms. The milk reaches the consumer in sealed bottles. In this way safety is assured. But such enlightened methods are far beyond the purse of the man in a small way of business, did he wish to practise them.

All the regulations necessary for securing a good milk-supply are already law. Why they fail will be shown later, but we must first give the milk-producer's point of view. It may be said at once that in the vast majority of cases neither the steadings, water-supplies, dairies, nor workpeople satisfy the requirements of health. An enormous amount of structural alteration would be required before

satisfactory ventilation, space, and drainage could be secured, and that would mean expense. Nor are the workers drawn from a class who fully appreciate cleanliness, and the owner will tell you that it is increasingly difficult to get the type of man he desires. The regulations at present in force are the minimum necessary to secure us a safe milk-supply if they were carried out; but the milk-farmer considers them impracticable, and a great sanitary authority has recently said that it will be many years before we can hope to have the conditions necessary to secure us a safe and satisfactory supply.

What, then, are we to do? We must make the best of a bad business. What is the *viâ media* by which we may hope to escape? Undoubtedly the *dernier ressort* in this case is sterilisation or pasteurisation. In the former the milk is boiled and all organisms are killed. In the latter it is heated up to a temperature of sixty-five to seventy degrees centigrade for twenty minutes, and then rapidly cooled to about seven degrees centigrade. This method is perhaps the more preferable, for the milk has not that boiled taste which makes it so unpalatable, though it is not so safe if kept for some time. Used the same day, it is perfectly safe —much better, indeed, than the finest of ordinary milk to which any doubt is attached. Various forms of apparatus for pasteurisation are on the market, and many of them are eminently satisfactory. This method of securing safety is, however, quite impracticable for the poor consumer, on whom the incidence of milk-borne diseases chiefly falls. The only alternative seems to be the institution of municipal milk-bureaus on a large scale.

As has been already indicated, the existing milk-regulations are satisfactory. If carried out they would secure much that the sanitarians desire and the farmers consider ideal and impracticable. Why, then, do they fail? The chief provisions for the control of the milk-trade are to be found in the Public Health Acts, the Food and Drugs Act, the Dairies, Cowsheds, and Milk-shops Orders, and the Sale of Milk Regulations. Here, again, is an example of the truth of the old adage which says that 'too many cooks spoil the broth.' One Act deals with the quality of the milk, another with the cows and cowsheds, and a third with the conditions governing the sale of milk. What the milk-trade needs is a comprehensive Act, including all the provisions of other Acts dealing with milk. As things are the wary adulterator has limitless legal loopholes of escape from punishment, and sanitary authorities often find the greatest difficulty in securing a conviction. A single Milk Act would obviate this, would make uniform regulations for the entire country, and give health officials a much firmer control of the trade.

The orders are unfortunately only adoptive. This means that it is left to the discretion of each authority whether it will take advantage of them or not, and many sanitary officials have found the greatest difficulty, especially in rural districts, in persuading the authorities to adopt them. It is obvious that these orders would be most inconvenient for the unsatisfactory milk-producer, and his influence has often been strong enough to prevent their adoption. It is another case of a fight against vested interests. But even when they are adopted, the Local Government Board, under whose jurisdiction the administration of these Acts lies, has no power to compel a recalcitrant local authority to do its duty.

Then, again, the official responsible for the supervision of the regulations is the medical officer of health, and not infrequently has he suffered for his temerity when he has attempted to enforce them. In England his appointment is an annual one, and too often vested interests have been his undoing. He has had the option of winking at things or losing his appointment. What some authorities want is a man who will put his blind eye to the end of the telescope—in a bad cause. Reform is urgently wanted here, for until the medical officer can perform his duties without fear or favour there will always be inefficiency. The sanitary official must have security of tenure, subject of course to good behaviour and work done. Men are usually chary of risking 'bread and butter' by flouting their employers; but the medical profession is proud to possess men who have dared to do so in the cause of duty, and who have suffered in consequence. A glaring case which occurred last year is still in the public memory.

Another important cause of failure is the way the hands of the great milk-consumers, the large city authorities, are tied. These authorities are carrying out the regulations—which it is to their interest to do—to the best of their ability. Now, the orders give power to an authority to examine cows, cowsheds, and the workpeople connected with them. If suitable cause is shown, such as tuberculosis of the udder or foot-and-mouth disease in the cow, unsuitable or insanitary steadings, or disease of an infectious nature in a worker, the milk-supply can be stopped until the conditions required by the regulations obtain. All this is admirable; but here comes the fallacy. It must be remembered that large towns draw much of their supply from rural districts outside their own administrative area. Now, the orders give no power to an authority to cross its own borders for purposes of inspection and interdict unless and until milk from such an area can be shown to have produced disease within its administrative area, the moral being always shut the stable door after the horse has escaped! Happily, certain large towns—Liverpool and Manchester, for example—have private Acts granting them larger powers, by which this difficulty is obviated.

It may be laid down as an axiom that success depends on efficient inspection, and this will never be obtained until an inspector can trace to its source milk coming to the town where he is located.

Some of these grievances will, doubtless, be removed by the new Act, which, we may suggest, should contain, among others, the following provisions: (1) Dairies, Cowsheds, and Milk-shops Orders to be incorporated with the Food and Drugs Act and other Acts and regulations dealing with milk. (2) The Dairies, Cowsheds, and Milk-shops Orders to be compulsory, and the Local Government Board to have power to compel an authority to carry out their provisions. In the event of failure to do the duty itself, the recalcitrant authority to bear all expense connected therewith. (3) Frequent inspection by medical, veterinary, and other inspectors, on warrant if necessary, of any source of milk-supply to their administrative area. (4) Inspectors to have security of tenure. (5) Notification of tuberculosis in the cow to be compulsory, with fine in event of failure to comply with this provision. (6) Frequent analysis of milk samples by qualified analyst.

Even now the last word has not been said, for much must be done in the way of training those connected with the milk-supply to a greater degree of cleanliness, and this legislation cannot do. The same must also be done in the home. The best of milk will become dangerous when one remembers the reckless way in which it is stored in many homes. By leaving it uncovered, on a kitchen table, exposed to dust and foul odours, the consumer invites disaster which cannot be laid at the milkman's door. Fortunately progress is being made in this direction by means of lady health-visitors and lay workers, and by the lately introduced teaching of hygiene in schools, so that much may be hoped for in the time to come. In the meantime, while we press towards the ideal, pasteurisation is safe.

THE SEQUEL OF A TRAGEDY.

PART II.

FRANK was not gone more than a few minutes, and after refreshing himself with a tumbler of iced lemonade he began to read what had remained unread by any eyes save his own since it was penned eighty odd years before:

'I, Archibald Seymour Basildon, late colonel of His Majesty's Sixty-fourth Dragoons, formerly of Belle Joie, in the county of Devon, and latterly of Nethercroft, in this vicinity, finding myself in a grievous strait from which there seems no possible deliverance, have determined to employ my short remaining time in drawing up a statement, which, sooner or later, will doubtless be found and made public, of how I happen to be in this place, of my amazing discovery here, of certain occurrences since my arrival, and of my reasons for believing that I shall die a prisoner here. In doing this I am actuated by one motive only—the hope that some day the truth with regard to sundry matters may become known to those of my name who may follow me, and to such others as it may concern.

'Five days since—or it may be six, for my watch has stopped and I have lost count of time—my wife eloped with young Caslin of Pearmount, whose father is a neighbour of mine. It has since come to my knowledge that they were in the habit of meeting when I was from home, but no faintest suspicion that such was the case ever clouded my mind. I loved Clarice with the jealous, consuming passion of a man mated to a beautiful creature less than half his own age; and she, with the inborn craft of her sex, contrived to cozen me into the belief that my passion was reciprocated in a measure nearly as full as my own. Oh, what a blind fool I must have been! How she and her lover must have made merry times without number over "Black Basildon's" mad infatuation for a woman young enough to be his daughter, who did not care a button for him in return!

'When the news of the elopement was told me I had a fit of some sort—from which, however, I presently recovered. I at once offered a reward to any one enabling me to trace the fugitives; but I was not popular in the neighbourhood, and nobody came near me. Within a few hours of Clarice's flight I missed the casket containing the jewels which had belonged to my first wife. If she had not taken them, who had? She alone knew where the duplicate key of the strong-room was kept. The jewels were worth fifteen thousand pounds at the least, and Caslin was as poor as a church-mouse. Could it be proved that he was merely an accessory after the fact, he had rendered himself liable to transportation for life; on the other hand, could it be shown that he was the instigator of the theft, the gallows, were he caught, would be his doom. But could I have got my grip on his throat I would have saved the hangman his trouble!

'I have always been fond of the sea, and from the date of taking up my abode at Nethercroft my one recreation has been to go out on it alone, in a tiny skiff which I could handle without help. On the afternoon of the fifth day after the elopement, tired of staying indoors waiting for the news which failed to come, I walked down to the cove where my skiff was moored, got into it, set the one sail, and drew out from the land. There was a light breeze, and the tide was rolling lazily in. I sailed on, heedless of the direction, and thus it happened that before long I found myself closer inshore than I was in the habit of going, and opposite the entrance to the so-called Nun's Cavern, where,

centuries ago, a ghastly tragedy is said to have been enacted, with the result that the place has the reputation of being haunted, and is shunned by the superstitious natives for miles around. I had heard of it, but had never been curious enough to explore it; now, however, I determined to do so.

'The cavern can only be entered in safety at certain states of the tide. This was known to me, and to-day the opportunity was ready to my hand. Five minutes later I ran my boat up the shelving floor and landed. The place was not nearly so dark as I had thought to find it, for in addition to the light which reached it through the entrance, a fissure in the roof which split the heart of the cliff allowed a thin filter of daylight to penetrate from above.

'The place held nothing save four heavy chests, considerably battered and looking old enough to date back to the time of the Armada, one of the ships of which, according to tradition, was wrecked in the bay outside. At a later period the cavern was probably a haunt of the smugglers who abounded on this part of the coast. Not without difficulty I succeeded in lifting up the lids of two of the chests sufficiently far to show me that they were empty. Resting on the third was a much smaller chest; this too I opened, and peered into it. Next moment the lid fell with a crash, and I started back with a cry of amazement. Inside it was the stolen casket!

'But were the jewels still in it, or had they been abstracted? In another minute the question was answered. The casket felt heavy to my hand as I lifted it out. By the light that percolated through the fissure in the roof I examined its contents. So far as my recollection of the different articles went, not one of them was missing.

'I sat down on one of the chests to consider the problem involved by my finding of the casket. By whom, and for what purpose, had it been brought there? How long a time would elapse before it was fetched away by the person or persons who had selected so singular a hiding-place for their booty? Had I been right in assuming that there was an intimate connection between the elopement and the robbery? Was it due to anything more than a coincidence that the discovery of the one was made within three hours of the discovery of the other?

'Such were some of the queries I put to myself as I sat there. Then all at once a death-like faintness began to creep over me. I had had two similar seizures six months previously, but I had begun to hope that after so long a time I should escape a recurrence of them. The hope had proved fallacious. The faintness enveloped me like an impalpable cloud charged with some subtle anæsthetic. My physical powers seemed frozen at their source. I could not have moved a finger to save my life. The normal pulsation of my heart had dwindled to a feeble flutter; presently unconsciousness supervened.

'It was night when I came to myself. Hours had passed, but how many I had no means of judging. The cavern would have been in darkness but for a faint reflection which penetrated it from the shining silvery track on the bay outside, for the moon was nearly at full. Some little time was needed to pull my scattered wits together, and to bring to mind where I was and how I came to be here. Presently I put forth a hand, groped for the casket, and found it.

'I had just decided that it would be wiser to wait till sunrise before venturing to leave the cavern, when the trail of moonlight outside was cut in two by something black which came suddenly into view some thirty or forty yards from the entrance. Next minute I made out that the object in question was a boat containing two persons, one of whom was pulling a pair of oars, the other being seated in the stern. The boat's head had been turned, and it was now clear that the rower was making straight for the cavern. I rose to my feet and stood staring as if fascinated. What purpose save one could bring anybody to such a place at that hour? They were coming to fetch away the casket hidden a few days before!

'A little way outside the entrance the rower shipped his oars. A few seconds later a clear light streamed forth from a lantern fixed in the bow, more than enough to outline the narrow channel between the rocks which guard the entrance to the cavern. The boat was now propelled slowly forward towards the floor of shelving sand.

'But before the rower landed I retreated farther into the cavern, taking with me the casket and my pistols. At some bygone date a portion of the roof had fallen, behind which I now ensconced myself and waited. I could see without being seen.

'After landing, the man said something to his companion, and then, carrying the lantern, he made straight for the chests. On reaching them he put down his lantern, lifted the lid of the small chest, and thrust one hand in up to the elbow. An instant later he withdrew it and staggered as if some one had aimed a blow at him.—"Gone!—gone!" he cried. "What villain has been at work here?"—"What's amiss, Hugh dear? Surely you don't mean that the casket has vanished?"

'The voice that spoke from the boat was my wife's voice! On the instant a vertigo seized me, and I had to grip the rock in front of me to keep from falling. There was a dull buzzing in my ears, and what Caslin replied I know not. But the vertigo passed, leaving my brain as clear and sane as it is at this moment.

'When next I looked my wife was in the act of stepping out of the boat, while Caslin was staring at the empty chest like a man in a stupor. Grasping a pistol in my right hand, I emerged into the open, advanced a few steps, and then halted, standing full in the lantern-light. My wife was the first to perceive me, and as her piercing shriek rang through the cavern her limbs gave way and she sank to the earth. Caslin started and turned, and

when his eyes met mine his face became as a bloodless mask, frozen into an expression of the most abject terror. The fellow was a coward through and through.

'It boots not to recall what I said to him. My words were few but to the purpose. Neither reproach nor invective passed my lips. I would afford him a chance for his life if he chose to avail himself of it. In other words, it must be a duel to the death between us. He should have his choice of my pistols, I would measure a space of a dozen yards, my repeater would strike the hour in less than five minutes, and at the first stroke we would fire together.

'No word issued from his lips in reply, and when I offered him his choice of pistols he took one in silence; but into his eyes there had come an expression which had not been there three minutes before. After arranging the lantern so that its light would be available for what was about to follow, I began to measure the distance that was to separate us. I had paced it one way, and had turned to repace it so as to make sure I had counted aright; my back was towards Caslin; there was a flash, followed by a report, and a bullet whistled past my ear. On the instant I swung round and confronted him. His hand, holding the smoking pistol, hung limply by his side. He stood there panting hard, with contracted lips and bared teeth, his brow damp with sweat. He read his doom in my eyes, and as he stared into them a film overspread his own. Fright had paralysed his brain. A few moments more and he would sink unconscious to the ground. Slowly I lifted my arm and fired straight at his heart. His hand went quickly up to where the bullet had struck him; he spun half-round, drew a deep, gurgling breath, and fell on his face dead.

'Following close on my shot, a second shriek shivered the silence. Dropping my pistol, I strode to where my wife lay, a senseless heap, on the ground. Lifting her, I carried her to the boat and laid her on the cushions in the stern. By that dim light her sweet, false face looked as if carved out of alabaster, with the mesh of her golden hair tangled about it as I had seen it many a time in her sleep. My heart was heavy as lead as I bent over her for the last time. To my morbid humour it seemed as if one of those derisive smiles I remembered so well curved her unconscious lips and lurked behind her half-open lids.

'Then I went back to her dead lover, and, lifting his body—for just then I seemed gifted with the strength of two men—I carried it to the boat and laid it in the bow. Then I pushed the boat down to the water. The tide was ebbing, and the current would carry it away without other agency. How long I stood there watching it being borne slowly along the track of moonlight I know not, but at length a cross-current took it and swept it out of my range of vision. Just before losing sight of it I saw my wife raise herself into a sitting posture and a moment later fling up her arms. Her dead lover lay at her feet. Together they were going out to sea.

'A few minutes later I made a discovery which sent a chill of horror through me. My skiff was gone, and with it my sole means of exit from the cavern! I could only conclude that I had not dragged it far enough out of reach, and that the pull of the ebb-tide had swept it out into the bay. Such was the effect of the discovery upon me that the same death-like faintness again laid hold of me, and everything became a blank.

'When next I opened my eyes it was as broad daylight in the cavern as ever reaches here. Outside, the waves were dancing in brilliant sunshine, and the cleft in the roof was pierced by a shaft of white light as though it were a celestial staircase up which a dead man's soul might climb to realms above.

'Seated on one of the chests, for the next half-hour I held commune with myself. By the end of that time I had schooled myself to look my fate steadily in the face. There was no hope either of escape or rescue. Not a creature would know where to look for me. The Nun's Cavern was destined to be my tomb.

'And so presently I determined to write out and leave behind me a brief record of all that—— Ah, the faintness again! What remains to be written must be left till'——

Frank Basildon laid the mildewed leaves on the table and looked across at Northfield. 'That is all,' he said gravely. 'There the manuscript ends. One can but suppose, and indeed hope, that the writer did not recover from that last attack of syncope, for surely it were preferable to fade painlessly out of existence rather than die a lingering death of slow starvation.'

After a space of silence Northfield said, 'But what became of the boat containing the faithless wife and her slain lover?'

'It was picked up about thirty miles out at sea, but not till a day and a night had passed. What she had gone through had turned Mrs Basildon's brain. When found she was crooning softly to herself, with her lover's head on her lap; and a few years later she died in an asylum.'

'And the jewels? You collared them, of course.'

Frank smiled. 'Both legally and morally they were my property, and, as you phrase it, I collared them. The proceeds of the sale of about three-fourths of them enabled me to marry long before I should otherwise have been in a position to do so. John Fildew was desirous of joining a son in Australia, so I paid the passage out of himself and wife, and made him a liberal present into the bargain. That's my wife's bell. She's ringing for us to join her and Bessie at the tea-table.'

THE END.

IMPRESSIONS OF ALGERIA.

By Captain P. L. OLIPHANT.

PART II.—THE COUNTRY.

IN the immediate neighbourhood of the town of Algiers the country is hilly, and the red, crumbling rock crops out of the hillside in bluffs and peaks and jagged spurs. Between this barren framework the red, loamy clay has been turned up by the plough or planted with groves of eucalyptus or pines. Every corner where the rich soil lies deep upon the substratum of rock has been put to use, here as a market-garden for early vegetables, which are exported to the northern shores of the Mediterranean; there as a vineyard or orchard of orange and lemon trees. There is very little grain grown in the district, the greater part of the land being given up to the cultivation of the grape. Since the appearance of phylloxera among the vines in the south of France the vineyards of Algeria have greatly extended; for the pest is unknown here, and the quality of the wine made from the Algerian vineyards is excellent. The industry is almost entirely in the hands of French and European proprietors, and a few miles to the south-west of Algiers is to be seen a mournful memorial of a community which a few years ago occupied a leading position in the cultivation of the grape and the manufacture of wine. It is the deserted monastery of La Trappe. To-day we can pass beneath the outer gate (with its confident inscription, 'Janua Cœli') and explore the deserted altars and the empty dormitories unchallenged. The silence of the silent Brotherhood has become the silence of desolation. A decrepit old man, who respects neither the shrines nor the traditions which still cling to the place, conducts the visitor over the empty galleries without emotion. He cannot understand why the traveller should concern himself with such things; but he is all anxiety to show him the four thousand hens in the neighbouring yards, and the cows in the byres, and the big vats where the wine is still made, and to pocket his gratuity when he ushers him once more through the outer gate. The story of the monks of La Trappe in Algeria is the story of all the religious orders in France and her dependencies. It was decreed that they must go; and, in anticipation of expulsion from their home and the vineyards of the African coast, the monks of La Trappe sold their possessions and their business, and betook them to a land where toleration is extended to religious orders of the Church of Rome.

In the springtime the fields and hedgerows are carpeted with wild-flowers—arum and asphodel, and tall yellow flowering fennel, and humbler blossoms, marigold and blue iris, nestling thick and low between the rows of vines which are putting out the first tender green leaves from their pruned stems. A mixed team of oxen and mules dragging a plough down the drills cuts short their tender existence, leaving only a ridge and furrow of red earth behind them. By the roadside are hedgerows of yellow mimosa and thickets of gleaming-white thorns of Calvary, and aloes and cactus in the rough places. The villages are, for the most part, the habitations of French settlers; but here and there a collection of Arab huts roofed with alfa grass, or a Kabyle hamlet, or the tomb of a marabout, or the dome of a tiny mosque serves to remind us that we are strangers in a strange land.

Now, if we take the train and travel eastwards towards the province of Constantine, we shall see how great a variety of scenery lies within the narrow compass of the Tell—the strip of land between the coast and the mountains to the south; how sudden the changes from glowing fertility to arid wastes, and from wastes to fertility. At first it is a land of corn and wine, with alternating plantations of vines and wheat, backed by the rugged heights of the Djurjura Mountains. One has not to travel far before realising that Frenchmen ought not to be trusted with trees. The beautiful groves and rows of eucalyptus which border the railway have been hacked and distorted until their poor mutilated trunks have lost all semblance of their former stately grace. For what reason were they planted, one asks one's self, if so soon as they attain to maturity they are to be lopped and chopped until they are nothing but a disfigurement?

Now we are passing through a district peopled by immigrants from Alsace and Lorraine—Frenchmen who would not tolerate the German yoke, who preferred to remove themselves and their families to Algeria and begin life anew under the ægis of their own nation. Their neighbours in the Djurjura Mountains are no less lovers of freedom than the Alsatians. They are Kabyles—the old, aboriginal inhabitants of the land, who have been driven by successive invasions to the fastnesses of the mountains, always clinging to their racial distinctions, always the last to be brought into subjection by the invaders. It may be that they are of Phœnician origin; it is certain that they have an admixture of Greek, Roman, and Teutonic blood. At the time of the Arab invasion the Kabyles were Christians and far advanced in civilisation. Driven to the mountains, they retained their independence, but embraced the Mohammedan religion. Curiously enough, they still keep their Sabbath on Sunday, not on Friday as other Mohammedans do. Kabyle women are in a better position than Arab women, having far more freedom; nor are they required to veil their faces. Many of the Kabyles show traces of the Teutonic

blood in them in fair skins and gray eyes. The rough, barbaric ornaments which they wear are interesting and sometimes beautiful. The workmanship consists of enamel laid on silver, embellished with coral and stones found in the mountains. Unlike the Arabs, the Kabyles build their houses with tiled, gabled roofs. They are a democratic community, recognising no aristocracy, intensely suspicious of the European invaders, and independent, as hillmen invariably are.

A few hours' journey from Algiers the mountain-ranges on either side begin to close in upon the narrow railway track, and the train enters the beautiful gorge of the Isser, and skirting the precipitous hillside, emerges at last on a fair valley which might almost be a strath in Perthshire but for the nature of the wild vegetation and the yellow-ochre tint of the rugged peaks. Then we reach Palestro, where in the rising of 1871 the Kabyles attacked and murdered many of the settlers and the working-party on the railway. Beyond Beni Mansour the scene changes once more; the fertile valley gives place to a region of barren kopjes, the orange and ochre hues of the mountains fade to gleaming gray, and stunted stone-pines scattered here and there amongst the jagged peaks alone relieve the gray monotony. Even in this desolate country Kabyle habitations are to be seen; and round about them a few goats and sheep, tended by the children from the hamlets, search diligently amongst the rocks for a few mouthfuls of tough vegetation. Near Mansoura the train passes through a long tunnel, and emerges upon a vast, high plateau. On the one side are the mountains of the coast, on the other the great range which separates the Tell from the Sahara Desert, and between them is as fertile a plain as one could wish to see. For miles and miles there is nothing but great stretches of corn-land, relieved here and there by open pastures where herds of well-liking cattle and flocks of goats and sheep graze at their pleasure. There are no fences to keep them away from the corn; it is cheaper to employ Arabs to herd them. Dotted over the plain are the settlements of Europeans, and native villages, and the low, dark tents of nomads who have wandered from the desert into this fertile region in search of pasture. From end to end of the great plateau there is a dearth of trees. Except for a few poplars in the neighbourhood of the villages, the country is treeless; even the hillsides are bare. One would like to see some attempt at afforestation on the part of the French Government. Surely the larch would take kindly to these broad uplands, or the Scots fir, which flourishes in and around Algiers.

The long stretch of fertile plain becomes monotonous as we journey towards Constantine—corn-land and pasture, and ever in the distance the bare mountain-ranges on either side. And so we climb steadily upwards to Setif, the ancient Sitifis of the Romans, and the capital of Mauritania. An earthquake and the Vandals and Arabs have left but little of its former glories; but it is still a town of some seven thousand inhabitants, situated three thousand four hundred feet above the sea-level. As we near Constantine the valley narrows once more, and there is a more settled and homely look about the farms and villages. The homesteads are well planted with trees, and storks have made their nests on roof and tree-top, and willows border the margins of the brook. The great stretches of the Tell, with its monotonous fertility, give place to pleasant, undulating scenery and a sense of snug prosperity. And so we come to Constantine, some two hundred and ninety miles from Algiers, the city of the great gorge, perched upon its aerie of rocks a thousand feet above the surrounding plain. A wondrous spectacle is the gorge which guards the town on two sides. From the bridge which covers the chasm with a single span of iron to the river Rummel beneath is a fall of four hundred feet. Below the new iron bridge are the remains of the old bridge and aqueduct which the Romans placed there in the fourth century. And below that again the river enters a huge vault in the rocks and disappears from view. The traveller can, if he pleases—and it is well worth his while—follow the river beneath this cavity. A path, cut in the solid rock, brings him to a narrow, winding stair which leads through the heart of the rock to a lower pathway. By two slanting bridges he crosses and recrosses the vaulted chasm, with the river rushing through a hundred feet below. Then he can follow the path again beneath the huge dome hung with stalactites, creeping along a platform riveted to the solid rock, until he sees above him a great circular gap in the roof through which a thin stream descends in a cascade to the river. Then, if he be wise, he will turn back; for the cascade appearing mysteriously from the gap in the roof and falling in spray to meet the river below finds its source in the drains of Constantine, which, with characteristic apathy in matters sanitary, the French have turned loose at this romantic spot.

Constantine is said to have withstood eighty sieges, but it was taken by the Romans in the fourth century; and after passing successively into the hands of the Arabs and the Turks, it was finally captured by the French in 1837, with heavy loss to the attackers, including General Damrémont, who was in command. It is a squalid town of about fifty thousand inhabitants, with little to recommend it beyond its superb situation and the gorge. There are, however, a few buildings worth visiting, and the old Arab quarter, which resembles that of Algiers in its air of mystery, in its narrow, precipitous streets, and in the glimpse which it affords of life in the unchanging East.

From Constantine let the traveller turn his face southward, for he has seen on his journey from Algiers only the gorgeous border of the great carpet which stretches from the Mediterranean to the Soudan—a border of every shade of green and orange, of dull-reds, and the purple-blues of

distance. The body of the carpet is of what is fashionably called 'camel-colour,' and in more prosaic phrase sandy, spotted here and there with islands of vivid green and shot with golden lights. The way across the border is by rail. A journey of one hundred miles will bring the traveller to the edge of the vast expanse of the Sahara, and he can be borne onwards another thirty into the great desert before the train sets him down at the terminus on the oasis of Biskra. The road lies across the Tell, through fertile, treeless lands to Batna, which is now an important military station; but it was founded long ago, in the fourteenth century, as a camp to guard the trade which passed from the Tell to the Sahara.

Close to Batna are the ruins of Timgad and Lambese, respectively the Thamugadi and Lamboesis of the Romans, relics of the highest civilisation that Northern Africa has ever known. But we who have set our faces to the desert are not concerned with ancient civilisations. We have our eyes fixed on the giant peaks and ridges of the Aurés Mountains, and our imagination on what lies beyond them. So we leave Batna and the ruins of dead empires behind, and seek a path through the barrier of the mountains. On this side there is only one gate into the desert, and the train, descending from the high plateau of the Tell, winds its way downwards through barren valleys and round obstructing spurs and bluffs in search of it. Fertility is left behind, and mountains of ochre and orange hues, spattered with the gray-green of thorn and scrub, close in upon the narrow track of steel. In the watercourses, which the melting snows of winter have channelled out in hillside and valley, oleanders and aspidistras give a deeper tone of green. And above, a cloud of locusts sweep like a glittering snowstorm between earth and sky. There is something dire and purposeful in the onward progress of the countless host which has come up out of the desert in search of what it may devour. It is making for the fertile lands of the Tell, where the wheat has brairded and the grass is young and succulent.

At last the train comes to a standstill at a tiny wayside station. It has found the gate, which stands open a few yards ahead—a narrow chasm in the barrier of the mountains, overhung by bartisans of orange rocks. The passage through the gate is only wide enough for the river and the road, and the rock itself has had to be tunnelled to make a passage for the railway track. It is called El Kantara—the bridge which leads to the desert. The train goes forward once more, and is swallowed up in the gorge, but only for a few moments. It clears the last tunnel, and rushes forth into the desert three hundred and fifty yards from the entrance to the gorge. The great plain of the Sahara stretches out before it, still held in the arms of the mountains. On the right hand is the oasis of El Kantara, a strip of vivid green nestling at the foot of the range through which we have gained admission. In front a great pile of red rocks rises abruptly from the plain, resembling a huge sphinx with its face turned towards the setting sun; and beyond, the last spurs of the Aurés Mountains, like the fingers of a great hand, retain a lingering grip on the fringe of the desert. The train climbs through deep cuttings over the last spur, and descends upon the oasis of Biskra, a little parcel of ground containing as incongruous a mixture of people and buildings as it is possible for one to imagine.

The extent of the oasis is about six square miles, and into this space are crowded the French settlement and barracks, the modern native town (built of mud and whitewash), about half-a-dozen hotels (including the imposing edifice of the Royal Hotel, with its high tower, which, for all its splendour, is built of mud and whitewash like the rest of the place), seven outlying villages, and two hundred and fifty thousand palm-trees. The trees are carefully counted as a basis of taxation by the French Government, every tree having to bear its share. Besides these signs of life and activity there are also the ruins of two ancient villages, now nothing but heaps of dried mud, with here and there the crumbling remnants of a wall. There are, too, a tram-line, and a casino, and a native market-place, and the tents of nomads, and the garden of Count Landon, rendered famous by Mr Hichens in his novel *The Garden of Allah*. It is impossible to speak of Biskra without making allusion to Mr Hichens's book, for, from the top of the tower of the Royal Hotel to the outermost wall of the Count's garden, he has described it with absolute fidelity, except that he has changed the names of places. Larbi playing his flute in the shady groves of the garden, and Smain keeping guard over the gate, can be seen by the traveller to Biskra any day of the week. They will even permit themselves to be photographed. The heroine, Domini herself, is to be seen there at certain times; and if Mr Hichens ever contemplates writing a sequel to *The Garden of Allah* it should prove interesting reading.

A dozen miles east of Biskra is the neighbouring oasis and town of Sidi Okba. Here there are no signs of French civilisation; the place is purely Arab, and on that account is worth visiting. There are neither trams nor a casino in Sidi Okba; but the traveller can drive there from Biskra, provided the river (which has to be forded) is not in flood. A rough road follows the line of telegraph-poles from oasis to oasis across the desert. For the first few miles it passes through land which has been brought under cultivation by means of irrigation. It is wonderful what water can do for the most unpromising-looking soil. That the Sahara was once the bed of an ocean there can be no doubt—there are still great salt lakes to be found in it; for the rest, it consists of sand in varying degrees of friability, sometimes hard and flat (as though it had been pounded down), with rough scrub growing

in tufts upon it, sometimes in waves of finest powder, sometimes in dunes and hillocks, but always sand. Yet, when the water has been brought to it and seed has been sown, it will yield fine crops of wheat and barley or groves of date-palms and fig-trees. The French have done much to extend irrigation in the Sahara, and great tracts of corn now grow where once there was nothing but sand. The great plain between El Kantara and Biskra is cultivated to a large extent, and for some miles round Biskra.

But to return to the road to Sidi Okba. We are soon clear of the cultivated ground, and following the track across the boundless waste of sand. To the north are the golden peaks of the Aurés Mountains, with here and there an oasis of green palms nestling at the foot. In front the low, dark line which marks the oasis of Sidi Okba; and to the south an unbroken expanse of sand. Caravans of camels move leisurely along parallel to the road, laden with merchandise or carrying on their humps the women and children of the merchant's household in nests of coloured cloths or stately palanquins. A party of Arab horsemen in flowing draperies, sitting their horses with a grace born of balance rather than grip, swings past at an easy gallop. Humbler folk follow more sedately on mules or donkeys, whilst others trudge on foot down the middle of the road with long, easy strides. There is plenty of life to be seen on the desert road to Sidi Okba, and the town itself is teeming with life. The narrow streets between the mud walls are thronged with a many-hued crowd, some sitting at the doors of their houses, others passing leisurely along on business or pleasure bent. The market-place is a scene of confused delight, with its groups of buyers and sellers, and tents, and groaning camels, and panniered donkeys, and skulking dogs, and the sound of many voices, and the dazzling brightness of the desert sunlight. There is neither order nor reason in the hap-hazard arrangement of wares and caravans, every man having taken his pitch where it seemed good to him. Here is a merchant with skins of dates for sale to the nomads or such as are taking a journey to Tougourt or some distant oasis. Next to him is the tent of a blacksmith, with its forge and bellows and anvil. A drove of small donkeys stands patiently by, their panniers laden with salt, and amongst them three children in *gonduras* of purple, yellow, and blue are playing a game of hop-scotch.

Sidi Okba is the religious capital of the Ziban, a place of pilgrimage famous for its mosque, which is reputed to be the oldest Mohammedan building in Africa. The mosque has a high, square tower and a low dome, and within the precincts is a magnificent door of embossed bronze, said to be a relic of the Roman period. It is the shrine of Sidi Okba, the Arab conqueror of North Africa, and dates from the eighth century.

We take our leave of Sidi Okba, with the feeling that, at last, we have found a spot untouched by the influences of European occupation. And even as the congratulations are still on our lips, and we pass from the mosque down a crowded street, we see at an open stall a tailor running up the seams of a *burnous* with a Singer's sewing-machine.

A THREE-CORNERED DUEL.

By F. G. Aflalo.

WHIZ! Up in the sunlight of a Florida May morning goes a hundredweight of tarpon, the curved symmetry of it throwing dazzling sheen in the eyes of the angler, as he quickly slips the butt of his rod in the socket screwed to the thwart of his boat and lets the reel spin, despite all its brakes and checks, so fast that the diminishing line on the barrel is but a blur.

It has been a blistering morning in the Pass called Boca Grande. Not a breath of air stirs the unruffled waters of the Gulf of Mexico, and two schooners trading to the Pass for phosphates lie helpless a mile away. Great pelicans flap lazily over the shallows, filling their pouches with baby garfish. A man-of-war hawk floats high in the cloudless blue. A chattering and obscene band of the little vultures known familiarly throughout the United States as turkey-buzzards raven over the remains of a shark, part of yesterday's spoil, festering on the beach. Six little skiffs are drifting up the Pass, each occupied by a 'guide' or boatman, white or coloured (or one of those many hues that intervene), and by an angler, who, turning his back on his attendant, holds on to his rod in grim expectation of a pull from one of the scaly giants of the coral underworld.

One of the anglers, sure enough, has hooked a fish, and for the third time in five minutes the whole six feet of burnished silver is in the air, a good hundred yards away from the boat, but so close to another that its fall drenches the occupants with spray.

'Make him jump!' is the exhortation from a neighbouring skiff, but it is the last appearance of the gymnast, which now settles down to other tactics scarcely less dangerous to a successful issue than those paralysing leaps; for any one who has handled the smaller game of the salmon-river or trout-stream at home instinctively raises or lowers the rod at the right moment when the fish is in the air, and the worst risk of such evolutions is that of the hook coming away from its imperfect hold of

that adamantine palate as the mighty fish bends its lissome body like a tense bow, slacking for an instant the bellying line. Indeed, unless the hook is well home in one of the few comparatively soft spots, it is likely to come out with a spring, and the fish falls back tail-first, to enjoy another lease of life, a case of 'Merry met and merry part!'

This particular tarpon, having made three jumps in vain, resolves on other means of ridding itself of that maddening hook. But for the links of chain, the stout wire snell must have kinked and snapped under so tremendous a strain; but American ingenuity has well-nigh perfected the tackle for the big game of the sea, and, in addition to making it a little stronger than the sportsman may care about, has invested it with practical immunity from disaster. Lost tarpon—which average probably three in every five—may not always be the fault of the fisherman, but need never be the fault of his tackle. 'Gentleness,' says La Fontaine, 'does more than violence;' and with modern tarpon-tackle you can use either as preferred.

Away goes the tarpon, heading for the open sea. The guide, skilled in promptly realising and as promptly defeating its every trick, backs water with all his might, and the angler gets in line as best he can, availing himself of the leverage on the socket and alternately raising and lowering the top of the rod with a pumping movement alone equal to the occasion.

Of a sudden the line comes in with suspicious smoothness. The first fear of the novice is that the tarpon has broken loose. The guide knows better, and bids him reel in like—anything picturesque that occurs to him. The fish is merely doubling on its tracks and heading for the boat. This is a favourite trick of many fish when hooked, and is often seemingly dictated by the wonderful instinct that it will puzzle the enemy and enable them to shake out the hook on a slack line. Or it may be, of course, that by lessening the tension they diminish the pain in their jaws.

On this occasion, however, there is another reason. A sudden boil and swirl, not fifty yards away, and a momentary vision of an ominous black fin which belongs to something bigger than a tarpon, and the guide, now rowing like mad for the not distant beach, announces that a shark, which he describes in terms not free from bias, is in pursuit. He adjures his patron not to 'yank' the tarpon in. He must, of course, keep a strain on the line, but he must on no account drag the fish through the water. To do so is only to play the shark's game, and the loss of the tarpon will be a 'cinch.' If pulled in one direction, the guide says, the tarpon makes little attempt to get away from its grisly pursuer, but obeys its stronger instinct of resisting the pull on the line, and thus falls an easy prey to the cruel jaws behind. Therefore it must, in moderation, be given rope, and it will then twist and turn and lead the unwieldy shark a fearful dance, the while it is being gently coaxed towards the sandy shallows outside the coral forest. Here, surely, is a singular position, in which, for the moment, the angler and his fish are allies against the common enemy of both, a triangular duel, as it were, common enough in tropical seas, but rarely engaged in at home. In the 'white water' of the shallows Master Shark, as a rule, gives up the chase, distrusting the shoal-water, particularly as the guide leaps over the side the moment the keel grates on the soft sand, and wades out with the long gaff-pole brandished for the final stroke.

This particular shark, however, is more determined, and, although those in the boat can but dimly see its sinuous form cleaving the water very near the terrified tarpon, the keeper of the lighthouse, from his vantage on a sandhill, calls out that it is a 'dandy' tiger-shark fully fifteen feet from snout to tail.

The boat is aground, the guide is in the water, and now at length, baffled of its meal, the shark draws off, doubtless ready for a rush if the tarpon should also be scared by the barelegged apparition and seek safety in flight. But the great herring, caught between the deep sea and worse, is either aware of the alternative risk or has lost its head, for it swims half-heartedly backwards and forwards in the shallows until, after one misdeal, the great gaff is buried in its flank and it is drawn up on to the beach, a tarpon in the pink of condition, well over six feet long. The excitement lasted until the fish was safe on the beach. Then it was over. For the fowler, the bird in the hand may be better than a flock in the bush; but the fisherman, like the heir-at-law, prefers a good fish in prospect to a small one in the basket, or, as the Spanish has it, *Mas vale buena esperanza que ruin posesion* ('Great expectations are better than poor possessions').

The great fish is uneatable. Even the nigger's palate rejects it, so it must be fearsome food. Wherefore it would be very gratifying to turn the fish adrift, after measuring it from tip to tip. Even with that pin-prick in its side (which can be avoided by playing the game to a finish and hauling the exhausted fish ashore by the wire trace), it could hold its own against sharks or any other dangers of its own world. Yet local custom prescribes that it shall be weighed the same evening and duly entered in the log at Useppa, and that one of its beautiful scales, larger than a crown-piece, shall be nailed up in the hall of the inn. The pity of it! One of these days, let us hope, the less wasteful and more sportsman-like fashion of Texas and Mexico will be adopted in Florida, and every tarpon, with the exception of an occasional trophy of more than average weight and length for the smoking-room at home, will be measured and returned to the water to give better sport another season, when, for all we know of tarpon growth, it may have added fifty pounds to its weight. Such a course is almost as good as eating your cake and having it too—all the joy of capture, none of the reproach of killing!

GLIMPSES OF MEXICO.

By Frank H. Shaw.

THERE are several ways of getting to Mexico. You may take train at New Orleans, if you will, and steam placidly along the coast of the Gulf, passing through the rich lands of Texas, and crossing into the old-world country by land; or you may travel instead by steamer, and arrive either at Rio Grande or Vera Cruz. But, whichever method you choose to adopt, you will find yourself the subject of a lightning change, for you will leave the twentieth century behind you at once, and plunge into past ages. Mexico sleeps, some say like a volcano with a fiery heart that will erelong burst into ghastly eruption; but still she sleeps, and the brooding calm of ancient days is upon her cities and upon the entire land. True, there may be an air of fictitious movement in the coast-ports. Fussy tugs will bring sallow Customs officers to examine into your possessions; yelling hack-drivers will welcome you as soon as your foot touches the shore; but you have the feeling upon you that this is merely surface turmoil put on for the occasion, and that the city will fall asleep as soon as your arrival has become a few hours old.

But even at Vera Cruz you see some traces of that volcanic heart, for the demon of yellow-fever which once held ominous sway here has been exorcised; where once the pestilential swamps lay exhaling all manner of foul odours now stands the embryo of a growing seaport. Foreign enterprise accounts for it; were the native Mexicans to be allowed their own way they would let ships land as did Cortez—by running them ashore on the sand and trusting to Providence that they might take no scathe. For Mexico is the land of *mañana* (to-morrow), where no self-respecting man does that to-day which can be thrust ahead into next week or next week but one.

And yet, in spite of its dreaminess, in spite of its lack of enterprise, this strange land weaves a wondrous fascination about your heart. The divine peace of Lethe is here about you—it enters into your being; for a while you feel tempted to throw off your native zeal for swift action, and merge yourself into the *dolce far niente* which here reigns supreme. There are so many inducements to laziness. The old white houses bask dreamily in the blazing sunshine; they are relics of a bygone age, but they seem eminently in place here in Mexico. The gaily dressed country-people, in town on holiday, loiter aimlessly about the baking streets; and they, blazing as they are with all the colours of the rainbow, caparisoned with silver buttons and gaudy kerchiefs, might have stepped out of the pages of a medieval romance. The modern port, with its steamers from overseas, with its weary-looking battleship, with its puffing, snorting dock-engines, is an anomaly, an eyesore upon the serene peace of Mexico. Leave it behind, and fare you forth into the interior, for here you will see civilisation at a standstill, the Middle Ages brought to life.

There are railways in Mexico; but they partake of the nature of the place, and grow lazy. So you saunter along through the country at no hasty pace; instead, you have vast opportunities for those long, long thoughts given birth by a country that is as rich in historical interest as any portion of the vast American continent. Here Cortez raged terribly; possibly his mailed adventurers climbed this very sandhill up which you are wending now. Here again, on this slight eminence, the bewildered Mexicans stood in awe, watching the arrival of those fierce armoured men against whom their most deadly weapons shattered like glass. Farther on, in that hollow, unaltered for nearly four centuries, the fearless conqueror attacked the rival bands of Spanish adventurers, and won a bloody victory, hastening back hot-foot to reconquer the chief city of Montezuma, which had revolted in his necessary absence.

Every inch of the way you take teems with interest, but the peace of ages slumbers over all to-day. The tobacco-plant flourishes where once the blood of Mexican patriots dyed the soil rich

[*All Rights Reserved.*]

crimson. The nearest approach to the mailed men of Spain are the loosely riding *vaqueros*, with ready lasso at the saddlebow, with huge saddles and huger spurs, their broad-brimmed hats shading swarthy, fierce faces, their drooping lips cherishing the ever-present cigarette of powdery tobacco and maize-leaf.

Away there to the left the snow-clad peak of Orizaba towers into the peaceful blue some eighteen thousand feet, and once upon a time the glint of the setting sun on that white splendour was the signal for a nation to fall to prayers. Farther ahead, serene, immovable, the same as when Columbus fared forth to discover a new world in the west, Popocatepetl, hoary giant that he is, looms large and commanding, overshadowing the ancient city of Mexico as it has done since history began.

So you come to Mexico City, a place wherein to dream away a halcyon life. The city reposes in an exquisite valley, elevated sufficiently to enjoy a cool, exhilarating climate, which is never too cold. Here you are in the centre of Mexican history straightway. Where now stands the Plaza Mayor once stretched the great open space of the Aztec meeting-square, where Montezuma treated with Cortez, and where he was seized and held as hostage for the misdoings of his patriotic countrymen. Here stood the altars of the sun, tended by many virgins of wondrous beauty. And all about the ancient city the waters of a vast lake creamed and fretted, rendering it—so thought the Mexicans—impregnable at all points; but the valiant Cortez sneered at such trivial obstacles, and, having conquered, set to work to erect a city which should surpass in beauty even the marvellous town that he had seized. Tenoctitlan died, Mexico City had birth, and the waters of the lake retired and left the place, as it is to-day, a scene of surpassing beauty.

Here, almost on the very spot where the temple of the sun upreared its cunningly carved columns, stands a vast cathedral, a monument of architecture, a landmark throughout the city. Its two great towers are weather-worn and faded; but they have about them a quaint, quiet beauty far excelling the modern products that lie about. Yet are these more modern specimens of the builder's art not to be despised, for the municipal and national palaces are possessed of much fantastic charm. There is the University, once a stronghold of Jesuitism, established in the sixteenth century; but now that school of culture is closed, after a life of three centuries. Here is the Academy of Fine Arts and a bewildering maze of churches, all of which are beautiful, most of which betray their age in crumbling pilaster and bulging wall.

That hill there to the south-west is Chapultepec, where Montezuma dwelt in state, surrounded by a Court that for magnificence and wealth has never been excelled. His gold-covered nobles flaunted about him; his rich, contented people sang daily praises to his name; but that is of the past, and now, where once the ordered throngs of courtiers trooped, the soldiers of a Spanish-American republic form and break, the clang of the grounded rifle rings in place of the stone-headed axe and the sword of glass. For where stood Montezuma's palace now rests the military school; while still more to the south of the city is a noble astronomical observatory, surrounded by *haciendas*, country-houses of the wealthier proprietors of the land. North and west lies Guadelope—which holds the same relation to Mexico as Lourdes does to France—a place of marvellous healing, to which flock cripples and invalids innumerable, faithful to believe that the virtue of the waters will cleanse them of their pains.

The city swarms with life; yet it is still-life. It is the hour of the siesta when you arrive, and the streets are deserted of moving things, though every darkened doorway possesses its own colony of slumberers who have cast themselves down where they stood, to sleep away the heat-laden hours when no man works. Even the very dogs slink into the shadow of the dazzling walls and loll pitifully. The tinkle of mule-bells is hushed; the cry of the muleteer sounds no longer. To walk through these streets with imperious foot, after the British fashion, seems sacrilege; one might be walking through a city of the dead.

But the hot hours pass, the city awakens, the mules strain and plunge at the collar, the dogs prowl about between the legs of those who pass, the shops are opened, the scent of garlic-saturated cookery rises strongly, mantilla-shrouded faces peep from ancient casemates protected by massive iron bars, and the city of sleep becomes a city of leisurely wakefulness. You notice these barred casemates particularly; they are a feature of Mexico. Householders bar the windows and leave the door unfastened; and here you have an epitome of Mexican character: Do nothing openly, everything on the sly, even to wooing your lady-love.

You might spend a long lifetime in Mexico City and still leave much unseen, there are so many features to note: the actual city life, the life lived behind those jealously guarded windows, the life lived in the flower-scented *patios* where cooling fountains play with musical softness. Here comes a *vaquero* riding nonchalantly up the street, a typical product of Mexico, a cattle-hand from one of the outlying ranches, a perfect fury unchained when the liquor of the country is in him, a gentle, dreamy child when the liquor has evaporated, and yet between the two events he might have committed a dozen murders without the slightest compunction. His swarthy face is alight with merry laughter; his ear-rings sparkle in the declining sun; the gay trappings of his magnificent horse fling back dazzling specks of colour. In his *chaparajos* (those fringed overalls which protect the speckless,

white riding-breeches from the dust of the way), his bell-buttoned jacket, his *sombrero*, with the haft of a *machete* protruding from his crimson sash, he might be a hero of old legend instead of a commonplace cowboy.

See him now, listless, with an eye for a pretty face, a swift curl of a sweeping moustache for every glance bestowed upon him. A lazy man, you say; but—a hoarse bellow breaks out down the wide street, people fly hither and thither, and a maddened bull breaks loose. He is charging head-down along the way, his fiery nostrils breathing death. Our *vaquero* spurs his horse around, and negligently casts loose the lasso at his saddlebow. On comes the bull; into the wall backs the horse. The bull is past; he is free—escaped to pursue his depredatory course unchecked. Ah! the loop of the rope whistles out softly; it poises for a moment over the lowered horns, it alights, and the horse is straining back on its haunches as the lasso thrills like a harp-string. Where is the *vaquero's* laziness now? Gone—he is a statue of vigorous action, his muscles tense to the strain. The horse moves swiftly in obedience to the spur; the noosed head rolls fearfully; but here is cunning skill, and almost before the hoarse bellow of anger is checked the bull is down—a captive. Then those who should have kept custody over the animal run in and secure him, while the *vaquero* disentangles his lasso, gives a glance up to the nearest windows to see if fair eyes have marked his prowess, coils his rope on the cantle, twirls his moustache, and slowly ambles away, lazily indifferent to the huzzas that follow him.

If you want to see Mexico proper, as dissociated from Mexico City, you should leave the beaten track and take to mule-transit, which is leisurely, picturesque, and offers great facilities. For the greater part of Mexico is strange to the iron horse; and so, following roads that the Aztecs might have made, you disembogue on wide and rolling plains which climb slowly up to the foothills of the vast sierras, and droop down to the inconsiderable rivers, which, useless for water-borne traffic, are excellent for fertilisation. Vast herds of cattle roam these plains practically unchecked, save at the half-yearly round-up, when the lazy *vaqueros* become fiends unchained, and single out the most savage bulls with a cool yet passionate ardour that is peculiarly Mexican. Far away lies a white *hacienda*, a country gentleman's estate, ancient, savouring of chivalry and romance. Yet behind those straggling walls you will find treasures of bijouterie and vertu that at one time graced palaces in old Seville; and, while the inanimate objects are of considerable intrinsic worth, you will find something else that is almost priceless—the polished manners of a bygone age.

Some of these outlying *haciendas* are held by lineal descendants of those old-time Conquistadores, who, whatever their faults, were gentlemen confessed, and that strain has percolated down through the centuries almost unaltered, so that when you ride up at sunset to such a *hacienda* you will be received with a grave courtliness that will make you wonder. Following the ancient law of hospitality, the owner of the estate will put his best at your disposal, and you will be made an honoured guest. They will fetch for you oranges fresh-plucked, delicious, juicy, impossible to describe; they will treat you as a superior, not only as an equal, and you will find that a Mexican welcome is a treasure to dream on for all the remainder of your life.

Your road takes you from the plains now, and leads you into mighty mahogany-forests, where the monarchs of the woods rear their stately heads serenely to the unflecked sky. Cortez might have taken the parents of these monarchs to make him a palace; but now they are being felled to right and left to find a lowly home in Tottenham Court Road and the thousand dwellings of our English middle-class. Logwood is here too in great abundance, while coffee-bushes occupy many a fertile square mile of space. But here is something new and strange—tobacco in the leaf. Mexico is now producing tobacco that bids fair to rank with the weed of Havana; and when once the lack of enterprise common to the land has been overcome by foreign go-aheadness, the product of Mexico may flood the markets of Europe.

If you wish to spend an informative day, you might well do worse than alight at one of these tobacco plantations and watch the process of preparing the leaf. You might learn much of value as to plucking, sorting, sweating, pressing, curing, and the like, following all the many intricacies that pursue the leaf from the soil to the completed cigar. But you have not time, for there are silver-mines to be seen and wondered at—Mexico is the second largest silver-producing country in the world; but your wonder is not at the wealth so much as at the indifference with which the mines are worked. There is no progress; the modern machinery that would drag out ten times as much wealth in a week as the actual labour does in a month is conspicuous by its absence; but there will come a time when Mexico will awaken, and then all this gospel of *mañana* will be changed.

You leave the natural products of this wonderful land to gaze upon the artificial gems with which it abounds; for here are traces of a civilisation that was old when Egypt was young. Nay, more than that, there are some who will tell you that the lost continent of Atlantis was in close touch with the vast civilisation that existed in Mexico before ever the Pharaohs arose. When Moses lived, so say some, Mexico was at the height of its prosperity, and there are traces which show this is not all a savant's dream. Go to the ruins of Mitla in Oajaca, to the ruins of Xochicalco in Morelos, and you will see that the hands that moved these vast relics into their original positions were possessed of equal cunning with those which built

the Pyramids. But one and all speak of yesterday. That is the prevailing note of Mexico—yesterday, whether in its buildings, its industries, or its people. Yesterday and to-morrow—that is the Mexican character, and bitterly do Mexicans resent any encroachments upon their ancient customs. They have no use for the present; the future may take care of itself.

THE HOUSE OF WHISPERS.

CHAPTER XXI.—THROUGH THE MISTS.

SIR HENRY refused to speak with his daughter when, on the following morning, she stole in and laid her hand softly upon his arm. He ordered her, in a tone quite unusual, to leave the library. Through the morning hours she had lain awake trying to make a resolve. But, alas! she dared not tell the truth; she was in deadly fear of Flockart's reprisals.

That morning, at nine o'clock, Lady Heyburn and Flockart had held hurried consultation in secret, at which he had explained to her what had occurred.

'Excellent!' she had remarked briefly. 'But we must now have a care, my dear friend. Mind the girl does not throw all prudence to the winds and turn upon us.'

'Bah!' he laughed, 'I don't fear that for a single second.' And he left the room again, to salute her in the breakfast-room a quarter of an hour later as though they had not met before that day.

Gabrielle, on leaving her father, went out for a long walk alone, away over the heather-clad hills. For hours she went on—Jock, her Aberdeen terrier, toddling at her side, in her hand a stout ash-stick—regardless of the muddy roads or the wet heather. It was gray, damp, and dismal, one of those autumn days which in the Highlands are often so very cheerless and dispiriting. Yet on, and still on, she went, her mind full of the events of the previous night; full, also, of the dread secret which prevented her from exposing her father's false friend. In order to save her father, should she sacrifice herself—sacrifice her own life? That was the one problem before her.

She saw nothing; she heeded nothing. Hunger or fatigue troubled her not. Indeed, she took no notice of where her footsteps led her. Beyond Crieff she wandered, along the river-bank a short distance, ascending a hill, where a wild and wonderful view spread before her. There she sat down upon a big boulder to rest.

Her hair blown by the chill autumn wind, she sat staring straight before her, thinking—ever thinking. She had not seen Lady Heyburn that day. She had seen no one.

At six o'clock that morning she had written a long letter to Walter Murie. She had not mentioned the midnight incident, but she had, with many expressions of regret, pointed out the futility of any further affection between them. She had not attempted to excuse herself. She merely told him that she considered herself unworthy of his love, and because of that, and that alone, she had decided to break off their engagement.

A dozen times she had reread the letter after she had completed it. Surely it was the letter of a heart-broken and desperate woman. Would he take it in the spirit in which it was meant? she wondered. She loved him—ah, loved him better than any one else in all the world! But she now saw that it was useless to masquerade any longer. The blow had fallen, and it had crushed her. She was powerless to resist, powerless to deny the false charge against her, powerless to tell the truth.

That letter, which she knew must come as a cruel blow to Walter, she had given to the postman with her own hands, and it was now on its way south. As she sat on the summit of that heather-clad hill she was wondering what effect her written words would have upon him. He had loved her so devotedly ever since they had been children together! Well she knew how strong was his passion for her, how his life was at her disposal. She knew that on reading those despairing lines of hers he would be staggered. She recalled the dear face of her soul-mate, his hot kisses, his soft terms of endearment, and alone there, with none to witness her bitter grief, she burst into a flood of tears.

The sad grayness of the landscape was in keeping with her own great sorrow. She had lost all that was dear to her; and, young as she was, with hardly any experience of the world and its ways, she was already the victim of grim circumstance, broken by the grief of a self-renounced love gnawing at her true heart.

The knowledge that Lady Heyburn and Flockart would exult over her downfall and exile to that tiny house in a sleepy little Northamptonshire village did not trouble her. Her enemies had triumphed. She had played the game and lost, just as she might have lost at billiards or at bridge, for she was a thorough sportswoman. She only grieved because she saw the grave peril of her dear father, and because she now foresaw the utter hopelessness of her own happiness.

It was better, she reflected, far better, that she should go into the dull and dreary exile of an English village, with the unexciting companionship of Aunt Emily, an ascetic spinster of the mid-Victorian era, and make pretence of pique with Walter, than to reveal to him the shameful truth. He would at least in those circumstances retain of her a recollection fond and tender. He would not

despise nor hate her, as he most certainly would do if he knew the real astounding facts.

How long she remained there, high up, with the chill winds of autumn tossing her silky, light-brown hair, she knew not. Rainclouds were gathering, and the rugged hill before her was now hidden behind a bank of mist. Time had crept on without her heeding it, for what did time now matter to her? What, indeed, did anything matter? Her young life, though she was still in her teens, had ended; or, at least, as far as she was concerned it had. Was she not calmly and coolly contemplating telling the truth and putting an end to her existence after saving her father's honour?

Her sad, tearful eyes gazed slowly about her as she suddenly awakened to the fact that she was far—very far—from home. She had been dazed, unconscious of everything, because of the heavy burden of grief within her heart. But now she looked forth upon the small, gray loch, with its dark fringe of trees, the gray and purple hills beyond, the gray sky, and the gray, filmy mists that hung everywhere. The world was, indeed, sad and gloomy, and even Jock sat looking up at his young mistress as though regarding her grief in wonder.

Now and then distant shots came from across the hills. They were shooting over the Drummond estate, she knew, for she had had an invitation to join their luncheon-party that day. Lady Heyburn and Flockart had no doubt gone.

That, she told herself, was her last day in the Highlands, that picturesque, breezy country she loved so well. It was her last day amid those familiar places where she and Walter had so often wandered together, and where he had told her of his passionate devotion. Well, perhaps it was best, after all. Down south she would not be reminded of him every moment and at every turn. No, she sighed within herself as she rose to descend the hill, she must steel herself against her own sad reflections. She must learn how to forget.

'What will he say?' she murmured aloud as she went down, with Jock frisking and barking before her. 'What will he think of me when he gets my letter? He will believe me fickle; he will believe that I have another lover. That is certain. Well, I must allow him to believe it. We have parted, and we must now, alas! remain apart for ever. Probably he will seek from my father the truth concerning my disappearance from Glencardine. Dad will tell him, no doubt. And then—then, what will he believe? He—he will know that I am unworthy to be his wife. Yet—yet is it not cruel that I dare not speak the truth and clear myself of this foul charge of betraying my own dear father? Was ever a girl placed in such a position as myself? I wonder. Has any girl ever loved a man better than I love Walter?' Her white lips were set hard, and her fine eyes became again bedimmed by tears.

It commenced to rain, that fine drizzle so often experienced north of the Tweed. But she heeded not. She was used to it. To get wet through was, to her, quite a frequent occurrence when out fishing. Though there was no path, she knew her way; and, walking through the wet heather, she came after half-an-hour out upon a muddy byroad which led her into the town of Crieff, whence her return was easy; though it was already dusk, and the dressing-bell had gone, before she re-entered the house by the servants' door and slipped unobserved up to her own room.

Elise found her seated in her blue gown before the welcome log-fire, her chin upon her breast. Her excuse was that she felt unwell; therefore one of the maids brought her some dinner on a tray.

Upon the mantelshelf were many photographs, some of them snap-shots of her schoolfellows and souvenirs of holidays, the odds and ends of portraits and scenes which every girl unconsciously collects.

Among them, in a plain silver frame, was the picture of Walter Murie taken in New York only a few weeks before. Upon the frame was engraved, 'Gabrielle, from Walter.' She took it in her hand, and stood for a long time motionless. Never again, alas! would she look upon that face so dear to her. Her young heart was already broken, because she was held fettered and powerless.

At last she put down the portrait, and, sinking into her chair, sat crying bitterly. Now that she was outcast by her father, to whom she had been always such a close, devoted friend, her life was an absolute blank. At one blow she had lost both lover and father. Already Elise had told her that she had received instructions to pack her trunks. The thin-nosed Frenchwoman was apparently much puzzled at the order which Lady Heyburn had given her, and had asked the girl whom she intended to visit. The maid had asked what dresses she would require; but Gabrielle replied that she might pack what she liked for a long visit. The girl could hear Elise moving about, shaking out skirts, in the adjoining room, and making preparations for her departure on the morrow.

Despondent, hopeless, grief-stricken, she sat before the fire for a long time. She had locked the door and switched off the light, for it irritated her. She loved the uncertain light of dancing flames, and sat huddled there in her big chair for the last time.

She was reflecting upon her own brief life. Scarcely out of the schoolroom, she had lived most of her days up in that dear old place where every inch of the big estate was so familiar to her. She remembered all those happy days at school, first in England, and then in France, with the kind-faced Sisters in their spotless head-dresses, and the quiet, happy life of the convent. The calm, grave face of Sister Marguerite looked down upon her from the mantelshelf as if sympathising with her pretty pupil in those troubles that had so early come to her. She raised her eyes, and saw the portrait. Its sight aroused within her a new thought and fresh recollection. Had not Sister Marguerite always taught her to beseech the Almighty aid

when in doubt or when in trouble? Those grave, solemn words of the Mother Superior rang in her ears, and she fell upon her knees beside her narrow bed in the alcove, and with murmuring lips prayed for divine support and assistance. She raised her sweet, troubled face to heaven and made confession to her Maker.

Then, after a long silence, she struggled again to her feet, more cool and more collected. She took up Walter's portrait, and, kissing it, put it away carefully in a drawer. Some of her little treasures she gathered together and placed with it, preparatory to departure, for she would on the morrow leave Glencardine perhaps for ever.

The stable-clock had struck ten. To where she stood came the strident sounds of the mechanical piano-player, for some of the gay party were waltzing in the hall. Their merry shouts and laughter were discordant to her ears. What cared any of those friends of her step-mother if she were in disgrace and outcast?

Drawing aside the curtain, she saw that the night was bright and starlit. She preferred the air out in the park to the sounds of gaiety within that house which was no longer to be her home. Therefore she slipped on a skirt and blouse, and, throwing her golf-cape across her shoulders and a shawl over her head, she crept past the room wherein Elise was packing her belongings, and down the back-stairs to the lawn.

The sound of the laughter of the men and women of the shooting-party aroused a poignant bitterness within her. As she passed across the drive she saw a light in the library, where, no doubt, her father was sitting in his loneliness, feeling and examining his collection of seal-impressions.

She turned, and, walking straight on, struck the gravelled path which took her to the castle ruins.

Not until the black, ponderous walls rose before her did she awaken to a consciousness of her whereabouts. Then, entering the ruined courtyard, she halted and listened. All was dark. Above, the stars twinkled brightly, and in the ivy the night-birds stirred the leaves. Holding her breath, she strained her ears. Yes, she was not deceived! There were sounds distinct and undeniable. She was fascinated, listening again to those shadow-voices that were always precursory of death—the fatal Whispers.

(To be continued.)

THE CUSTOMS TARIFF IN ACTION.

THE story of how the vast Customs revenue, amounting in the last financial year to over thirty-four million pounds, is safely gathered in and handed over to the Exchequer is neither uninteresting nor uninstructive. The tale properly starts with the arrival of the large steamship whose cargo is now being discharged into the shed in which we stand. Having despatched preliminary quarantine business, the Customs officer proceeds to check the 'stores.' These are the tobacco, spirits, wines, and other dutiable goods in the charge of the steward or in the possession of the crew. A list of the quantities held by each, signed by all concerned, has been furnished to him on his boarding the vessel. He now goes round examining these, leaving sufficient for the immediate use of those victualling on board, the overplus being collected and put in a store-room or locker under seal.

By the time the boarding officers have carried out these duties the vessel has nosed her way to the dock entrance, where, with warps ashore, she awaits admission. Her passengers are making ready to land, and as soon as the ship is berthed their baggage will be rushed ashore into the shed, where a number of officers have gathered for its examination. As the passengers come forward to claim their belongings the stereotyped inquiry is addressed to each, 'Have you anything in your possession liable to duty, such as tobacco, cigars, spirits, saccharin, or perfumery?' Then comes that awkward moment for the passenger who has worked himself into a feeling of resentment against a grasping Government which seeks to levy toll upon the few cigars he has bought abroad. He glances at the stolid questioner who has intuitively divined the cause of the momentary hesitation. He was to have protested against the iniquitous demand; but instead he rather flusteringly murmurs something about there being a few cigars somewhere, and then opens his trunk. Almost on top is the nearly empty cigar-box put there on purpose. 'Have you any more?' is asked; and then, from this corner and from under that article of clothing, out of this or that pocket, goaded on by the same insistent question, there are dragged out these wretched weeds, until, with a curt 'That's all,' the discomfiture is complete. The officer skilfully runs his hand down through the contents of the trunk, gropingly feels his way from top to bottom and from side to side, and now, being satisfied that nothing dutiable has escaped notice, marches off with the booty to one of his colleagues who is engaged near by weighing the cigarettes, cigars, and tobacco produced by other passengers. The weight is taken, duty collected, a receipt is given, and the passenger is free to remove his belongings. One more scrutiny is made at the exit to see that the package bears the hieroglyph which tells that every man has paid his duty.

That, in short, is the process of baggage examination. Passengers who bring only a small quantity of dutiable goods—limited to half a pound of cigars

or tobacco, a half-pint bottle of brandy, and the same quantity of perfumery—are allowed these duty-free; but if anything over these quantities is produced, the whole, without deduction, is charged with duty. When anything undeclared is discovered—as, for instance, a few pounds of tobacco under a false bottom to a trunk or artistically stowed away in a spare pair of boots, or a box of cigars wrapped up in some article of clothing or nicely sandwiched in amongst books—there is serious trouble. Written down smuggler, the passenger may be offered the option of depositing a sum exceeding three times the amount of duty chargeable or of appearing before a magistrate. Part of the deposit may be returned if the chief authorities regard the case as venial; but even the satisfaction of that remission is partial, for the goods seized are always confiscated, the cigars and spirits to be sold, the tobacco to be consumed by criminal lunatics or used for fumigating the national conservatories at Kew or Edinburgh! Not often is the passenger searched; but occasionally this is necessary, and seldom is the covert drawn blank. When the sugar-tax was reimposed in 1901, a duty of twenty shillings per pound was laid upon saccharin. This heavy duty led to an outbreak of smuggling, carried on in many cases by hirelings who regularly journeyed to and from the Continent, where saccharin could be obtained at low prices, bringing on their persons such quantities as would be likely to pass unobserved. He was one gifted with originality who devised the plan of concealing his burden in an artificial hump. Women were, however, the most difficult culprits to detect. One there was who betrayed herself as she moved about by a tiny trickle of the powder coming from one of the concealed bags with which she was laden.

All the passengers have now departed, and the officers, the work of baggage examination being finished, have now to rummage the vessel. Directed by their superior, the rummagers, clad in dungarees and supplied with lamps, wires, and various cunning devices for detecting contraband, attack some section of the vessel. Perhaps the galley has been selected for the first effort. Tins of freshly run dripping are suspect and must be pierced with a long needle; the covered saucepans on the stove or shelves must be looked into, the coals in the bunker turned over. Lamps are shone into the various corners—it is wonderful how many there are in this caboose—cupboards are examined, but all to no purpose; so, with a cheery 'Good-day to you, cooky,' they are off to pay a visit to the fo'c'sle. Here again every possible hiding-place is examined and tapped for hollow spaces, and a consultation held as to why one part has been freshly painted, or whether certain marks made on a particular place when the ship was last rummaged have been disturbed. Then the ship's lifeboats are made for, their covers partially unlaced, and in through the aperture one of the rummagers creeps. He taps all the copper tanks with which the boat is fitted. One sounds unlike the others. He shines his bull's-eye around it, tries it again; it moves; a little manœuvring, and off it comes, the inner side cut out, and the tank filled up with cake-tobacco. He passes the word to his chief; a rough estimate shows the weight to be about four pounds. The master of the vessel is apprised, and the deck-hands—one of these it must be—are mustered. To whom does the tobacco belong? Some one must own up, or all will suffer dismissal; these are the owner's orders. There is no long hesitation, for probably every one of that hard-bitten group knows the sinner. Of him who admits the offence they will think none the less, but for a period he must seek new mates on another ship. He declines to pay the heavy deposit of nearly four pounds sterling that the officer requires, preferring to go to court with the prospect of a reduced fine, and fortified by the knowledge that few regard the offence as a breach of any of the ten commandments.

But smuggling has been robbed of all its romance in these decadent days. No more does the lugger dodge off the convenient creek awaiting nightfall to run her cargo of hollands or silks or chests of tea. Last year only four seizures of over one hundred pounds of tobacco and cigars were made. The total number of seizures amounted to nearly five thousand; but they averaged only a trifle over two pounds each. The business has, in fact, become too petty for a man of spirit.

We have been reviewing the work of the water-guard branch of the Customs, described in happy phrase by the late Lord Goschen as 'the first line of defence.' Its chief duty is that of revenue protection. To determine the amount of revenue to be collected is the principal business of the landing staff. These two branches, however, are not separate and disconnected entities. We have seen the water-guard officer collecting duty, and in like manner we shall see the landing officer acting in a preventive capacity.

We must now make a fresh departure in our narrative. The taxable commodities in the holds of the vessel are, after all, the real source of our Customs revenue, the amount collected from passengers being a quite inconsiderable percentage of the total. How the duties on these commodities are assessed will be our next inquiry.

It is the legal duty of a shipmaster, within twenty-four hours of his arrival, to 'report' his vessel at the Custom House; and as no cargo can be discharged before this is done, he usually makes this his first business on shore. The 'report' is a statement giving in brief a description of the goods brought in the vessel from abroad. But the master is merely the carrier's representative; he is unable to give the full particulars which the Customs demand. It is, therefore, required of the actual importer that he shall furnish an entry of the goods in detail. The two documents, master's report and importer's entry, together provide a twofold check and safeguard against illicit importation. The entries, on being

received and checked at the Custom House, are forwarded to the landing officer, who, as we join him, is engaged in the examination of the non-dutiable portion of the cargo. Only a percentage of the packages entered as containing free goods are inspected, but for obvious reasons the officer himself must select the particular packages to be examined. As the 'openers,' the cases challenged by the officer, are landed, they are set aside and opened by an attendant cooper. From one package to another, the contents of which have been sufficiently turned out, the officer passes comparing the particulars on the entries—that is, marks, description, and value—with the goods themselves. On the accuracy of these entries depends the reliability of the Board of Trade statistics, and he must therefore rapidly and roughly check them as he proceeds, calling for the production of invoices or other evidence of quantity and value should he suspect error. His subordinate, armed with several steel wires of various lengths, is meantime 'spitting' packages containing goods which will not suffer injury by these wires being thrust into them. The 'spits' are grooved or notched, so that a tiny portion of the contents can be withdrawn and submitted to test by eye or nose—the latter a valuable organ for Customs purposes. Casks are pierced in head or bilge, or the bung removed; and should the nature of the contents be doubtful, samples are taken and the goods placed under detention until an analysis has shown that they are not dutiable.

The free goods officer's duties comprise, besides the purely revenue work of detecting dutiable goods entered as free—of which there are very few instances—a vast amount of important non-revenue work, such as the check for statistical purposes already mentioned; the detention of foreign goods bearing British trade-marks or misleading descriptions as to the country of their origin; the seizure of copyright works, indecent articles, and lottery advertisements; and the sampling of dairy produce (butter, cheese, and milk), which is subsequently analysed at the Government laboratory to ascertain whether the legal standard of purity has been conformed to. To these have recently been added the detention of unsound foods and certain kinds of foreign meats which before delivery must be inspected by medical experts. It will be admitted that such a range of duties provides no light task for an officer with a due sense of his responsibilities.

A colleague has been detailed to examine the dutiable goods landed from the vessel. With a set of gauging-rods he is taking measurements from which the contents of the casks of spirits can be calculated, a task of great nicety, and one which requires long experience for its proper performance. Much depends on the officer's skill in this part of his business, not only because it affects the revenue, but because it concerns the owners of the goods, for wines mostly and spirits generally are sold on Customs gauge. From each cask he draws a small quantity—afterwards returned undiminished, it may be added—and by the use of a thermometer and a hydrometer (a spherical instrument with graduated stem which indicates the specific gravity of the liquid) the strength of the spirit is found. Samples from casks of rum, brandy, and wine are sent to the laboratory to be distilled and the alcoholic content ascertained, for the colouring or sweetening matter contained in these liquors affects the action of the hydrometer.

Cases of brandy are opened, the bottles counted, the contents of several measured, and the strength ascertained. Chests of tea are sent in locked vans to a bonded warehouse; each chest will there be weighed and a deduction made for the weight of the empty package. Hogsheads of tobacco are weighed and then carted off to the huge tobacco warehouses where thousands of similar packages are stored. They will be allowed to stand for a month or two before the official net weight is taken, for the tobacco is quite moist, and the owner naturally does not want to pay three shillings a pound on the water with which the tobacco-leaf is saturated. Cases containing scores of boxes of cigars of all sizes and weights are turned out, assorted, and a careful inventory taken; then a percentage of the boxes are emptied and weighed to ascertain the weight on which duty is to be charged. And so on throughout the whole of that portion of the cargo on which duty is leviable, a careful account being taken in appropriate books. Goods upon which the duty has been paid at the Custom House when the entries were passed are delivered out of charge as soon as the examination has shown that the amount paid covers the quantity found by measurement or weight, any overpayment being returned later.

Goods intended to be stored in warehouse may be removed after bond has been given that they shall be produced intact to the officers there stationed. Some of these will in time be wanted for the home market, and then the duty will be paid; others will be exported without any duty having been levied. Certain parcels may be intended for transhipment, and these (proper precautions being taken for protection of the revenue) are conveyed from the importing vessel to the export ship or sent by rail to another port for shipment. All the cargo having been landed, the rummagers give the ship a final overhaul, and she is then at liberty to take on a fresh cargo.

A few words must suffice for the clerical branch, the third main section of the Customs service, who are located in the Custom House. The collector, an important official who represents locally the Board of Customs, and who exercises disciplinary control over the whole of the local staff, has his office here. In his name certain clerks receive payment of the duty on the goods to be cleared from the ship's side or to be delivered from the bonded warehouses. One feature of revenue collection is that no one gets credit; money down or do

without the goods is an invariable rule. The clerical section also exercise a check on the results of the practical work of the outdoor officials, and by the interaction of the two branches absolute surety is guaranteed that all duty receipts shall find their way to the Old Lady of Threadneedle Street, who keeps the nation's purse.

The administration and management of the Customs is vested by the Crown in a board of commissioners, with headquarters in the London Custom House. Here are also stationed the secretarial and inspecting staffs, who promulgate and see to the carrying out of the Board's directions by the army of Customs officials, some four thousand strong. These officials are mainly at the larger ports, smaller stations being dotted along the whole length of the seaboard fringe of Britain, with a patrol of coastguardsmen covering the stretches of coastline unbroken by frequented harbours. It is a force that never sleeps, that knows neither night nor day. The doors of its central Custom House are never closed, for only by unceasing vigilance can the revenue interests of this great maritime nation be completely safeguarded.

Such, in broad outline, is the story of the tariff in action. That schedule of dutiable articles is the mainspring of the activities of the Customs service. It delimits the officer's area of operations; his interests are bounded by its contents. The tariff has a peculiar potency, for there is no inhabitant of these islands but feels its effects. Amongst the tariffs of the world, our own is unique by reason of its shortness and simplicity. It is simple, since British Customs duties are levied at specified rates either on the weight or measure of the goods chargeable. No protection for home manufacturers is afforded by the tariff as at present framed, for when a Customs duty is imposed on an imported article an equivalent Excise duty is levied on like articles made in the United Kingdom, the two schemes of duty being complementary. Thus the Customs duty of eleven shillings and fourpence per gallon on brandy and rum is balanced by an Excise duty of eleven shillings on whisky, the difference representing the cost which Government restrictions impose on British distillers.

Tariff articles fall into four principal groups: what has been described as the breakfast-table duties on tea, sugar, coffee, chicory, and cocoa; the dried-fruit group—raisins, currants, figs, &c.; the alcoholic group, consisting of wines, beer, and foreign spirits of all kinds; and the tobacco division, which includes the unmanufactured leaf as well as the finished products, cavendish, cigars, and cigarettes. These four principal groups are subdivided into a number of minor classes, the liability to duty of the articles in each class arising from their containing as a part or ingredient some one or other of the principal group articles. Foreign-made playing-cards bear a tax of threepence three-farthings a pack, as a set off against the Excise duty of threepence.

No leading principle seems to be followed in fixing the rates of the several Customs duties. While the duty on brandy is eleven shillings and fourpence the gallon at what is known as 'proof' strength, the rate rising and falling in exact proportion to the alcoholic content of the liquor, the duty on wine, a competing beverage, is one shilling and threepence the gallon, provided it contains not more than 30 per cent. of 'proof' spirit, and three shillings if it exceeds that strength. A simple calculation will show that the wine-consumer pays for the proof spirit in his beverage a little more than one-third what the brandy-drinker pays for his. Tea, again, which at present is taxed at fivepence the pound, may be reduced or increased in rate according as the Chancellor finds himself in funds or otherwise; but the duty of twopence per pound on the alternative drinks of cocoa and coffee never alters. Continental experts who delight in scientifically framed tariffs must marvel to see us trample through their theories of equipoised rates. Whether we shall abandon these hap-hazard methods to fall into line with other nations, broadening the range of our tariff and utilising it for other than revenue purposes alone, is a question which may have to be settled soon.

THE AWAKENING OF JOHN HAVISHAM.

By T. W. Hanshew.

IN TWO PARTS.—PART I.

HERE is no alarm-clock so efficacious as the tooth of Hunger sharpened by the file of Poverty, and Havisham had eaten next to nothing for three days.

He kicked off the bedclothes and felt his way through the darkness to the window. Surely it must be morning by this time! It seemed ages since he flung himself on the bed, dressed as he was, and, after a long fight with his tingling nerves and obstinately defiant senses, dropped off to sleep, and persistently dreamt of all the torturing things he most wished to forget. He pulled back the frayed woollen curtains, pushed up the creaking sash, and leant out into the raw dampness of the young morning. The faint lilac glow of approaching dawn was just visible in the east; the early-risen sparrows cheeped querulously in the square below, and an amorous pigeon cooed under the eaves of a house across the way.

Havisham looked up at the blurred sky and peevishly cursed the slow coming of the tardy

light. It would be a good hour yet before it was clear enough to set his palette; for although he had a bit of candle in the cupboard, he was chary of using it. Not from any 'saving' principle, however, but because the artificial light was not conducive to the proper mixing of colours, and he had such a scant quantity left that waste now meant the ruin of his new-found hope.

Hope! The very thought made him smile grimly. So it had come to this—had it?—that he, John Havisham, the once prosperous R.A., who only five years ago was in a fair way to become a fad with the fashionable set, had dropped to the point of building hope on the promise of a chance-acquaintance met after midnight at that momentary mooring-place of the human derelicts of London, a kerbstone coffee-stall!

It wasn't the sordid old story of drink that was at the bottom of it; for Havisham was never at any time, even now, what might be termed a drinking man; neither were cards, women, nor vice of any sort accountable for his fall. The matter was one of temperament alone, and the fate which overtook and encompassed him no man might have foreseen, and none but God could have averted.

The fresh smell of the waking world, the cooing of the pigeon, the hour of waiting for the widening light, all were conducive to retrospection, and he mentally took up the jagged bits of wreckage and pieced them together again.

In what had he failed? By what subtle necromancy of Fate had his steps slid down the ladder whilst he was still toiling upward, still faithful to his ideals, still bent upon achieving higher things? The thing was a mystery to him, had been a mystery to him always; and, looking back upon the varied fabric of his life, he could find no clue to it.

For the most part it had been the ordinary life of the ordinary art-student, who sets out to make a career, with boundless faith in himself and a very limited supply of money and influence; a long siege of hard study and rigid economy; then a won scholarship, that greased the wheels a little, and made possible the rise of those who were fitted to rise; then more hard study and the bulldog determination to succeed, backed in Havisham's case by a touch from the hand of genius; another scholarship, a competition, a gold medal, acknowledgment by the Press, praise from the public; then election to the Academy, the sale of a picture to the nation, and the vindication of his belief in himself and of Nell's excited prophecies regarding him.

Nell! The very thought of her set all the silent strings of memory jarring discordantly. It was she who brought home to him the news of his greatest victory. He could see her and hear her now as she dashed in that day, and, half-hysterical with happiness, threw herself upon his neck and hugged and kissed him, crying out between laughter and tears, 'The Chantrey Bequest! the Chantrey Bequest, Jacky darling! They're going to buy "Ariadne in Naxos" for the nation—the nation! Lipscomb told me—Lipscomb, so there isn't any mistake. Oh Jacky, kiss me! I knew you'd do it! I always *knew* that you would!'

Followed a dull wrench, as though some sleeping thing within him waked and cried with the coming of that memory. Havisham groped for his pipe, filled it, lit it, and smoked hard and fast, with the dove's croon in his ears and his face set grimly towards the waking east.

'I was only one-and-twenty—the fool's age, when Wisdom is the suckling and Folly the nurse,' he muttered apologetically. 'I was only nine-and-twenty when she brought me that news, and we'd been married eight years. Faugh! what a pair of idiots we were!'

Still, it had been a happy sort of idiocy while it lasted; and what dreams they had indulged in! And how they had worked and hoped and built air castles together—she, of her success on the concert-stage, when the long, tiresome drudgery of scales and exercises and never-ending practice was over; and he of the day that came when the nation purchased 'Ariadne in Naxos.' And, on the strength of those hopes, in the promise of those dreams, they had married, because there seemed no sense in putting it off until success was really won when they were so necessary to each other, and it was so much cheaper to pay for one set of rooms than for two.

How gloriously she used to sing in those days! What a marvellous voice she had, what flexibility, what compass, what quality! Almost, he felt surer of her success than of his own; and sometimes—yes, he could acknowledge it now, when his belief in himself had been put to the sword, and all those days of dream were over and done for—sometimes the vaguest shadow of fear, the tiniest wound to his *amour propre*, used to steal over him with the thought that perhaps some day her greatness might eclipse his own, and leave him standing in the pale light of *reflected* glory.

Was there something of that, he wondered, lying at the bottom of the stand he took when fame came to him and the 'Ariadne in Naxos' was purchased for the nation? Or was it, as Lipscomb had said, that he was 'afflicted with a bad attack of swelled head, and took himself too seriously'?

Even at this late day he didn't like to think that either reason was the real one. He liked to believe that what he said at the time was true: that he didn't want people to think he wasn't able to support his wife without some effort upon her part towards the upkeep of their establishment; that it wasn't consistent with his new position in the world for her to appear as public singer, and he didn't mean to countenance it. And that, too, on the eve of her proposed début, when eight-and-forty hours more was to usher in the moment she had been preparing for, studying for, hoping for, living for, since the day she was fourteen!

He caught up a broken tumbler and dashed it

down into the square with all his force. The shrill notes of the warring sparrows annoyed him; there was something in the sharp bleakness of their screaming that reminded him of the queer, uncanny cry *she* had given when he told her of his decision, something in the jarring babel that recalled the fierce quarrel and the swift passage of angry words that followed. And the end of it all was just such a silence and emptiness as came now, when the frightened sparrows fled and left the square vacant and voiceless. Only that the sparrows would come back some time, but she never did.

He had told her that if she defied him she might go her way, and need not trouble to think about returning; and she had taken him at his word and gone. He never knew where, only that she appeared as she had been advertised to appear; that, in spite of all the promise of other days and all the prophecies of her instructors, she failed miserably; that the critics said of her, 'She sang without feeling or expression, her voice was colourless, her execution faulty, and her phrasing distinctly bad.' And after that—nothing. Her star set in the moment of its rising, dropping suddenly into the darkness of utter oblivion, and going out at its brightest like a spark that had fallen into the sea.

When the hot fires of his anger had burnt themselves out, Havisham—a little ashamed of himself and of the harsh measures he had adopted—went in quest of her. But if any man knew what had become of her, that man he never found. A pricked bubble could not have vanished more completely, and last summer's roses or last winter's snow were not more surely lost than she.

Resentment followed the quick flush of remorse which had sent Havisham out in quest of her; but that in time gave place to a dull, steady ache which, in its turn, died down as the months crept by to a hopeless sort of indifference which somehow reflected itself in his work.

His descent of the ladder was rapid. The very first picture that went forth from his easel lacked inspiration, the critics said; his next they declared to be utterly devoid of that mysterious something called 'soul;' and by the time he had turned out his third even his most ardent admirers began to shake their heads gloomily and talk about 'a decided falling off.'

It wasn't that his brush had lost its cunning; it was simply that his imagination had failed him. His subjects were conventional and treated after the manner of the student, not the master, lacking everything that made for depth and breadth and originality. Somehow, all his women looked alike—pale, dreary, hopeless-eyed ghosts of that other woman who had gone out of his life, and bearing in their blank eyes and drawn mouths something of the expression which had clung to hers that time he told her she was to give up her career.

He couldn't see it himself. He was merely conscious that something was wrong with the work; that, strive as he would, he couldn't get the effect he was after; that his brush ruled him, not he his brush; and that he was obsessed by some uncanny thing, some weird, some monstrous Other Self that *would* paint its personality into every imaginary picture he evolved.

Two years of this hopeless martyrdom to the Thing that possessed him—with not a picture sold, with all his efforts for both Academy exhibitions rejected uncompromisingly, and not a single 'order' on his list—used up his surplus, and filled him with a sense of nervous fright that made his next picture worse than any of its predecessors; and in a sort of panic he determined to abandon the purely imaginary for a time, and to go in for portraiture. Surely, with a 'sitter' present, he couldn't fail to put down what was before him.

But a bitter awakening came after the fourth portrait had been thrown back upon his hands with the same set form of rejection, namely: 'Lady Landover presents her compliments to Mr Havisham, and begs to remind him that she sat for a portrait of herself, and there appears to be nothing in this one resembling her or any person of her acquaintance. It is, in fact, with the exception of the costume, which her ladyship identified as hers, and considers most charmingly painted, an exact replica of the hopeless-eyed portrait which Mrs Somerby-Myers rejected last week as a libel upon her; and Lady Landover begs to inform Mr Havisham that there is not the slightest trace of a resemblance between Mrs Somerby-Myers and herself.'

From that on, the descent of the ladder was rapid indeed. He slipped out of Mayfair, and was forgotten by it before he had been gone a month; he turned from oils to black-and-white, and went in for illustrating books, magazines, anything that came to his hand; but after a publisher had accepted and produced one of his drawings, he never took any more. And from all quarters came the one report: 'Very charming, and all that, you know; but, really, my dear fellow, we can't go on taking the same face for ever. And such a dreary, hopeless-looking face, too. It's enough to give the public the creeps to look at it. Very sorry; but you needn't trouble to submit anything more.'

And so, down the ladder lower still; until even the 'penny dreadfuls' found the same cause for complaint, and dropped him. Then—with a change of name—to the miserable end of hawking drawings about at race-meetings and public-houses, or for a sixpence to make sketches at coffee-stalls, and even chalk drawings on the pavement. He could go no lower now; he had come to the very bottom of the ladder at last; and there, on the lowest rung, Hope had found him last night.

A conversation—born of admiration for the way he handled his material and went about his work—had led to a stranger who had stopped at the coffee-stall confessing that 'he did a bit in that line himself,' and asking Havisham if he was in the way of making a little by doing a bit of faking. 'Gent I

know of—German he is, and comin' over from Berlin to-morrow,' he imparted in confidence—'is fair mad on gettin' hold of some of the early drawin's of a party named John Havisham. Used to be a tip-topper, *he* says, though I'm free to admit as *I* never heard of him. Well, my German friend thinks there must be some of his early things a-kickin' round somewhere; and, as he's got plenty of the needful, why couldn't you and me lay our heads together and fake up somethin' for him?'

'It isn't necessary,' replied Havisham. 'I'll give him some real ones.'

'Gawd's truth! *you* ain't got none of 'em, have you?'

'No; but I'll make him some if you'll bring him round to my digs to-morrow afternoon. It just so happens that *I* am John Havisham—if you don't mind keeping it to yourself about here.'

'My word, but *you'll* do!' said the other, with a wink and a grin. 'Aren't it a lucky thing, though, that my German friend aren't after a Turner or a Landseer? Right you are, old chap! Gimme the address and I'll fetch him round. But mind! I'm to come in for a third for steerin' of him—that's only fair. And, look here, if you lives to see any glove-boxes or the like a-comin' out of Germany with original Havishams on 'em, mind you don't get tiddley and blow the gaff.'

'I never get tiddley; I'm not built on those lines,' replied Havisham, seeing that it would serve no purpose to argue the point of his identity with this sceptical individual. 'As for the rest, I agree to everything. Bring the man round to-morrow about four or five in the afternoon, and I'll have what he wants ready for him. And signed, too, so there'll be no mistake about them.'

After that they had parted, and Havisham had gone home to his lodgings, to his troubled sleep, to his sudden awaking, and to this dull hour of brooding in the gray of the wintry dawn.

He smoked on, fast and furious, letting the hopes that were born last night mingle with the dead dreams of yesterday; smoked, and thought, and wondered, and watched the lilac tints fade, and rose and gold, saffron and silver, lattice the transfigured east and usher in the morning.

Came a sharp awakening, a sudden wrench back from dreams to actualities. The sparrows were back in the square, quarrelling and flicking about as before; the voices of life muttered through the city's sleep, and the whole sky was overlaid with light. The hour of retrospection was over and day was here.

Havisham set up his easel and spread his palette, and gave brush to the things the dawn had awakened in him.

He chose water-colours this time, because they would dry faster and allow of his having plenty of subjects ready for the coming purchaser; and as picture after picture grew under his hand, and was signed, and laid aside, something of the old-time enthusiasm got into his blood and inspired him with the glory of creating. He painted and painted and painted for ten successive hours, never leaving his seat, save when, twice or thrice, as the day progressed, he got up to tighten his belt a hole or two to lessen the uneasy gnaw that was nature's appeal for sustenance.

And so he was still sitting and still painting when, at five o'clock, a sharp rap sounded on the door, and, in answer to his call, his last night's coffee-stall acquaintance came in, bringing a well-groomed, prosperous looking German with him.

Havisham got up, shaking a little with the chagrin and surprise that seized him as the would-be purchaser entered, and across the narrow width of the shabby room the eyes of the two men met.

'I think we scarcely need any introduction, Mees-ter Havisham,' said the German quietly. 'We have met before, I believe.'

'Yes,' said Havisham, the deep redness which had come over his face at first fading out into a sickly, putty-like pallor. 'It was when your firm wanted to purchase Continental reproduction rights to the "Ariadne in Naxos" for use as a chromo on a shilling fire-screen, I believe. I wasn't over courteous to you, I recollect, and I didn't relish the idea of coming down to colour-print. Well, I'm not so particular nowadays, you see. Here are a few things—good things, I think; take your pick of them. We sha'n't haggle as to price.'

Herr Steinmetz walked over to the bed, where the paintings lay spread out side by side, and, taking them up one by one, examined them critically, and laid them down in silence.

'Well,' said Havisham irritably, 'what do you feel like offering me for the lot? Or, possibly, there are only one or two that you want. We sha'n't quarrel over figures. What are they worth to you?'

'Sir,' replied Herr Steinmetz, turning with a shocked and grieved expression in his eyes, 'I regret to say that they are not worth one farthing to me, any of them.'

Havisham neither spoke nor moved nor made any sound; but the pallor on his face went grayer and grayer, until his very lips were like wax.

'They are not like the work of the brush that painted the "Ariadne"—not at all like,' said Steinmetz, with a note of sorrow in his voice. 'They are weird; they are uncanny; they are nightmares put into paint; and the agony on the faces of them is enough to wring the heart. This that you call "The Goddess of Love," she is the very Spirit of Despair; and in the faces of the Cupids about her'——

'Never mind going into details,' interrupted Havisham in a lifeless sort of voice. 'The point is that you don't want them; that you can't make any use of them, I suppose.'

'Nobody could. I speak plainly—nobody! I am sorry—I am deeply sorry. I had hoped——

But that does not matter. One lives to see one's hopes destroyed so often.' His eye went round the shabby room and took in its every detail. 'If you will permit me to retire, and will give me the small pleasure'——

A sovereign clinked on the bare top of the table as he laid it down as softly as he could. He looked at Havisham, and saw that he was staring at the rejected paintings, and neither heard nor knew; then, with a gesture to the man who had piloted him there, and a backward glance at that other man standing motionless beside the bed, he went quietly out and closed the door behind him.

(To be continued.)

THE CHARM OF THE CHEVIOTS.

THE fine mountain ridge of the Cheviots, extending for over thirty miles along the Border-line between England and Scotland, has been strangely neglected, although one of our latest guide-books calls the Border Country the most interesting in the whole world. In his lecture on the Wardens of the Marches, Dr Hodgkin tells us that few realise all the majesty and mystery of the Cheviots; and Professor James Geikie, who in 1876 gave in *Good Words* an interesting series of articles on the range, points out that the scenery is of a kind that grows upon one. 'It shows no clamant beauties; you cannot have its charms photographed; the passing stranger may see nothing in it to detain him; but only tarry for a while amongst these green uplands, and you shall find a strange attraction in their soft outlines, in their utter quiet and restfulness.' We have put this to the test, and have seen from slopes and hill-tops some of the finest panoramic views in the country. The hills in their wavy outlines are unlike the picturesque, sharp, and ridgy monsters of the Scottish Highlands; but, like the hills of Yarrow and Ettrick, they have a 'sonsy, good-humoured, buirdly look,' these great, 'round-backed, kindly, solemn hills.' They are a happy hunting-ground for the archæologist, and Geikie gives a list of over fifty old British camps, entrenchments, forts, and tumuli on the Scottish side alone. The footprints of the Romans may be traced at the stations of Bremenium (Rochester) in Redesdale, at Chew Green, and Cappuck on Oxnam Water, as well as along Watling Street. Scenes of battle and skirmish may be recalled at Flodden, Otterburn, Milfield, Piperden, or Reidswire; while the ancient castles of Cessford, Ford, Etal, Wark, Twizel, Norham, and Berwick recall the old days of warfare between England and Scotland. For the angler there are many good streams, while the pedestrian is free to wander whither he will over hill and valley.

The manager of one of the leading Scottish railways once said that Sir Walter Scott had given them their best advertisement. He was here also, we find. 'He was makin' himsel' a' the time,' young Walter Scott's friend Shortreed truly remarked regarding the Border excursions of the future poet and novelist, who distinctly traced (1791) to his residence with an uncle at Rosebank, in Kelso, the awakening of that delightful feeling for the beauties of natural objects which never afterwards deserted him. This Border town he thought the most beautiful, if not the most romantic, in Scotland. William Jerdan, editor of the *Literary Gazette*, who was born here, in a house overhanging the Tweed, opposite the confluence of the Teviot with that river, says much the same thing. It was during the Kelso visit of 1791 that Scott, a youth of twenty, first became familiar with the scenery of the Cheviots, and their north-east outlier Flodden ridge, scene of the battle of Flodden, which gave a setting to some of the most effective descriptive passages in *Marmion*. In the autumn of 1792, there is a passage in a letter to his friend William Clerk which every reader must have wished much longer: 'Some days ago I had nearly met with a worse accident than the tramp I took at Moorfoot; for, having bewildered myself among the Cheviot Hills, it was nearly nightfall before I got to the village of Hownam and the passes with which I was acquainted.' Hownam is a lonely hamlet on Kale Water (an excellent trout-stream), with a church, school, inn, and half-a-dozen houses. The Roman Watling Street passes northward from the Cheviots, two miles away. It is very easy to get bewildered in the heart of the hills, as we found while descending from the top of Cheviot by a precipitous rift, the Bizzle, which landed us in College Burn, Northumberland. A young shepherd left Hownam on the night of 15th December 1874 for the farm on which he was servant, on the English side, but perished in a snowstorm near Blindburn. Though a search was made for him day after day, some weeks passed before the shepherd's body was found and buried in Hownam churchyard, 15th January 1875, where a monument has been erected to his memory by brother-shepherds.

We are fortunate in having Scott's account of a very pleasant residence at the farm of Langleeford, on the Wooler path to the top of Cheviot, from which it is distant three miles. The farmstead of Langleeford is mentioned in connection with Border night-watches in 1552. A watch used to be stationed on certain hills and fords on the Scottish and English Border-line.

The route through the Cheviots taken by Scott and his uncle was evidently what is known as the Stawe road, once much frequented by Yetholm gipsies passing to Boulmer, on the Northumberland

coast, for smuggled gin, in which a great trade was done.

'To WILLIAM CLERK, Esq.,
Princes Street, Edinburgh.

'NORTHUMBERLAND, *26th Aug.* 1791.

'DEAR CLERK,—Behold a letter from the mountains, for I am very snugly settled here, in a farmer's house, about six miles from Wooler, in the very centre of the Cheviot Hills, in one of the wildest and most romantic situations which your imagination, fertile upon the subject of cottages, ever suggested. And what the deuce are you about there? methinks I hear you say. Why, sir, of all things in the world—drinking goat's whey. Not that I stand in the least need of it; but my uncle having a slight cold, and being a little tired of home, asked me last Sunday evening if I would like to go with him to Wooler, and I answering in the affirmative, next morning's sun beheld us on our journey through a pass in the Cheviots, upon the back of two special nags, and man Thomas behind with a portmanteau and two fishing-rods fastened across his back much in the style of St Andrew's Cross. Upon reaching Wooler we found the accommodations so bad that we were forced to use some interest to get lodgings here, where we are most delightfully appointed indeed. To add to my satisfaction, we are amidst places renowned by the feats of former days; each hill is crowned with a tower, or camp, or cairn, and in no situation can you be near more fields of battle: Flodden, Otterburn, Chevy Chase, Ford Castle, Chillingham Castle, Copland Castle, and many another scene of blood, are within the compass of a forenoon's ride. Out of the brooks with which these hills are intersected we pull trouts of half a yard in length as fast as we did the perches from the pond at Pennycuick, and we are in the very country of muirfowl.

'Often as I have wished for your company, I never did it more earnestly than when I rode over Flodden Edge. I know your tastes of these things, and could have undertaken to demonstrate that never was an affair more completely bungled than that day's work was. Suppose one army posted upon the face of a hill, and secured by high grounds projecting on each flank, with the river Till in front, a deep and still river, winding through a very extensive valley called Milfield Plain, and the only passage over it by a narrow bridge, which the Scots artillery, from the hill, could in a moment have demolished. Add that the English must have hazarded a battle while their troops, which were tumultuously levied, remained together; and that the Scots, behind whom the country was open to Scotland, had nothing to do but to wait for the attack as they were posted. Yet did two-thirds of the army, actuated by the *perfervidum ingenium Scotorum*, rush down and give an opportunity to Stanley to occupy the ground they had quitted by coming over the shoulder of the hill; while the other third, under Lord Home, kept their ground, and having seen their king and about ten thousand of their countrymen cut to pieces, retired into Scotland without loss. For the reason of the bridge not being destroyed while the English passed I refer you to Pitscottie, who narrates at large, and to whom I give credit for a most accurate and clear description, agreeing perfectly with the ground.

'My uncle drinks the whey here, as I do ever since I understood it was brought to his bedside every morning at six by a very pretty dairymaid. So much for my residence; all the day we shoot, fish, walk, and ride; dine and sup upon fish struggling from the stream, and the most delicious heath-fed mutton, barn-door fowls, poys, milk-cheese, &c., all in perfection; and so much simplicity resides among these hills that a pen, which could write at least, was not to be found about the house, though belonging to a considerable farmer, till I shot the crow with whose quill I write this epistle.'

What a procession of other distinguished and undistinguished people has passed the Border-line and the Cheviots, coming and going between England and Scotland — kings and shepherds, freebooters, smugglers, and farmers! Now the main arteries of traffic are the three great railways, which, except in the case of the Waverley Route, avoid this great mountain ridge between England and Scotland. James Thomson, the poet of the *Seasons*, found scenery and illustrations for his 'Winter' on the slopes of the Cheviots, and a hospitable welcome always, as Allan Ramsay had, from Sir William Bennet of Marlefield. Daniel Defoe climbed Cheviot from the Wooler side in 1728. Although a lame man, Thomas Pringle, born at Blaiklaw, between Yetholm and Kelso, was not a lame poet. Coleridge said of his 'Afar in the Desert' that it was one of the two or three most perfect lyric poems in the language. He was one of William Blackwood's early, if not most successful, scribes; a pioneer in settling Border families on land at the Cape; and secretary of the Anti-Slavery Society. A college companion of Pringle's was Robert Story, son of the Yetholm parish schoolmaster, and well known as the minister of Roseneath; and his son, better known as Principal Story, was long a conspicuous figure in Scottish Church Assemblies. James Dodds, a clever parliamentary solicitor, author of *The Fifty Years' Struggle of the Scottish Covenanters*, was born at Softlaw, near Kelso. William Fairbairn, the great engineer, was a native of Kelso; and from Kelso Scott brought John and James Ballantyne into notice as printers and to the Scottish capital. The family from which Captain Cook was descended came from this district, as did the Rev. F. H. Lyte, the hymn-writer. The father of George Stephenson, the railway engineer, was the son of a farmer on Oxnam Water, who crossed the Cheviots to get work at the coal-pits near Newcastle. The name of Paulinus, first Archbishop of York, survives

in Palinsburn, and there is a memorial well and inscription to his memory at Holystone on the Coquet.

To the late Lady Waterford, while resident at Ford Castle, the country was strangely interesting. She wrote in 1862: 'I have greatly enjoyed discoveries of walks and scrambles in the Cheviots, they are so beautiful, though perhaps too park-like.' She renovated Ford village and the castle built by Sir William Heron in 1287, where James IV. lingered all too long with Lady Heron before the battle of Flodden; she also built a model school, and decorated it with frescoes illustrative of the 'Lives of Good Children.' The faces were taken from the children around her, and the models for Cain and Abel might be seen, slate-pencil in hand, for several years under their own portraits. The impress of her hand and heart is all around still, on the cottages with their brilliant gardens of flowers, the beautiful walks, miles of drive on Flodden, with its wooded hill and Marmion's Well. The monument to her husband, with its tall red pillar and angel-figure standing out against the sky, Augustus J. C. Hare thought worthy of Perugia. He was at Ford while writing Murray's Guide to Northumberland and Durham, and thought the whole country wild and poetical, with its deep wooded valleys, rugged open heaths, wind-blown pine-woods, 'and pale-blue distances of Cheviot Hills.' Josephine E. Butler, author of the Memoir of her father, John Grey of Dilston, and of a Memoir of her husband, Dr George Butler, retained a strong affection for Milfield, on the Northumbrian side of the Cheviots, where she was born. Mrs Butler recalled how broken pieces of armour belonging to men and horses would sometimes be ploughed or dug up on the battlefield of Flodden, to be treasured up as relics. Biddlestone Hall, the ancient seat of the Selbys, said to be the Osbaldistone Hall of Scott's *Rob Roy*, is on the Coquet; as also Harbottle Castle, where was born, in 1515, Lady Margaret Douglas, who afterwards was Countess of Lennox, mother of Lord Darnley, and grandmother of James I. of England.

An old coach-road between England and Scotland is that over Carter Fell. The traveller who crosses the Border by any one of the three main lines of railway can have no conception of the splendid prospect which breaks on the vision from the Newcastle road crossing the Carter, a long, flat-topped-looking hill, about two thousand feet high. We had the view once at sunrise, and shall never forget it. In the foreground is the vale of Jed, towards Jedburgh; farther away, the rich valley of the Tweed, the Eildon Hills, the distant Lammermoors. Hugh Miller, who travelled on the top of the Newcastle coach in the autumn of 1845 across the Borderline, recalled how vast an amount of blood and suffering had been expended by the weaker against the stronger nation to make that line good: 'It wore to-day, in the quiet sunshine, a look of recluse tranquillity, that seemed wholly unconscious of the past. A tumbling sea of dark-green hills, delicately chequered with light and shadow, swelled upward on either side towards the line of boundary, like the billows of opposing tideways, that rise over the general level where the currents meet; and, passing on and away from wave-top to wave-top, like the cork baulk of a fisherman's net afloat on the swell, ran the separating line. But all was still and motionless, as in the upper reaches of the Baltic when the winter frost has set in.' Recently a miniature lake has been formed at the top of Redesdale, at Catcleuch, part of Newcastle's water-supply. Lower down the valley is Rochester, the Bremenium of the Romans; the camp there, which can still be traced, was described in *Chambers's Journal* for 1890, in an article, 'A Roman City in the Cheviots.' One of the inscribed altars discovered here had this inscription: 'To the Genius and Standards of the First Cohort, the faithful of the Varduli, Roman citizens, cavalry, a thousand strong. Titus Licinius Valerianus, tribune, erected this.' The usual relics were found here suggestive of Roman occupation. Three miles north from the sweet village of Otterburn, on the hillside, stands Percy's Cross, about five feet high, set on a cairn of stones, which, tradition says, marks where Percy fell at the battle with Douglas. The ancient ballad of 'Chevy Chase' was founded on this battle. Scott gives the Scottish ballad, which concludes thus:

> This deed was done at the Otterbourne,
> About the breaking of the day;
> Earl Douglas was buried at the bracken bush,
> And the Percy led captive away.

To gain the full charm of the Cheviots one must wander along their grassy or heathery slopes, get lost in the folds of the billowy glens, and challenge the mountain winds from heights and hollows. Remarkably fine views of the Border-land may be had from Venchen, on the Wauchope estate at Yetholm, or from Stearough, on the other side of Bowmont Water. The whole valley of Bowmont is full of charm. At Bowmont's rise in the Cheviots there are traces of a large Early British population on the hillsides; and lower down is Yetholm (which is not one village but two, divided by the Bowmont), Kirk Yetholm being on the right and Town Yetholm on the left bank. The first has been for generations associated with a gipsy colony, which in 1797 numbered fifty, in 1818 one hundred and nine, and in 1846 one hundred and forty persons. The Rev. John Baird (1829–61) did much for the reformation of the gipsy. He was far from regarding the muggers and tinkers who dwelt here, perambulated the country, and turned up at country fairs with horses to sell, as the pure, unmingled gipsy race, wanderers into Europe from the East. The family of the Faas was believed to have been settled in Kirk Yetholm for a century and a half. A hundred years ago the gipsies carried on a brisk trade in smuggling from the Northumberland coast. Baird, with some exceptions, characterised them as 'a set of idle, worthless, unprofitable, deceitful, and dishonest vagabonds, with very few redeeming qualities. They hate all work; even the trades and occupations they follow are but an

excuse for idleness. They will rather want than work, and steal rather than want.' If the stranger now asks, 'Where are the gipsies?' he will be told there are none. Their residence here has left broad traces, and lowered the mental and spiritual temperature of the place. The influx of Irish hawkers has driven them from the road; the County Police Act prevents encamping, and the School Board looks after the children. The industries of the gipsies were the making of horn spoons, besoms, baskets, and the sale of pottery and horses. This picture of John Leyden's is now of the past:

> On Yeta's banks the vagrant gipsies place
> Their turf-built cots, a sunburnt, swarthy race. . . .
> With loit'ring steps from town to town they pass,
> Their lazy dames rocked on the panniered ass;
> Their bright black eyes through silken lashes shine,
> Around their necks their raven tresses twine.

In the Halterburn and Curr valleys there is a silence that may be felt, only broken by the bleat of sheep and the musical monotony of the hill-burns. Kale Water and Hownam are worthy, too, of exploration; as are also Cessford Castle, grand in decay, the ancestral home of the Kers of Roxburgh, and Linton Church, associated with the Somervilles and the legend of the killing of the Worm or Dragon. The Cheviot Hills proper extend from the head of the Tyne in Northumberland and of the Liddel in Roxburghshire to Yeavering Bell and the heights near Wooler, a distance of over thirty miles. The highest member of the range is Cheviot, a massive, broad-topped hill of two thousand seven hundred and sixty-seven feet, the top a dreary-looking moorland waste, coated with peat some fifteen to twenty feet thick in places, with ugly peat-holes here and there. Peel Fell comes next, and is one thousand nine hundred and sixty-four feet above sea-level. They are smooth, rounded masses, with long, flowing outlines, without peaks or serrated ridges, falling away in long, gentle slopes into England, and being more abrupt on the Scottish side. There are three routes to the top of Cheviot from Wooler, that by Langleeford farm (five miles) being most popular. Three miles more takes one to the summit. From Yetholm the ascent may be made by walking through the hills to College Burn; but this route is more difficult to find than the excellent road up Bowmont Water by Primside Mill, Belford, to Sourhope, some eight miles away. It is about five miles more by an easy ascent to the top, passing the green vale at Cocklawfoot on the right, and the huge mass of Cheviot on the left, with scarred front descending into the gloom of that gigantic rift known as the Hen Hole, where the peregrine nests, and from which issues the College Burn. Miss Russel of Ashiestiel derives the name of this rift from St Helena. In walking along the ridge towards Hen Hole we passed a shepherd's wooden shelter, with a window of observation to the north, and within materials for tea-making, a few old newspapers, a novel by Allan Raine, Haughton's *Precious Truth*, and a tattered *Chambers's Etymological Dictionary*. We found white heather in ascending, and quite a bunch at the top left by a previous climber. Before the summit is reached we pass Auchope Cairn, which marks the boundary between England and Scotland. A little to the south-east is the hanging-stone, marking the spot where a packman was strangled by his pack slipping over the edge and tightening the strap round his neck. The same story is told regarding a bridge between St Boswells and Earlston.

There are suggestions of history and romance in some of the Cheviot names, such as King's Seat, Lord's Seat, Battle Shield, Bloody Bush Edge, Bleak Law, Hungry Law, Windy Gyle, Wether Law, Lamb Hill, and Cushat Law. The shepherds are sober, shrewd, and hospitable, with a strong taste for religious disputation. The sheep-farms are in the hands of a few men, who generally do well.

Dr Hodgkin, in his lecture on the Wardens of the Marches, reminds us that the Cheviots, which are of the same geological period as the Pentlands, are monarchs of a most ancient line: 'Their masses of granite and porphyry were soaring high above the horizon—far higher than at the present day; then the Alps were undistinguished portions of the plain. The long tyranny of the Ice Age has struck off many a noble head, and has rounded off what remains.'

There is a noble view from Cheviot, provided the air be clear, of the whole seaboard of Northumberland, and of the country between Tweed and Coquet; and, on the Scottish side, Roxburghshire and Berwickshire are spread out like a map at our feet.

WALLFLOWERS.

> Why should it be that of all flowers which blow
> These most I prize?
> So many fairer, rarer blossoms blow
> 'Neath summer skies.
>
> I think it is because the brown and gold
> So bravely borne,
> And haunting ample scent with which they hold
> The early morn,
>
> Bring to my mind (ah, straggling garden-way
> And drowsy wings!)
> The grave abiding beauty of the day
> Of simple things.
>
> They bloom in cottage gardens 'midst the hives
> And fruit-trees fair,
> Hardy and homely as the peasant wives
> Who set them there.
>
> And though, amidst the riot and the glare
> Of noonday pride,
> Our vagrant choice applaud the gaily fair
> Which flaunt beside,
>
> When twilight falls upon the garden-ways
> And soft dews fall,
> Their scent recurring tells of love which stays—
> The best of all.

Chambers's Journal
SIXTH SERIES.

THE HEART OF THINGS.

By Henry Leach.

London, *Yesterday.*

NEW subjects of pleasant and intellectual interest and some general importance for dinner-table conversation are not plentiful at the present time. We become a little weary of all the failings of all Governments. The strong personal element and the romance seem to have gone out of politics; the nations jointly and severally seem to fear their fates, and to be constantly making preparations for the worst, and we are bidden to contemplate the possibility of Germans or Russians or both being in possession of our British homes, and behaving very disagreeably while there. In these circumstances it is an excellent thing that there is such rich material provided for what we may call the higher conversation in so many notable centenaries occurring in the present year. We have the most perfect excuse for opening the conversation at Mendelssohn or Charles Darwin or William Ewart Gladstone, and we are led on to a rich field of retrospect, bridging over a hundred years, and no doubt to some close comparisons of the respective values of the ancients and the moderns. We must realise what a centenary is. It is a thing made by man, not, like the day and the night and the seasons and the year, by Nature. It is purely arbitrary. Except upon the score of expediency—a hundred is an easy number to mark and remember, and it seems to denote the completion of a period—there is no more reason why we should celebrate things that happened just a hundred years ago than we should have celebrated the same happenings last year, or should defer our commemoration until 1910. But we must select our year, and so we choose the hundredth; and it has this considerable advantage and justification that in most cases the men who were born a hundred years previously have by then passed away from the stage of life for such a time that the historical perspective begins to get properly adjusted, and we judge of merits and demerits and reckon precise values when unencumbered with the prejudices and passions of the period during which these men lived and did their work. But if the century itself is just an arbitrary thing which we arrange for ourselves, the coincidence of several of these centenary celebrations falling at the same time is not, and it has to be accounted as most remarkable that, reckoning our standards of genius and merit as we do, so many of the men and women whose names we have agreed to place on enduring tablets of fame should have been born within such a little while of each other. Nature has her curious and mysterious workings which seem to abide by no law save that of action and energy following upon rest and recuperation. She has her lean years and her fat ones. From the earth she yields a fine abundance in some years, and is scanty in her supply in others. The vineyards have their good vintage years and their poor ones. Students of horseflesh know that there are years in the past which stand out from all others for the wonders that were then achieved in breeding. And it happens in just the same way that in some periods Nature gives forth a rich yield of men. We judge of the value of corn and grapes at the end of the season, of the horses in a few years. The quality of men is a more difficult thing to appraise, and it cannot be done by those who are exactly contemporaries without a varying degree of prejudice. It is well done a hundred years after their births and two decades or more after their deaths.

* * *

So now in this year we come to the consideration of the 1809 yield of men and women, and we find it to be the most marvellously rich one that we have ever known. Greater men have been born in other years; in fact, there is not one in this centenary group of whom it can be said that he was one of the greatest men who ever lived, having in mind, when speaking of the 'greatest,' just the one or two greatest in each section of thought and work. We could hardly put either Gladstone or Lincoln in such high position. Darwin and Mendelssohn must be high in their respective lists, but all proper

[*All Rights Reserved.*]

critics would dissent from their being established quite at the front. We could nearly, but not securely, rank Tennyson as one of the two or three men who have sung most sweetly or with finest poetic and moral effect in the language of the English people. It would indeed be impossible, we may imagine, for there to be such a concentration in one year of the birth of supreme genius. It would have been calamitous, disastrous, if the greatest of all ages had been contemporaries, and it was impossible for the reason that it is the age and the circumstances that develop the genius. We may doubt whether Milton or Shakespeare would have done very much for himself or the people if he had been born at the same time as Mr Swinburne and Mr Pinero. If Napoleon had been born in 1850 he would quite likely by this time have become either a newspaper proprietor, a railway magnate, or the managing director of a big firm of stockbrokers. How impossible would Cromwell have been in the nineteenth and twentieth centuries! Yet these are certainly among the greatest of the dead. Now, while we had none of these born in the year 1809, there was a most remarkable host of others who were only a little below them—just that little which is only achieved by one or two men in a thousand years. In 1809, so far as our present judgment is good, there were born more men who collectively rose to a higher standard of genius and fame than there were in any other year. We have to include the qualification about our present judgment, because it is clear that now, a hundred years after the births and anything from a dozen to fifty after the deaths of these personages, we are not by any means settled in mind about them. See how in recent years opinion has fluctuated about the merits of Tennyson and of Poe, and how irreconcilable are the various estimates of the value of the statesmanship of Gladstone when some of the conditions and problems with which he dealt are still with us. But that these people were really great, and that 1809 was a most marvellous year for the production of men, a year which we are bound to celebrate now, there can be no doubt at all. Earliest among the notable births in that year was that of Edgar Allan Poe (January 19); then there was Mendelssohn (February 3), there were Charles Darwin (February 12) and the future President Lincoln on the very same day. As this bountiful year progressed there came Edward Fitzgerald, Bishop Selwyn, Skene the Scottish historian, Lord Houghton, Mary the wife of Charles Cowden Clarke, John Stuart Blackie, Kinglake, and Tennyson within a few hours of each other as by another burst of Nature's enthusiasm; another eminent Scottish historian in John Hill Burton, Oliver Wendell Holmes, Fanny Kemble, Mark Lemon; and then, as a finishing-touch applied within a couple of days of the expiration of the year, there was not the least of this group of immortals, for all the differences of opinion about him, Gladstone, certainly one of the sincerest and most Christian-like of the great British statesmen. As if it had not honours enough, some have been giving to 1809 distinctions that it does not possess. For example, they have said that the composer Chopin belonged to it, and he has been commemorated accordingly. But Chopin was not really born until 1810, although it is true that the date on his tombstone is 1809. In the same way there are some others who have gone wrong about Elizabeth Barrett Browning, believing her to have been born on the 6th of March in 1809. Instead of that, she was most certainly born three years earlier. We have been told that the reason for the mistake in this case was that Mrs Browning, being some years older than her husband, was disposed to be somewhat sensitive upon the point, while at the same time her husband accommodated her by his diplomacy. People came to believe that she was born in 1809, but she was not.

* * *

However, the *annus mirabilis* was, as we have seen, so rich that such lights as these may be dropped without their being even missed by those who had fancied they belonged to it. The question as to which persons of this group are of greatest interest and whose lives added most to the sum of human happiness and contentment (not merely the happiness and contentment of their own contemporaries, but of posterity, for no man is great who does not continue his work after death) is one that will be settled variously according to the nationality, the circumstances, and the tastes and prejudices of each critic. It is possible that in the long-run there will be less disagreement about Tennyson than any other, and a more general appreciation of his work and the value of it. It is noticed even since he died that there has been a certain ebbing and flowing of the wave of his popularity, or, one should rather say, public estimation of him; but it becomes clear that this sweetest singer of the Victorian time will settle down in one of the highest places in British poetical literature. He fulfilled all the best qualifications of a true national poet, and it has been well said that not only his work but his life was of inestimable value to the whole of the English-speaking world. He lived during a period when a rapid and complete change in life and manners was brought about. It was the age when machinery was being set to run the world, and when England was going forward in her industrial development with an enormous energy. At such a time there was a great need for the lofty thinker, the noble spirit, who was deeply respected by the multitude, and who was inspired to point out in beautiful phrases the true values of the different parts of life. The tendency of his career was to raise the standard of thought and taste, to make men consider the nobler things more and the common ones less, and all the words that he sang were illustrated in his own life. If Tennyson was thus good to his age, he may be to some extent a steadying influence for a long time, and it is

certain that great poets who can arrest the attention of the people and bid them leave their luxury for a while to think of the meaning of all that is sweet and beautiful and noble in life were never more necessary than at the present time. A Tennyson would be an invaluable acquisition to the motor-age.

* * *

It is when pursuing this line of reflection that we come more firmly to the conclusion that Tennyson was the greatest of all these. Mendelssohn pleases us still; in fact, it is perhaps just to say that he pleases more people to-day than ever he did—those people, we mean, whose time for music is not given up to the most ephemeral compositions. His music was of that class that appeals to the taste of these times. He who first came forth with the *Midsummer Night's Dream* overture when he was only seventeen years old made music in all his too short life that wooed to happiness and contentment. It played lightly upon the fancies but did not strike at the emotions and cause the heart to swell. He would have nothing of gloom and seriousness; he was not noble like Beethoven; with him music was to be the simplest pleasure and solace, and so we come to regard him as the exact antithesis of that deeply mournful musician, Tschaikowsky. To each the nature of his achievement was inevitable. You have but to glance at a portrait of the open, sunny countenance of Mendelssohn-Bartholdy to know that there could be no sadness in the music that he created, while the genius who would attempt suicide by standing chin-high in the river at a time when it was freezing might well be expected to thunder tragedy and an impending general doom through his compositions. Mendelssohn pleases immensely, almost more than any, and to do that is to be vastly great; but he rarely inspires, stimulates, or causes to wonder, and so he is less than some others. Charles Darwin will always certainly be numbered among the greatest of his time. He was a determined and fearless seeker after truth, and his reasonings and resolutions have been fiercely discussed through different generations of thought until human belief has in some important essentials come to be reconstructed. The difficulty about assigning marks of full greatness to Darwin is on the point as to how far we must consider him the real and independent genius, and how far the mere necessary and inevitable product of a time. By the middle of last century education and reason had arrived at the point when a Darwin was certain to arise and write some such books as he did. They might not have been such sound books, the research-work would not have been so thorough, the reasoning so careful and exact; but others would have remedied defects, and a company and time would certainly have done what Darwin did alone and within a limited period. We may be all the more certain that this view is correct when we recall that by his anonymously published *Vestiges of the Natural History of Creation* in 1844, Robert Chambers actually anticipated both Darwin's theories and his methods of research.

* * *

At a time when one of the greatest Americans has just passed from a period of most strenuous activity to rest and retirement, we are brought to consider that this is the centenary also of a man who must always be reckoned as one of the finest and noblest and most clearly outstanding figures in the history of the great American nation. Now, it is by no means clear that if Abraham Lincoln had not lived, or had not risen from being the hand on his father's farm to being President of the United States, American or European history would have proceeded at all on the lines that it did, lines that were the best for all peoples in the end. It was his election to the presidency, with his previous strong anti-slavery pronouncements, that provoked the Civil War, and it was his clear conception, forceful energy, determination, and genius that brought North America safely through that terrible period, during which he stood out as the embodiment of the best spirit of the nation. There has scarcely ever been a greater oration uttered than his inaugural address on his second election to the presidency. This was a life of true greatness, where genius by its own innate force arose from almost nothing. We have the sharp contrast in the life of Gladstone. Any comparison in their respective greatnesses, such as some people might be disposed to attempt, must be futile. In mere achievement, definite and practical, Lincoln, of course, was incomparably the superior; but there was a great nobility about Mr Gladstone's life, a sweetness and a purity the beneficial effect of which upon the English people has, we imagine, been well continued since his death. He was more of the great Christian than the great statesman, and perhaps some of the failings of his career were due to his not being able to blend perfectly these two inner Gladstones. But he left a rich legacy of example of honesty of purpose and simplicity of life and conduct to the nation. Gladstone snatched at ideals when Lincoln performed sound practical and magnificent work, but in a certain measure each had similar objects in view.

* * *

It is a little curious to think how these two men who between them rose to lead for a time the entire English-speaking race moved upwards and onwards from such widely separated starting-points. Until he was nineteen Lincoln was on his father's farm in Ohio, and for long after that he was a clerk, a storekeeper, a postmaster, and so forth. And there was Gladstone, not indeed born among vast riches or luxury, but to a quite sufficient wealth and surrounded by culture. He had every possible advantage for intellectual improvement and achievement, and at the outset of his political career he had influence enough on his side to further his interests and ambitions to the fullest extent. The

man himself was worth it all; but the circumstances are as said. So in 1809 you had these two beings come into the world and begin to move forward until they stood above almost all men, leading and directing mankind—the one beginning to advance from the little farm in Ohio, and the other from a rich home in Liverpool. Little did the grown men of 1809 or of 1829 know to what that wonderful year had given birth. Perhaps the only musician of that group of genius was the first to give the sign. But in 1859 people were still unaware that Nature had laboured to such wonderful purpose half a century before. It is only now, in the complete cycle of a hundred years, that we have full knowledge and almost adequate appreciation. In that reflection there may be some encouragement to think better of the present time than may be one's habit. If we seem to see so little genius about us, let it be remembered that the proverb that the prophet hath not honour among his own people applies to time as well as to place, and also that there may be men in the making now whose greatness will not be accomplished for many years. The difficulty is that life is so complex, so crowded, so bustling, and so materialistic that genius does not have the same opportunities as formerly. Would a new Tennyson, specially adapted to the time, be of such force and estimation in this century as the dead one was in his? Is the strongest individualism any more possible? It may be; but genius has a greater struggle against indifference now than it had in the nineteenth century.

THE HOUSE OF WHISPERS.

CHAPTER XXII.—BY THE MEDITERRANEAN.

IT was February—not the foggy, muddy February of dear, damp Old England, but winter beside the bright-blue Mediterranean, the winter of the Côte d'Azur.

At the Villa Heyburn—that big, square white house with the green sun-shutters, surrounded by its great garden full of spreading palms, sweet-smelling mimosa, orange-trees laden with golden fruit, and bright geraniums, up on the Berigo at San Remo—Lady Heyburn had that afternoon given a big luncheon-party. The smartest people wintering in that most sheltered nook of the Italian Riviera had eaten and gossiped and flirted, and gone back to their villas and hotels. Dull persons found no place in Lady Heyburn's circle. Most of the people were those she knew in London or in Paris, including a sprinkling of cosmopolitans, a Russian prince notorious for his losses over at the new *cercle* at Cannes, a divorced Austrian Archduchess, and two or three well-known diplomats.

'Dear old Henry' remained, of course, at Glencardine, as he always did. Lady Heyburn looked upon her winter visit to that beautiful villa overlooking the calm sapphire sea as her annual emancipation. Henry was a dear old fellow, she openly confided to her friends, but his affliction made him terribly trying.

But Jimmy Flockart, the good-looking, amusing, well-dressed idler, was living down at the 'Savoy,' and was daily in her company, driving, motoring, picnicking, making excursions in the mountains, or taking trips over to 'Monte' by the *train-de-luxe*. He had left the villa early in the afternoon, returned to his hotel, changed his smart flannels for a tweed suit, and, taking a stout stick, had set off alone for his daily constitutional along the searoad in the direction of that pretty but half-deserted little watering-place, Ospedaletti.

Straight before him, into the unruffled, tideless sea, the sun was sinking in all its blood-red glory as he went at swinging pace along the white, dusty road, past the *octroi* barrier, and out into the country where, on the left, the waves lazily lapped the gray rocks, while upon the right the fertile slopes were covered with carnations and violets growing for the markets of Paris and London. In the air was a delightful perfume, the freshness of the sea in combination with the sweetness of the flowers.

A big red motor-car dashed suddenly round a corner, raising a cloud of dust. An American party were on their way from Genoa to the frontier along the Corniche, one of the most picturesque routes in all the world.

James Flockart had no eyes for beauty. He was too occupied by certain grave apprehensions. That morning he had walked in the garden with Lady Heyburn, and had a long chat with her. Her attitude had been peculiar. He could not make her out. She had begged him to promise to leave San Remo, and when asked to tell the reason of this sudden demand she had firmly refused.

'You must leave here, Jimmy,' she had said quite calmly. 'Go down to Rome, to Palermo, to Ragusa, or somewhere where you can put in a month or so in comfort. The Villa Igiea at Palermo would suit you quite well—lots of smart people, and very decent cooking.'

'Well,' he laughed, 'as far as hotels go, nothing could be worse than this place. I'd never put my nose into this hole if it were not for the fact that you come here. There isn't a hotel worth the name. When one goes to Monte, or Cannes, or even decaying Nice, one can get decent cooking. But here—ugh!' and he shrugged his shoulders. 'Prices higher than the "Ritz" in Paris, food fourth-rate, rooms cheaply decorated, and a dullness unequalled.'

'My dear Jimmy,' laughed her ladyship, 'you're such a cosmopolitan that you're incorrigible. I

know you don't like this place. You've been here six weeks, so go.'

'You've had a letter from the old man, eh?'

'Yes, I have,' she replied, and he saw that her countenance changed; but she would say nothing more. She had decided that he must leave San Remo, and would hear no argument to the contrary.

The southern sun sank slowly into the sea, now gray but waveless. On the horizon lay the long smoke-trail of a passing steamer eastward bound. He had rounded the steep, rocky headland, and in the hollow before him nestled the little village of Ospedaletti, with its closed casino, its rows of small villas, and its palm-lined *passeggiata*.

A hundred yards farther on he saw the figure of a rather shabby, middle-aged man, in a faded gray overcoat and gray soft felt-hat of the mode usual on the Riviera, but discoloured by long wear, leaning upon the low sea-wall and smoking a cigarette. No other person was in the vicinity, and it was quickly evident from the manner in which the wayfarer recognised him and came forward to meet him with outstretched hand that they had met by appointment. Short of stature as he was, with fair hair, colourless eyes, and a fair moustache, his slouching appearance was that of one who had seen better days, even though there still remained about him a vestige of dandyism. The close observer would, however, detect that his clothes, shabby though they were, were of foreign cut, and that his greeting was of that demonstrative character that betrayed his foreign birth.

'Well, my dear Krail,' exclaimed Flockart after they had shaken hands and stood together leaning upon the sea-wall, 'you got my wire in Huntingdon? I was uncertain whether you were at the "George" or at the "Fountain," so I sent a message to both.'

'I was at the "George," and left an hour after receipt of your wire.'

'Well, tell me what has happened. How are things up at Glencardine?'

'Goslin is with the old fellow. He has taken the girl's place as his confidential secretary,' was the shabby man's reply, speaking with a foreign accent. 'Walter Murie was at home for Christmas, but went to Cairo.'

'And how are matters in Paris?'

'They are working hard, but it's an uphill pull. The old man is a crafty old bird. Those papers you got from the safe had been cunningly prepared for anybody who sought to obtain information. The consequence is that we've shown our hand, and heavily handicapped ourselves thereby.'

'You told me all that when you were down here a month ago,' Flockart said impatiently.

'You didn't believe me then. You do now, I suppose?'

'I've never denied it,' Flockart declared, offering the stranger a Russian cigarette from his gold case. 'I was completely misled, and by the girl also.'

'The girl's influence with her father is happily quite at an end,' remarked the shabby man. 'I saw her last week in Woodnewton. The change from Glencardine to an eight-roomed cottage in a village street must be rather severe.'

'Only what she deserves,' snapped Flockart. 'She defied us.'

'Granted. But I cannot help thinking that we haven't played a very fair game,' said the man. 'Remember, she's only a girl.'

'But dangerous to us and to our plans, my dear Krail. She knows a lot.'

'Because—well, forgive me for saying so, my dear Flockart—because you've been a fool, and have allowed her to know.'

'It wasn't I; it was the woman.'

'Lady Heyburn! Why, I always believed her to be the soul of discretion.'

'She's been too defiant of consequences. A dozen times I've warned her; but she will not heed.'

'Then she'll land herself in a deep hole if she isn't careful,' replied the foreigner, speaking very fair English. 'Does she know I'm here?'

'Of course not. If we're to play the game she must know nothing. She's already inclined to throw prudence to the winds, and to confess all to her husband.'

'Confess!' gasped the stranger, paling beneath his rather sallow skin. '*Per Bacco!* she's not going to be such an idiot, surely?'

'We were run so close, and so narrowly escaped discovery after I got at those papers at Glencardine, that she seems to have lost heart,' Flockart remarked.

'But if she acted the fool and told Sir Henry, it would mean ruin for us, and that would also mean'——

'It would mean exposure for Gabrielle,' interrupted Flockart. 'The old man dare not lift his voice for his daughter's sake.'

'Ah,' exclaimed Krail, 'that's just where you've acted injudiciously! You've set him against her; therefore he wouldn't spare her.'

'It was imperative. I couldn't afford to be found prying into the old man's papers, could I? I got impressions of his key while walking in the park one day. He's never suspected it.'

'Of course not. He believes in you,' laughed his friend, 'as one of the few upright men who are his friends! But,' he added, 'you've done wrong, my dear fellow, to trust a woman with a secret. Depend upon it, her ladyship will let you down.'

'Well, if she does,' remarked Flockart, with a shrug of the shoulders, 'she'll have to suffer with me. You know where we should all find ourselves.'

The man pulled a wry face and puffed at his cigarette in silence.

'What does the girl do?' asked Flockart a few moments later.

'Well, she seems to have a pretty dull time with the old lady. I stayed at the "Cardigan Arms" at Woodnewton for two days—a miserable little place—and watched her pretty closely. She's out a good deal, rambling alone across the country

with a collie belonging to a neighbouring farmer. She 's the very picture of sadness, poor little girl !'

'You seem to sympathise with her, Krail. Why, does she not stand between us and fortune ?'

'She 'll stand between us and a court of assize if that woman acts the fool !' declared the shabby stranger, who moved so rapidly and whose vigilance seemed unequalled.

'If we go, she shall go also,' Flockart declared in a threatening voice.

'But you must prevent such a *contretemps*,' Krail urged.

'Ah, it 's all very well to talk like that ! But you know enough of her ladyship to be aware that she acts on her own initiative.'

'That shows that she 's no fool,' remarked the foreigner quickly. 'You who hold her in the hollow of your hand must prevent her from opening up to her husband. The whole future lies with you.'

'And what is the future without money ? We want a few thousands for immediate necessities, both of us. The woman's allowance from her husband is nowadays a mere bagatelle.'

'Because he probably knows that some of her money has gone into your pockets, my dear boy.'

'No ; he 's completely in ignorance of that. How, indeed, could he know ? She takes very good care there 's no possibility of his finding out.'

'Well,' remarked the stranger, 'that 's what I fear has happened, or may one day happen. The fact is, *caro mio*, we are in a quandary at the present moment. You were a bit too confident in dealing with those documents you found at Glencardine. You should have taken her ladyship into your confidence and got her to pump her husband concerning them. If you had, we shouldn't have made the mess of it that we have done.'

'I must admit, Krail, that what you say is true,' declared the well-dressed man. 'You are such a philosopher always ! I asked you to come here in secret to explain the exact position.'

'It is one of peril. We are checkmated. Goslin holds the whole business in his hands, and will keep it.'

'He doesn't suspect us ?'

'Very fortunately for you he doesn't, though we were very near exposure when I went out to Athens and made a fool of myself upon the report furnished by you.'

'I believed it to be a genuine one. I had no idea that the old man was so crafty.'

'Exactly. And if he displayed such clever ingenuity and forethought in laying a trap for the inquisitive, is it not more than likely that there may be other traps baited with equal craft and cunning ?'

'Then how are we to make the *coup* ?' Flockart asked, looking into the colourless eyes of his friend.

'We shall, I fear, never make it, unless '——

'Unless what ?' he asked.

'Unless the old man meets with an accident, replied the other in a low, distinct voice. '*Blind men sometimes do, you know !*'

(*To be continued.*)

CASTAWAYS: ANCIENT AND MODERN.

By WILLIAM ALLINGHAM, Author of *Marine Meteorology*, &c.

NAVIGATION first became an accomplished fact upon the classic waters of the Mediterranean Sea ; and perhaps the initial successes are more rightly attributed to accident than to design. Homer has left a vivid word-picture of the ancient mariners who ever hailed with gladness the rosy-fingered dawn. By day their frail craft coasted from point to point, by night the stars sometimes served as guides ; but these toilers of the narrow waters did not willingly lose sight of the land. Occasionally, however, they were driven seaward by the combined forces of Æolus and Neptune, and had precedence in emigration forced upon them. Exultant, the Heroes set sail from the reduction of Troy in order to regain their motherland ; but a savage storm scattered the Grecian fleets far and wide. Ulysses, bravest of the brave, wandered a castaway for a decade, with his faithful few. Æneas, son of Anchises and Venus, is another of the old-time castaways made famous by the poets. Accepting Virgil's verse for this occasion, it follows that Æneas reached the coast of Libya, where the subsequently unhappy Dido reigned. She received the weary wanderer to her own undoing ; and there he remained until the strain of his nostalgia proved more powerful than the admitted charms of the despairing queen. Even in historic times we find St Paul, together with three hundred exiles crowded in a crazy craft, being driven out of his course and left a castaway on either Malta or on an island in the Adriatic.

The virile Vikings, while essaying the task of navigating the indented and rocky coast of Norway, were not infrequently compelled to leave the land and run before the gale far to the westward on an unknown sea which had been erroneously assumed to teem with monstrous shapes. Iceland happened to be right on the track followed by some of these dauntless sea-rovers ; and there, like Æneas and his followers in a far fairer land, they sought the green meadows to rest their weary limbs. Westward the star of empire was fortuitously wending its way ! The pioneers returned home with the first fair wind ; and shortly afterwards Iceland was colonised by the one-time castaways and their kindred. As they wanted a compass by which to steer, and were

frequently beset by thick weather, there is little cause for surprise that only a portion of these Norse emigrants managed to reach so hazardous an objective. Many found a resting-place at the bottom of the sea; some kept afloat their clumsy, lighter-like vessels, and eventually found themselves in sight of what is now known as Greenland. Here, again, the castaways made the best of an appalling situation, annexed the inhospitable coasts, and succeeded in opening up communication with their motherland. Later on the Norsemen coasted southward; and a few of them are asserted to have attained to a position somewhere between where Boston and New York stand to-day. These immigrants and their descendants appear to have been in touch with Norway for some three hundred years; but the American continent became legendary about the seventh century, and remained so till the days of Christopher Columbus.

In 1886 the *Columbine*, a small sailing-vessel, drifted from Shetland to Norway with only an infirm woman on board. This tiny craft stranded near Lerwick. The crew sought safety, forgetful of the passenger; the vessel floated off the bank with the rising tide, and the old lady awoke to the fact that she was a castaway. An easterly gale first drove the vessel towards Iceland, thus repeating in a measure the experience of the Norse adventurers; then a change of wind to the opposite point of the compass occurred, and after many leaden-footed hours the forsaken one reached a haven where daring men were eager to effect a rescue. The *Columbine*, running before a westerly gale, had threaded the intricacies of Vigerö Fjord (Norway) without mishap, although the tortuous channel was not lightly approached at any time by the skilful seamen of that coast. Half-frozen and almost famished, the castaway was brought ashore by fisherfolk at great personal risk; she was carefully tended by her warm-hearted rescuers, and then sent back to her native land none the worse for her devious drift over many a weary league of sea.

Islets in the Pacific Ocean abound between the tropics of Cancer and of Capricorn; hence it is probable that a large number of these pretty pinnacles of coral were peopled by castaways from neighbouring islands, driven thither in open boats. Kotzebue, the renowned Russian nautical explorer, picked up some natives of the Caroline Islands, in a canoe, who were two hundred miles to leeward of their homes, and quite unable to locate the island again. Captain Beechey, R.N., fell in with a canoe containing tired Tahitians not less than six hundred miles from Tahiti. They were in utter ignorance of their position on the waste of waters, but were prepared to meet death with dry eyes. In both instances the castaways had been compelled seaward by a careering cyclone. It was in the South Pacific, on the island of Juan Fernandez, that the Scotsman named Alexander Selkirk had the varied experience which may have served Defoe as the firm foundation on which to build his inimitable description of that world-famed castaway, who will be known for all time as Robinson Crusoe. The Pacific was also the stage on which was acted to a finish the ever-memorable mutiny of the *Bounty*. Bligh, her commander, with black care sitting close behind him all the way, reached Timor, with his fellow-castaways, after a passage of twelve hundred leagues in an open boat. The castaway John Adams, the sole survivor of the mutineers who made a home on Pitcairn Island with their native concubines and half-breed children, remained cut off from civilisation and utterly lost to the world for nearly a quarter of a century.

The most recent additions to the list of castaways, as might rightly be expected, are also connected with the remote islets of the Pacific Ocean. In February 1907 the large, four-masted sailing-ship *Dundonald* left Australia for England with a cargo of golden grain; nothing more was heard of her, and in the usual course of events she was posted at Lloyd's as a missing ship. The underwriters on hull and cargo paid as for a total loss; the friends and relatives of the crew mourned their loved ones as among old ocean's dead; and the *Dundonald* bade fair to be numbered with many another mystery of the deep. Early in December, however, news arrived from New Zealand by cable that fifteen survivors of the crew of this vessel had been rescued from one of the Auckland Islands and landed at New Zealand by a scientific expedition which chanced upon them. The *Dundonald* was wrecked on Disappointment Island, of the Auckland Group, just a month after sailing for home. Captain Thorburn, his son, and ten men were drowned; the mate died from exposure soon after reaching dry land; and the remainder eked out a miserable existence by the aid of birds, seals, and roots during five months. Then they made a canvas coracle, and a party visited adjacent islets in the hope of locating a provision depôt which was known to have been placed on one of them by the Government. After nine days the quest was abandoned in despair, and the return passage made to their expectant shipmates. In September a second search was made, success crowned their efforts, and the whole of the castaways migrated to the provisioned base of operations in a boat which had been thoughtfully left on the island long ago in anticipation of some such emergency. Experiences of this nature, however, are rather frequent in the Pacific.

The Norwegian barque *Alexandra* was abandoned not far from the Galapagos Islands in May while on her way from Australia to Panamá with a cargo of coal. She had made a protracted passage of one hundred and sixty-five days, calms were persistent, food and water were scarce, and the cosmopolitan crew were on the verge of mutiny. Officers and crew left the devoted barque in two boats—one in charge of the captain, the other controlled by the mate. During two days the boats kept in sight, then separated, and each considered the other as among the missing. For seven days the men in the mate's boat persevered with the oars, although under

a vertical sun, with the sea and the wind comparable only to those of Coleridge's 'Ancient Mariner;' then Charles Island was reached, and safety seemed assured. The castaways stopped there three days, hoping that the captain's boat might yet arrive, but were compelled to set out for the Chatham Islands in order to obtain provisions and water, of which Charles Island was destitute. The intervening sixty miles were safely covered, and the authorities of the convicts' settlement on Chatham Island did their best to alleviate the lot of the castaways. Spanish was the language spoken on the island; but among the two hundred and fifty convicts were two Jamaica negroes, and they acted as interpreters. Nine days were spent on this island, during which the mate and his men got into order a dismantled sloop given by the authorities; then they set sail, and after eleven days reached the mainland near Guayaquil. Later on the abandoned *Alexandra* drifted ashore on one of the Galapagos Islands; but the fate of the captain's boat remained obscure until six months had elapsed. In November, however, the wife of Donald Morrison, one of the missing men, who belonged to Dundee, received a telegram that her husband had been saved and was then at Guayaquil. During the whole of this period the castaways had been looking for a friendly sail from the lonely islet of the Pacific which had served as their home till rescue came.

The French sailing-ship *Anjou*, making the same passage as the *Dundonald*, went ashore on a reef of the Auckland Islands in February 1905. On reaching the land, the shipwrecked crew found shelter-huts which had been erected by the New Zealand Government, and which contained both food and shoes. Albatross were caught and eaten in a half-raw state; some were allowed to depart bearing a message scratched on a piece of tin, setting forth the facts of the case, and it was hoped these aerial mail-carriers would reach either ship or shore to ensure a rescue. Just four months after landing on the island the castaways were taken off by the New Zealand Government steamer *Hinemoa*, which had been engaged for a score of years in revictualling the shelters on the various islands near New Zealand.

At a more remote date the barque *Wandering Minstrel* stranded on Midway Island (since pressed into the submarine telegraph cable service), and all hands awaited the assistance which never came. Tired of so dismal an outlook, the mate and two men attempted to gain the Sandwich Islands in a small boat; and the trio disappeared without leaving a trace. Eight more months passed away down the avenues of time, hope of succour had almost become a minus quantity, and then a passing schooner observed the signals of distress improvised on the lonely island. This unknown vessel forthwith sent a boat to the landing-place, took off the fourteen months' castaways, and landed them at Honolulu. Five men died during the wearisome wait; but the captain's wife and four young children withstood this ordeal by exposure.

The American barque *Tewkesbury L. Sweat* was wrecked on one of the Caroline Islands, and her crew remained there for more than seven months as honoured guests of the savages. Then they sailed away in boats and canoes, and were picked up by a passing ship after having made one thousand miles towards a place where a passage home was easily obtainable.

The British barque *Henry James* struck on a coral-reef near Palmyra Island, became a wreck, and her passengers and crew sought safety on this inhospitable island. Six ruined huts were standing, which had probably been built by previous castaways; and there were plenty of cocoa-nuts, eels, birds, eggs, land-crabs, and fresh-water to be got with a little ingenuity. Chief-Officer Macdonald, with four volunteer seamen, managed to reach Samoa in a small boat after nineteen days' terrible suffering spent in navigating the thirteen hundred miles between the two islands, and the American steamship *Mariposa* hastened to comply with the appeal for aid.

In 1891 the barque *Compadre* caught fire in mid-ocean, and she was beached at Auckland Island in order to save the lives of those on board. There the castaways were detained for over one hundred days, and then they were rescued.

In 1875, when eager hearts and willing hands were frequently carried to the Antipodes in stately sailing-ships, one of these vessels, the *Strathmore* of Dundee, was lost on an outlying reef of the Crozet Islands. Several lives were sacrificed, and the survivors perforce emulated the doings of Robinson Crusoe on a desolate island for nearly seven months, living on penguins and eggs. For six months not a sail was sighted. Then the inclement weather having given way to a more favourable position of the sun in the ecliptic, in January—which is the southern midsummer month—a vessel passed the island without observing the castaways. A week later, however, the American whaling-vessel *Young Phœnix* arrived off the island, rescued the forty-nine survivors, and brought them to a safe haven.

In December 1906 the Norwegian sealing-schooner *Cathrine* was driven ashore by a gale on one of the Crozet Group. Her crew waited patiently for a month, in the hope that some ship might pass close to the island and effect a rescue; and then Captain Rae left with two sailors, in an open boat, determined to reach Melbourne or perish in the attempt. Meanwhile the castaways had discovered the depôt of provisions left at this remote spot by the Government in 1880, and there was an abundance of fresh-water, seals, and penguins. After having sailed one thousand miles on their errand of mercy, the dauntless trio were picked up by the German ship *De Ruyter* on her way from Japan to the United States, were transferred to a tug-boat not far from Melbourne, and were soon in touch with the shore authorities. The Federal Premier immediately cabled to the Cape Government; and, in response thereto, the steamship *Turakina* was ordered to call at the island. She found the eleven

castaways in good health, brought them on to Hobart, and the Norwegian Consul provided the necessary clothing and other comforts for his countrymen. Mr H. J. Bull of Christiania, the owner of the *Cathrine*, wrote a letter of thanks to the British nation on behalf of himself and his fellow-castaways; His Majesty King Haakon VII. conferred the order of St Olav on Captain Forbes of the rescuing steamer; and the Norwegian Government has taken the opportunity of the departure of the steamship *Solglimt*, on a similar expedition, to replace the provisions which were used from the depôt at Crozet Islands by the crew of the *Cathrine*.

In October 1845 the French barque *Atalanta* sighted a raft, in 15 degrees S., 54 degrees E., on which were two Lascar seamen and also a corpse. A boat was lowered and the survivors brought on board. One of them handed to the French captain the leaf of a book on which a letter was written in English. Ignorant of the English language, he took the communication to Calcutta, where it was found to be a message from the chief-officer and second-officer of the British barque *Letitia*, asking for assistance, as their vessel was a wreck on an island to the north-east of Mauritius. The Government vessel *Tenasserim* was despatched to the scene of the wreck, and found that the crew had been taken off by a passing ship. Twelve Lascars left the island on the above-mentioned raft in order to intercept a sailing-vessel observed on the horizon; they failed to reach her, and all but two died from starvation, thirst, and exposure.

In 1889 eleven of the crew of the wrecked barque *Glenhuntly* were castaways on Tristan d'Acunha for five months. They were eventually taken thence to Capetown by H.M.S. *Thrush*.

The sailing-ship *Holt Hill* was wrecked on St Paul's Island. Neither provisions nor water could be saved, and the castaways, numbering thirty-one, existed for some time on penguins, lobsters, and shellfish. Just when hope was waning in their breasts a barque hove in sight; she observed the signals of distress, sent a boat ashore, and the rescued crew were safely landed at Port Adelaide.

Consequent on shipwrecks, and the ensuing sufferings of the castaways, there has been a considerable number of depôts containing food and clothing established not only on the uninhabited islands of the lone Southern Ocean, between the meridians of the Cape of Good Hope and New Zealand, but also on other dangerous spots scattered over the seven seas. Huts and caverns are similarly provided for shelter; and every effort is made internationally to bring before seamen the exact positions of these refuges for castaways, both by special printed notices handed to shipmasters just prior to their proceeding on a voyage and by directions which greet the wanderers on landing at the selected places within a short distance of which the depôts will be found. A detailed list of all the depôts is given regularly in the *Notices to Mariners* issued by the Board of Trade to foreign-going ships, and also in *Lloyd's Calendar*. On Skeidara Sands, on the south coast of Iceland, there is a refuge for castaways on a conspicuous hill. It contains provisions, means of attracting the attention of passing vessels, and directions in five different languages which guide the shipwrecked mariners to the nearest habitation. On the islands of Amsterdam, St Paul, and Kerguelen, in the Indian Ocean, are similar depôts. At Amsterdam Island a cavern is utilised, at St Paul Island there is a hut of rough stones, and at Kerguelen a cave serves every purpose. At the entrance to each is a notice which reads as follows: '*Vivres et Vêtements pour Naufragés. Eure, Janvier* 1893.' In the first depôt are supplies of preserved beef, biscuits, woollen shirts, cotton drawers, blankets, and matches in a metal hermetically sealed box. There are also cots, a cooking-pot, and dry wood; cabbages and celery grow quite near; and fish abound close to the landing-place. H.M.S. *Comus* in 1880 arranged a provision depôt, consisting of huts, at Possession Island, Crozet Group, and left therein sufficient food for fifty people to last fifty days, together with jerseys, trousers, stockings, and shoes. Seven years later the French war-vessel *La Meurthe*, recently lost, founded a like depôt at Hog Island of the same group. In a hut there were deposited preserved beef, biscuits, sardines in oil, blankets, shoes, cloth trousers, cooking utensils, two spears, and two hatchets. Both the food and the articles are most carefully packed, so as to withstand the ravages of time and exposure; and the articles left by H.M.S. *Comus* were intact when the depôt was visited by the French warship in 1887. There are depôts for castaways on several of the islands nearer to New Zealand, among them being the Kermadec, Snares, Bounty, Antipodes, Auckland, and Campbell Islands. A Government steamer visits Kermadec Islands once a year, and the other depôts twice a year, in order to rescue any castaways and replace with sound stores such of the old stock as may be deemed unfit for use. At some of these places boats are kept in repair and in an easily available position for the use of shipwrecked persons in their hour of need. On the Auckland Islands are three depôts, and lifeboats awaiting demand at about half-a-dozen places. Finger-posts to indicate the positions of the depôts are erected on all the above-mentioned islands. There is also a shipwrecked mariners' refuge at the entrance to Magellan Strait; and there are depôts, with provisions and other necessaries, at Cape Beale Lighthouse and Carmanah Lighthouse, both on the coast of Vancouver Island.

Notice-boards have been erected at intervals for the purpose of supplying the castaways with information as to the best route to follow in order to gain the depôts or the nearest Indian village without delay. Gales of wind are not any respecters of persons, and occasionally the notice-boards are blown down, thus preventing the next lot of castaways from finding their way to the provisions and clothing not many yards from the place at which they landed. Sometimes, also, it is to be feared

that the stores are left so long at the depôts without attention as to deprive the castaways of the aid upon which they relied. Some few years ago the barque *Spirit of the Dawn* was wrecked on Antipodes Island, about six hundred miles south of New Zealand, and Captain Millington and four of his crew were drowned. For three months the survivors practically faced starvation within a short distance of the Government food and clothing depôt, which they were unable to locate because the finger-posts had been laid low by the very gale which cast them ashore. They were eventually taken off the island by the Government steamer when she paid her usual visit to overhaul and replenish the stores. Just why the crew of the *Dundonald* had a like bitter experience is not clear. Captain Rae, of the wrecked schooner *Cathrine*, reports that the old depôt for castaways on the Crozets had been blown down by gales and almost demolished, and the food, consisting of flour and tinned beef, was unfit for consumption. Captain A. Simpson, of the Aberdeen White Star Line, often steers close to these islands on his way to Australia in order to see if any castaways are visible, but, so far, without result. Had the crew of the *Alexandra* been aware that Albemarle Island, in the vicinity of which the two boats separated, was partially inhabited, they would have been saved much suffering and more anxiety. The settlement is somewhat inland, and on the opposite side of the island to that coasted by the boats; so it could not be discovered by strangers. Had they known of this place of refuge, however, a long wait would have been their lot, because the visit of a warship once a year is the only means of communication with the outer world.

THE AWAKENING OF JOHN HAVISHAM.

PART II.

In a vague, subconscious way, Havisham heard the two pairs of feet go down the stairs, and the sound of their going dwindle away until it merged into the other sounds that muttered and rumbled from the city's streets; but for a long, long time he stood quite still and silently studied the useless paintings. Then, of a sudden, he picked them up, laid them one on one, tore them down and across, and contemptuously flung them to the other end of the room.

'Ten hours' work!' he said with a ragged, unnatural sort of laugh; 'ten hours of ceaseless work on you, and yet you wouldn't give me the price of a penny bun, you miserable ingrates! No, you wouldn't even save me from this,' he added a moment later, when he turned to the table and found Steinmetz's sovereign lying there—a bit of golden Opulence in the lap of Squalor. 'I gave my heart, and soul, and brains, and body; I pinned my faith on you, painted my hopes into you, and in return you fling me back on *charity!* Oh God!' He flung out his arms with a passionate gesture of despair. 'What was it that made me great five years ago if I am such a hopeless bungler now?'

A moment of peevish irritability followed this sudden outburst. He made one or two excited turns up and down the room, then stopped at the table and looked fixedly at the shining sovereign; then of a sudden he swung away from it, took up his easel and broke it across his knee, snapped short the handles of his brushes and jammed them into his paint-box, shut down the lid, pushed it into his pocket, put on his hat, and, picking up the sovereign, opened the door and walked out of the room.

'We've lived together and we'll go out of it together, old pals,' he said, tapping the pocket in which the paint-box and the brushes lay. 'Our day's past, and we've outlived our usefulness, it seems; but our little golden friend will give us one good meal, one last night of plenty, and when he's done for we'll call on Father Thames.'

The short winter day was quite gone by this time, and the darkness of nightfall was shutting down over the city's streets. A fog had come on, and through it the laden 'buses slipped by like creaking ghosts, and the street-lamps blinked inadequately. The dense, sulphurous atmosphere made Havisham's eyes smart and the membranes of his throat and nose tingle and burn as though he were inhaling fire, and before he had gone fifty yards he switched round and altered his intention. He had meant to hail a cab and drive straight to one of the West End restaurants; but his vital forces were at so low an ebb that he could not face the journey in this fog until he had bolstered up his sapped strength with food. He turned, therefore, into Deptford High Street, and, singling out the best of the near-by restaurants, swung into it, made for a table near the fireplace, and amazed the waiter by ordering, 'Mutton chops—two of them, French fried potatoes, cauliflower, and some stewed celery, if you have it. After that a devilled kidney, a salad with tomatoes and olives, a sweet, a portion of gorgonzola, a pot of coffee, and a shilling cigar. Move lively. I'm in a hurry.'

But in spite of the final assertion—to which colour was given by the manner in which he 'wolfed' the first course—he sat for an hour and a half over his meal, gorging, basking in the heat of the fire, sipping his coffee, and smoking his cigar.

Deptford had one advantage over the West End: the bill, when he settled it and tipped the waiter, left him with the major part of his sovereign still in hand. Well, so much the better; his 'night' would last longer, and he could see a little more of

'life' before he pulled down the curtain and went out of it.

The food and the warmth had revived and fortified him, so that the fog no longer had the same terrors when he passed by the bowing waiter and stepped out into the street again.

Two glowing orange eyes glared at him out of the vapour, and a voice from above and behind them sang out, 'Keb, sir?' as he came out upon the pavement again and stood looking up and down the street and wondering whither he should go next.

'A cab! Yes, why not? A cab and a music-hall, and supper afterwards.' He 'd have his sovereign's worth of life and comfort and brightness—have all that was coming to him for this last night.

'Yes,' he said. 'I want to go to a show. What's on that 's worth seeing?'

'Rather good bill at the Odeon, sir, down "Elephant and Castle" way. Some wenderful Eyetalian acrobats, sir, and a bit of a ballet, and a funny man that 's a fair treat. Make you laugh fit to split your sides, sir.'

'All right, take me there,' said Havisham, and stepped into the cab.

The show had already begun when he reached the Odeon and paid his half-crown for a stall-seat; but although it wasn't by any means a first-class show, it was good of its kind, generous in its quantity, clean as regards its moral aspect; and the house was warm, the audience respectable, and he could smoke to his heart's content.

He found the Italian acrobats distinctly clever, but the funny man a decided bore. Well, no matter; others were laughing; the house was warm; he had eaten and was comfortable; it was a half-crown well spent if—if——

His thoughts trailed off and lost themselves in a pleasant sort of blur; the jokes of the funny man and the laughter of the audience came to him dimly—with a far-away sound, as though he had somehow detached himself from them, and was losing without missing them; then came a soft, close-pressing darkness, and all the rest was blank.

A gentle shake, the steady, insistent pushing of a firm hand, and the sound of a voice saying, 'Mind sitting up a bit, sir? You 're a tidy weight, and my shoulder 's a-gettin' stiff.' This was Havisham's next lucid recollection. He started up, his thoughts in a whirl, his eyes blinking, conscious now that he had dropped off to sleep, and, straightening himself up in his seat, fumbled about with his programme.

'Number eight it is, sir—Miss Muriel Devere, Balladist,' said the same kindly voice at his elbow; and at the same moment Havisham became aware that the orchestra was playing a familiar strain, and a woman was singing indifferently, 'Oh that we two were Maying!'

He lifted his head and looked towards the stage; he saw a face and a figure that made his heart surge up and choke him, the blood drum at his temples, and the colour flash out of his lips and cheeks. He started up before he was conscious of doing so, and over the narrow space between the stalls and the stage his eyes and the woman's eyes met.

He sat down again suddenly, conscious that she had seen and had recognised him—conscious that, poorly as she had been acquitting herself before, she was doing worse now, for there was a continuous *tremolo* in her notes and she was singing off the key. She never looked in his direction again—she seemed afraid to trust herself. But Havisham's eyes never altered their fixed gaze; and when she finished and bowed herself off the stage as composedly as she could he was still staring at her, and his hands were shaking as though he had lost control of them.

'Don't think much of *her*. My missis can sing all round her any day,' commented a man's voice behind him, and Havisham was seized with a sudden desire to hit him.

For the fraction of a minute he wavered uncertainly, remembering Steinmetz, remembering to what end the sovereign had been dedicated; then he got up suddenly, crushed his way up the aisle and through the gates, stopping a moment to ask a question of the ticket-taker, then forged out into the foggy street and went round to the stage-door.

She was there, waiting for him, wrapped in a shabby old cloak that covered her to the hem of her skirt, the frilled hood of it pulled over her head, and an old leather satchel in her hands.

'Nell! my dear, my dear!' he said, and then stood quiet and ashamed.

'I knew you 'd come, Jack,' she said, with something that was half a laugh and half a sob in her voice. 'I was so sure of it that I didn't even take time to change my slippers, dear. Oh Jacky! oh Jacky! I've wanted it so much, dear—so much, so long, so earnestly!'

For Havisham had looked into her eyes and seen something that drove all other thoughts away, and had taken her in his arms and kissed and kissed and kissed her.

'I've got something I want to tell you—something I ought to have told you long ago,' she said from the safe shelter of his arms. 'But I can't tell it now, I can't tell it here. I mustn't miss my 'bus, or I shall be late for my "turn" at the Imperial. I 'm singing at two houses a night this week.'

A cab was at the corner. Havisham—glad now that he hadn't gone to the West End and thrown the entire sovereign away—whistled it up, and, lifting her in his arms, put her into it.

'To the Imperial, wherever that is,' he called out to the driver, and then jumped in after Nell and took her in his arms again.

'What are you doing singing at places like these?' he said with a note of despair in his voice. 'Wasn't it enough that Fate, or whatever it is, should drag me down without pulling you down too? And to think of you singing in a music-hall—a music-hall—*you!*'

'I had to; it was all that was left. I've never been able to sing as I ought to sing since—since that night, Jacky. It was the only means I had

of earning a living, and—and I had to support my boy.'

'Your *what?*'

'My boy, my little son, *our* little son, Jacky—yours and mine. He was born eight months after—after that night. Oh Jacky, we've both failed, both gone to the bottom of the ladder, and if we never can fight our way up again, can't we just be together, dear?'

'Always together, Nell—always, dear,' he said in reply. 'But we won't stay down. I'll fight my way up again for you and for the boy.'

The cab stopped suddenly. They were at the stage-door of the Imperial.

A word with the stage-manager gave Havisham *entrée* behind the scenes for that one night; and while husband and wife were busily engaged in discussing matters in the slips, the bell rang and Nell's 'turn' came.

'Poor little woman! She's a hard worker, and ought to succeed,' said the stage-manager feelingly, 'and I always give her a turn when I can, Mr Havisham; but, somehow, she doesn't catch on with the audience, and never—— God's truth! what's that?'

It was Nell's voice, ringing out like a clarion—out and up, and trilling with all the lark-like splendour of those old studio days. Havisham recognised it, Havisham realised it, and something like a laugh sounded far down in his throat as he joined in the general movement towards the wings, and looked out, as the stage-hands were doing, to where Nell was standing and singing to a hushed house.

At the end of the first verse it fairly rose at her, and Havisham made that odd noise far down in his throat again. This was the Nell of those other days; this was the singer her instructors had expected to give the world.

She realised it herself, and, turning, smiled back at Havisham before she took up the second verse. Something in her happy face and shining eyes inspired him with a desire to make a picture of her in that moment of long-deferred triumph, a picture of what their reconciliation meant to him—to her—to the child who belonged to both.

A shilling slipped into the property-man's hand brought a sheet of paper and a stick of charcoal; and, making an easel of the wall, he sketched the outline of it there and then. The stage-hands turned from the singer to the artist, and crowded round him as he worked, laying in rapidly the shadowy outlines of an amazing conception.

'By Jove, you know, that's ripping!' said the stage-manager, turning suddenly and seeing the picture. 'And done off-hand like this! Look here, old chap, you could make a first-class "turn" out of work of that quality. It would simply go like wildfire.'

'You think it's good, then, do you?'

'Good? Good's no name for it; it's simply marvellous. And I know something about art, I can tell you. Take my advice and make a "turn" out of it.'

'I have made a "turn" *with* it,' said Havisham, laughing for sheer joy. 'I shall call this thing "The Soul's Awakening" when I come to work it out on canvas. Ah, hear her sing! Hear her—my Nell!'

'Upon my soul, old chap, you're a marvellous pair! What have you and your wife been doing with yourselves all these years, unknown, and with talents like these hidden under a bushel?'

'Ah—what?' said Havisham.

And when Nell came off the stage at the end of her first song, and, unmindful of the cheers that rang out for her own success, looked at the picture, and said 'Oh!' just as she said when the 'Ariadne' was first sketched, he took her in his arms and whispered, 'I know now what I needed—what we both needed, dear. And, thank God, I found it out in time! There, go, take your encore, Nell; they'll have the roof down if you don't. Besides, I want to see the boy. Hurry, dear, and get your turn over, and then we'll go home.'

'I am "home" now,' she said as she looked up into his eyes; and then, breaking out of his arms, she went back to the stage of the Imperial—of *any* music-hall—for the last time.

As for the rest, you can read it any day in the catalogue of the National Gallery, and read it in these words:

'No. 46—"The Soul's Awakening." J. Havisham, R.A.'

THE END.

THE MONTH: SCIENCE AND ARTS.

ICE TUMBLER FOR COOLING DRINKS.

An interesting novelty which will probably come into extensive application in hot weather has made its appearance on the Continent. This is a tumbler made, not of glass, but of ice. Certainly, sipping a drink from such a vessel is preferable to the general practice of immersing a piece of ice in a glass containing the liquid to effect the requisite cooling, since greater efficiency is assured. The tumbler is of fairly stout construction, and is easily made. A mould conforming with the desired shape of the vessel is filled with water, which is then frozen solid, and after removal is slipped into an outer paper envelope for convenience in handling and to protect the ice from the heat of the hand or surrounding atmosphere. The goblet is made fairly thick at the base or foot, becoming thinner at the rim. The size at present

made is about five inches in height, weighs nearly four ounces, and holds some nine fluid ounces. When the receptacle is turned out of its mould it has the appearance of porcelain, but if preferred it can be tinted, it only being necessary to add a small proportion of harmless colouring matter to the water with which the mould is filled. The average life of the goblet is about half-an-hour in the ordinary summer weather experienced in this zone, which is sufficient for the purpose. The liquid poured into the tumbler has its temperature far more appreciably decreased by contact with the surrounding ice than is possible with the ordinary method of immersing a piece of ice in the glass containing the liquid.

NATIONAL PROSPERITY AND VITAL STATISTICS.

The recently published statistics concerning the death and birth rates in this country have occasioned considerable discussion. The low rate of the former testifies to the excellent work which has been accomplished by those concerned in the questions of hygiene and sanitation, and which has resulted in a proportionate reduction in the ravages of disease. The low record of fifteen per thousand which was touched in 1907 places this nation among the healthiest of the world. But the serious fall in the birth-rate has provoked considerably greater disquietude, the fall being from about 36 in 1876 to 26·3 in 1907. The preternaturally sage regard this as an ominous outlook, and by mathematical calculation have ascertained that if this rate of fall be continued there will be no children born in this country by the end of the present century. It is difficult to see how such a contention can be substantiated, since it is a well-known fact that Nature possesses the happy faculty of accommodating herself to prevailing conditions. The multiplication of animals in their wild state is governed by the facilities available for maintaining life. As these increase and decrease so does the proportion of young in a corresponding degree, the ratio of births consequently fluctuating like a barometer. If such is the case among the lower orders of creation, why should it not apply to mankind? In periods of industrial depression the struggle for existence among the living becomes acute. Nature, with her wonderful discrimination, realises that increase in the population under such circumstances imposes a heavier tax upon the living by the provision of more mouths to feed, which means that the welfare of the people is seriously sapped owing to an appreciable proportion of the sustenance necessary for their maintenance being diverted into another channel. On the other hand, in periods of prosperity, the people in reality receive more than is requisite for their preservation at Nature's level of strength, and accordingly the birth-rate increases. As is well known, the prosperity of this country has been steadily declining for many years past, though short periods of brightness have spasmodically appeared here and there to relieve the prevailing gloom. When the tide turns and the dawn of a prolonged period of plenty appears, so will decline in the birth-rate be arrested, though such will not be instantaneous, as a certain period must perforce elapse before the population can recover from the privations it has experienced.

IMPROVING SUPERPHOSPHATE SACKS.

Those concerned in the superphosphate industry are only too painfully aware of the immense loss that is incurred in the wastage of the sacks in which this fertiliser is packed for transit and storage. This result is attributable to the action of the free acid in the manure, which sets up rapid and severe decomposition of the material of which the bags are made. The losses in this direction are reflected in the enhanced cost of the material to the farmer. Consequently any development which can be effected with a view to reducing this wastage to the minimum is of supreme importance to the farmer, who stands in the relationship of consumer. The official analyst of one of our enterprising Colonial Governments has been carrying out prolonged experiments in this field, and has now succeeded in devising a commercially practicable method of overcoming the wastage by inexpensive means. This consists in treating the bag with a strong solution of red gum kino. A bag submitted to this protective process was filled with a consignment of this fertiliser, which was of a very acid character, and which had within a very short space of time completely rotted the double bag in which it was packed. The new sack when filled was placed in storage for six months, with a number of ordinary bags packed with similar manure surrounding it on every side. At the end of this period it was found that while the ordinary sacks had quite decomposed, that submitted to the kino process was as strong and intact as when it was filled. This test was of a peculiarly searching nature, owing to the high acid content of the superphosphate, and was considered so satisfactory that the treatment has been taken up by many of those concerned in the industry. The process has the advantage of being cheap and simple, and for this reason it is hoped that it will come into extensive vogue.

NEW BUILDING SYSTEM FOR CHEAP DWELLINGS.

The demand for cheap dwellings for the working classes has resulted in commendable activity being displayed in the devising of ways and means for reducing the cost of construction. It has been found, however, that under present conditions and with existing materials there is an irreducible limit in cost beyond which it is impossible to go—that is, if due regard is to be given to satisfactory workmanship. And even this point is so high as to militate against the exploitation of the idea upon the extensive lines anticipated. Consequently any new materials for or principles of construction are in great demand so long as they comply with official requirements. One of the

latest of these (tests with which appear to have been eminently successful) is the reinforcing or strengthening of ordinary brickwork with wire-netting which has been evolved by a firm in the north of England, and which is now being adopted for the erection of cheap cottages. Practically speaking, it enables the amount of brickwork to be very materially reduced without any sacrifice of strength. In this arrangement layers of the wire-netting are embedded in the joints of ordinary brickwork, converting the whole into a monolithic mass. It is stated that a wall built upon this principle with bricks placed on edge is much stronger than the ordinary nine-inch brick wall. The proposition at present entertained is to build up a hollow wall on this system, with the outer half of half-brick and the inner section of three-inch thickness. It is claimed that such a wall is stronger than one of fourteen inches built under existing conditions. Such a development will result in its becoming possible to erect artisans' dwellings at a much lower cost than is at present feasible, owing to the great saving in the quantity of bricks required. For purposes of demonstrating the strength of such a system, a wall five feet long by three feet wide and only four and a half inches thick—the equivalent of a single-brick wall—was built in accordance with the above reinforcing method, and laid flat on its side with a support at either end. This left a clear space underneath four and a quarter feet in length. The wall was then loaded as near its centre as possible until a weight of nearly one and a half tons was imposed without causing it to break. When it is remembered that a nine-inch wall of similar dimensions would have collapsed probably under a much lighter weight, the value of the system may be realised.

SIGHT-METHOD OF PIANOFORTE-PLAYING.

It was the great Czerny who said, 'Rules that we have in our heads only are valueless to the performer; they must be in our fingers as well. The fingers must know as well as the head.' It must be admitted that the generally practised methods of teaching the pianoforte are laborious and in accordance with dryasdust principles. Many a student is an excellent executant but an indifferent sight-reader, and is apt, owing to deficiency in the last-named direction, to regard sight-reading as a gift. According to Mr Ehremayer, however, knowledge and practice on really scientific lines can to a great extent supply the place of natural-born instinct. He has evolved a system of sight-playing which possesses many features of interest, and the explanation of which is certainly worth perusal. He maintains that sight-playing does not depend upon an accurate knowledge of the relationship between notes and keys, but in the establishment of an automatic and practically instantaneous connection between the observation of the musical symbols and the muscular actions necessary for their production as musical sounds. He explains how these muscular actions and the symbols which represent them can be thoroughly associated together by the practical application of certain laws. Such a contention is scientifically correct, since there is undoubtedly a sympathetic combination between the two which results in the fingers automatically translating the musical symbols as read by the eye into their corresponding audible tones instantaneously, and there is no reason why careful training of observation and muscular action should not be capable of development upon some such lines as he suggests. Ask an accomplished sight-player how he is able to translate so readily the symbols he reads with the eye into their relative notes, and he is at a loss to explain. He merely observes that the fingers instinctively follow the interpretation of thought, which points to a very intimate association of the two faculties.

INGENIOUS RAILWAY-TICKET PRINTING-MACHINE.

The methods adopted by our railway companies in providing extensive racks around the booking-office for the storage of tickets is certainly crude. Not only does it entail a stock being retained for each class and station upon the system already printed, irrespective of demand, but it involves considerable delay in the issuing of tickets, which is most noticeable during rushes, not taking into consideration the expense entailed in printing the same; while, should the supply for a certain station become exhausted, recourse has to be made to handwriting. Again, the clerk has to record every sale upon his check-sheet, so that at the end of the day there may be absolute harmony between the tickets sold and the till. The German Government has recently adopted a novel device whereby this labour is reduced to the minimum, and its recent introduction into this country should result in its utilisation at our railway centres. It comprises a machine about three feet in length by four feet high and twenty inches wide, so that it can be placed conveniently beside the ticket-office window. The machine which is in operation at Cologne is designed for use in thirteen hundred stations; but the apparatus can be adapted to any number as required by the exigencies of the railway by which it is used. The machine is very simple in design. It carries as many printing-plates as varieties of tickets required for issue from the station. The names of all stations are arranged in alphabetical order on a scale. On a ticket being demanded, the clerk inserts a blank piece of cardboard of the conventional size into a sliding-carriage, which is the printing apparatus, moves it along until it is opposite the name of the station required on the indicator, depresses the handle, and immediately the ticket drops out imprinted with the name of the departure and arrival stations, date, consecutive number, fare, route, class of carriage, and any other fact that may be required. At the same time a duplicate is printed on a

continuous sheet, so that no booking operation by the clerk is necessary. No card can possibly be printed by any unauthorised person without being registered on the control-sheet, which cannot be altered by the clerk. Misuse is out of the question, and the booking-office is proof against theft, since no ticket is of any use until passed through the machine, being merely a blank prior to this last-named operation. Any type of ticket can be issued without delay, including excursion, tourist, privilege, workmen's, season, dog, vehicle, &c., tickets. The machine appreciably facilitates the task of the clerk, and tickets can be issued far more quickly than by the existing method, one official at Cologne station having issued five hundred tickets in an hour by this machine. Upon completion of the day's duties, the clerk has simply to total the amounts recorded on the duplicate-sheet and balance with his till. Clandestine printing of tickets is entirely prevented, as the plates for printing the tickets cannot be withdrawn except by the printing apparatus itself, which is returned to its original position directly after impression. The success of the apparatus in Cologne has resulted in its adoption upon not only the German, but also the Swedish, Danish, and Austrian State railways. It is equally applicable to other phases of business where tickets are issued, and of which it is advisable to retain a duplicate record of sale, such as theatres; while in Germany it is being extensively used in connection with slaughter-houses.

A NEW TEA-FANNER.

A new machine which will appeal to all those interested in the tea industry, and which has been devised by a well-known Indian tea-planter, has recently been placed on the market as an addition to existing sifting facilities and for the thorough completion of this operation. By means of this fanner all fibre, fluff, dust, and similar foreign substances are completely and rapidly eliminated from the product.

A SERVICEABLE INCANDESCENT PETROL GAS-LAMP.

The perfection of the incandescent gas-lamp has resulted in the more extensive use of petrol vapour as a lighting medium, and various devices working on this principle have come into vogue. Certainly, when constructed upon rational lines, an inexpensive, simple, and highly efficient illuminant is rendered available. One of the best of these which we have seen, yielding a light of between eighty and one hundred candle-power, is of American origin, and owing to its safety has received the approbation of many of the fire insurance corporations on the other side of the Atlantic. Gas consumption is very low, one quart of petrol, costing about three-pence, sufficing for some fifteen hours. Each lamp is self-contained, and possesses the minimum of component parts, so that it cannot easily become deranged. The petrol feed to the burner, where it becomes vapourised by heat, is by gravity, so that a uniform pressure is always maintained, and the flow of liquid can be adjusted to a nicety so as to secure the maximum of efficiency with the minimum of consumption. The lamp is made in a variety of styles; it can be suspended from the ceiling, attached to a wall on a swinging bracket, or used as a table or stand lamp with equal facility. Owing to its construction, leakage is impossible, while it cannot catch fire, and even upon exhaustion of the reservoir the flame quietly dies out. It is an excellent device for rural districts, and affords an inexpensive and brilliant system of lighting for either the luxurious mansion or the humble cottage. Owing to the fact that the reservoir is well removed from the area of heat radiation, the liquid is always preserved at an even temperature, and gas is only generated as required. In the United States it has come into extensive use not only for indoor but also outdoor lighting, it being possible in the arc form to obtain a light of enormous candle-power at trifling cost. In this direction it should have an extensive field in Britain, since the lighting of our country villages, where public supplies of gas or electricity are not available, is deplorable. For such work an excellent pattern has been devised, the lamp, resembling that used in connection with gas in our town and city thoroughfares, being fitted with an external small reservoir. The lamp is stormproof, and is unaffected by cold weather, while it constitutes the cheapest form of street-lighting that has yet been devised. The possibility of obtaining a brilliant, steady light of one hundred candle-power at less than a farthing per hour should give this lamp an extensive vogue.

MANUFACTURING METAL RIBBON.

An ingenious invention has recently been evolved, the product of which should find a ready market for a variety of purposes. This is the manufacture of metal in the form of ribbon by an exceedingly simple, rapid, and inexpensive process. A water-cooled brass cylinder about five inches in diameter is rotated at a speed of about sixteen hundred revolutions per minute. While it is rotating at this velocity a thin stream of molten metal is allowed to fall on to the surface of the drum. Immediately it comes into contact with the latter it solidifies, and by centrifugal force is thrown off in the form of a continuous band of ribbon about a quarter of an inch in width by about the five-hundredth part of an inch in thickness. By means of this process some twenty-eight pounds of tin shaving can be produced per hour. The process is available for use with a variety of metals, such as lead, zinc, tin, and so forth.

A NOVEL SOCIABLE MOTOR-CYCLE ATTACHMENT.

Though the side-by-side principle of carrying a second passenger on a motor-cycle is preferable to the trailer, it possesses many disadvantages. It is in order to overcome these defects that the 'new-departure' sociable rear-car has been introduced.

In this arrangement the seat is placed over the back wheel in such a way that the occupant faces sideways to the right of the cyclist, and yet is so close to him as to enable conversation to be carried on without difficulty. The cycle has a third wheel, as in the ordinary side-car attachment; but instead of this auxiliary wheel being spaced forty inches, it is only twenty-four inches from the back wheel of the cycle. When he is seated, the weight of the passenger is distributed uniformly over the rear wheel; and as the greater part of the whole is immediately behind and in line with the cyclist, the resistance to head-wind is considerably reduced. From the technical point of view, also, the arrangement imposes less strain upon the motor, as the latter has not to labour against the long leverage of the passenger and car when disposed beside the cyclist. Consequently even a low-powered engine can perform its work more efficiently and without undue effort even in hill-climbing. Another conspicuous advantage is the arrangement adopted to circumvent excessive tilting when rounding corners. Beneath the foot-rest of the rear car is placed a small six-inch stout castor-wheel which is normally one inch off the ground. In rounding a corner on the right side, directly the vehicle inclines half an inch the castor-wheel comes into contact with the ground and acts as a support, tending to restore the normal equilibrium of the cycle. Similarly, when the vehicle is at a standstill and the passenger is alighting or stepping into the seat, overbalancing is prevented. The car can be attached or detached in three minutes, and the machine can be stowed in a space measuring only twenty-eight inches wide. Certainly, the car is the safest sociable that has yet been devised; while the passenger, having full range of view not only to the front but in the rear of the car, can warn the cyclist of anything approaching from behind. The car is well sprung, so that riding therein is rendered comfortable.

RABBIT-FARMING.

The wild rabbit in good condition is readily marketable and profitable, and Mr J. Simpson, in his *Wild Rabbit in a New Aspect* (Sheffield: Pawson and Brailsford), is an apologist for more systematic methods of culture, whereby it may be made even more important commercially. The methods recommended are original and practical. The results, as set down here, of Lord Wharncliffe's experimental rabbit-warren in Wortley Hall Park are most encouraging. By his methods, Mr Simpson believes landowners or farmers may raise as many rabbits as they desire for sport and profit, and at the same time by confining them to one spot rid their woods and farms of destructive scourges. The loss caused in woods by rabbits he considers enormous. The scheme at Wortley is based on the principle of regarding the rabbit in the same light as any other farm stock. It thrives best and pays best on good, rich pasture, and as long as this can be had no artificial feeding is required. Rabbits are closer and more economical feeders than cattle or sheep. The enclosed warren at Wortley, on old park-pasture, produces between fifty and one hundred rabbits to an acre annually, which at from one shilling to one shilling and threepence per rabbit yield a good profit. Here they are not less prolific than in the open, and no more liable to disease. Furze is the best of coverts. The Wortley trap-fence is explained, there are chapters specially for farmers and allotment holders, and hints are given for treating impoverished land with gas-lime and salt. Mr Simpson believes that whatever is worth doing at all is worth doing well, and that more will be made by systematic treatment than by hap-hazard methods. Instances are mentioned of a farmer in Lincolnshire who made a considerable fortune early last century by rabbit-culture, and of a farmer in Mull who sends seven thousand to market annually.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

AT THE BEND OF THE ROAD.

At the bend of the road, when the lilacs were blooming,
I met you at first, and I passed on my way
With a strange new delight in my spirit unfolding,
As blossoms awake in a morning of May.

At the bend of the road tall white lilies had lifted
Their heads o'er the fence when I saw you again;
They seemed fairest ladies all dressed to attend you—
The queen that had come in my palace to reign.

At the bend of the road, love, the people they cheered us,
As homeward I brought you, my beautiful bride;
And ruddy ripe apples were clustering above us,
True emblems, methought, of my joy and my pride.

At the bend of the road—ah, my soul, look beyond it!—
How glorious she walks in her blissful abode!
Where the pathway of Earth joins the pathway to Heaven,
We shall meet ne'er to part—at the bend of the road.

THE BLUNDERERS.

By Lady ALICE FERGUSSON.

CHAPTER I.

THE Reverend John Duncombe sat in his study, jotting down the heads of his sermon for the following Sunday. He was a tall, thin man, with a grizzled beard, a narrow forehead, and cold gray eyes. His table faced the long, open window which gave on to the garden; and his eye was suddenly caught by the slim, white-clad figure of a girl crossing the sunlit lawn.

He paused, pen in hand; then slowly pushed his paper aside and laid the pen down.

'Francesca,' he called, 'I want to speak to you.'

Francesca came over the grass and stepped on to the threshold of the room. The sunshine caught her brown hair, and showed gold lights in it, as she stood looking in.

'You look tired, father,' she said, noting the shadows under his eyes.

Her father made no answer, but pointed to a chair. She entered with a half-sigh, as if reluctant to leave the light and fragrance of the garden. She seated herself on a chair just inside the room, and her eyes strayed to the rose-bush where she had left her basket and scissors. Her love for flowers was as marked as was her father's indifference to them. In this as in everything else, she often thought, they were leagues apart.

'Francesca,' her father began, 'you are twenty-two, are you not?'

'Yes,' she said, wondering what was coming.

'Your mother,' he said gravely, 'was married at nineteen.'

'Is this a reproach?' Francesca asked herself, inwardly amused. 'What *can* he be thinking of?'

His next words really startled her.

'It is time you were married,' he said. 'You know, of course, or you ought to know, that I have very little to leave you. Life is uncertain, and I am no longer a young man. I have always thought that a girl ought to marry as soon after twenty as possible.'

'Give me time, father,' Francesca answered, trying to lighten the tone of the conversation. 'I haven't had many opportunities yet, have I? And I don't want to go away from home,' she ended timidly, for Mr Duncombe always frowned upon anything approaching to sentiment.

'As for the last reason,' he replied grimly, 'it is frequently necessary in this life to lay our inclinations on one side. With regard to an opportunity, that has fortunately occurred. Mr Blake wishes to marry you.'

Francesca stared. 'It is very good of Mr Blake,' she said. 'But I am afraid I do not wish to marry him.'

'That is a pity. But I have no doubt when you accustom yourself to the idea you will not dislike it. He is well educated and well thought of, he can give you a comfortable home in your own neighbourhood, and he is not too old. If you conduct yourself wisely and sensibly, I see every chance of your being happy with him.'

'Father,' Francesca protested, gently still, for she had seldom dared to differ from this cold arbiter of her fate, 'I do not understand you. You have hardly ever mentioned the word marriage to me in my life, and now you are talking as if a marriage between Mr Blake—whom I hardly know—and me were a possible and probable event. Do you mean that he has spoken to you about it?'

'He spoke to me yesterday as we were walking home from Barstone. As it happened, I had been thinking a good deal about your future, and had been a good deal perplexed about it. This seems to be the solution. I am pleased with what I have seen of Mr Blake. I have, therefore, given my consent.'

'Subject to mine, I suppose,' added Francesca, wondering if she were in a dream.

'Subject to yours! No, Francesca,' Mr Duncombe answered in a tone of surprise; 'I expect you to trust me to decide what is best for you. He will, of course, speak to you about the matter at an early opportunity.'

[*All Rights Reserved.*]

'Father,' the girl pleaded, 'mustn't one wait to care for a person before promising to marry him? You and I have never talked about these things, and I know I am ignorant and inexperienced; but surely it isn't—it can't be—right to marry a man without knowing him or loving him.' In her earnestness she stretched her hand across the table and laid it on her father's arm—a rare action indeed, for Mr Duncombe did not encourage caresses.

He removed his arm coldly. 'Please, Francesca, do not excite yourself, and do not be sentimental and bookish. I imagine it is a daughter's duty to be guided by her parent. I have always had obedience from you, and I must have it still—until you exchange my care for that of a husband.'

Then something rose up in Francesca. For the first time in her life she defied her father. 'Care!' she said. 'It is custody you mean, not care. You are treating me like a prisoner, and you mean me to remain one till you hand me over to another jailer. You are actually telling me to marry a man against my will. Well, I won't! No, *I won't!*'

To Mr Duncombe it was as if a bomb had fallen and burst before him. The opening words of Francesca's last speech were surprising enough. A petulant outburst from a highly strung nature which had received a shock. Well, perhaps he had broken the news too abruptly, Mr Duncombe thought, as he watched her colour deepening, her breath coming and going between her sentences. But the flat defiance, the throwing down of the gauntlet in the last two words, were so astonishing that for the moment he was dumb. He had all his life been accustomed to implicit obedience from Francesca. If he had given an unusual order he had never thought it necessary to explain or apologise for it. Obedience, he held, was due from children to parents in all times, seasons, and circumstances, unless indeed the parents were manifestly unfit for their responsibilities. And now, for the first time since her motherless childhood, Francesca had defied him. He rose slowly to his feet and faced her, looking at her silently.

She stood before him, her white hands grasping the edge of the writing-table, her eyes wide with trouble, her lips trembling. As he looked at her, his cold gaze seemed to hold her in a spell. Her colour slowly ebbed away. The old fear of him which had overshadowed her childhood came back over her.

'You have forgotten yourself very strangely, Francesca. I am now going down to the village, and will leave you to think over what I have said. Mr Blake will dine with us to-night.'

Francesca escaped to her room. She leaned out of the window, looking with unseeing gaze on the garden, the little field beyond, and beyond that again the quiet village lying bathed in the afternoon sunlight. Her head throbbed, and her heart beat furiously with an anger such as she had never felt before. After the monotony of her life, the quiet routine, the small events which she had grown to believe would form her lot to the end of her days, a chasm seemed to have opened suddenly beneath her feet.

Her eyes turned northwards to where the woods of Scovell Park stretched in rich luxury away from the village. A gray tower rose above them, all that could be seen of the old house lately passed from Lord Scovell's hands to those of James Blake, son of the late James Blake of soda-water bottle fame.

'I have therefore given my consent'—her father's words rang in Francesca's ears. There seemed a terrible finality in the sentence when she remembered the voice in which it had been delivered. On one or two occasions of her life Francesca had made, or attempted to make, a feeble stand against her father's will. Her opposition had been overruled in just that dry, uncompromising tone. He was *terribly* strong, she thought. He had never been unkind to her. He had educated her, almost entirely himself, in a thorough, conscientious kind of way; but he had never made her love her studies any more than he had made her love himself. Yet not in her wildest dreams would she have imagined that his coldness and lack of sympathy or comprehension of her would have led him to this. Her soul revolted from his decision. Yet deep down in her heart she felt he was immeasurably stronger than she, and had the power to make her obey.

To whom could she turn for help? She had no friends of her own class except two elderly ladies, sisters, who were cousins of her dead mother, and lived on the outskirts of the village. They were away on their annual jaunt to Switzerland. A letter might take days to reach them; and, besides, they dared not stand against her father any more than she.

There was Dr Drew, a gentleman, clever in his profession, and Francesca's oldest friend, but weak and ruled by his vulgar wife. Though genuinely fond of him, as a counsellor on this particular occasion she weighed him in the balance and found him wanting.

Of Lady Scovell, in the days before she and her husband sold Scovell Park and left the neighbourhood, Francesca might have made a friend. But her father, distrustful and suspicious of people who were bright, gay, charming, and not of his world, had nipped the friendship in the bud.

There was literally nobody. The village poor loved her and she loved them, but of friends among her equals she had almost none. This was natural, for strangers seldom came to Stellbridge, and she had hardly ever left it. One or two visits to a maiden sister of her father's with whom she had little in common, one well-remembered week's stay in London with her old cousins, these were the glimpses she had had of the world beyond Stellbridge.

At home she taught in the Sunday school and managed the boys' carving-class in the winter. These duties, added to that of housekeeping, were deemed sufficient for her years by the Rector, who never could realise that there could be capability in a

girl. He thus bore alone the burden of many good works, for which, had he but known it, he had a willing and able helper ready to his hand. For the rest, she read, gardened, and played the piano, and, never having known any other lot, had been fairly content.

It was only to-day that a sudden yearning to know more of life came over her. She forgot for a moment the Blake complication. But to stay for ever at Stellbridge till she became narrow-minded like her father, or ignobly contented like Dr Drew, suddenly appeared a hateful prospect. She looked back on her life with a new self-pity; she looked forward with a shudder.

Then her father's plans for her future rushed back to her mind, and with a sob she buried her face in her arms, crying, 'Oh, I am afraid! I am afraid!'

CHAPTER II.

HALF-PAST seven was the Rectory dinner-hour, and at two minutes to the half-hour Mr Blake rang the Rectory bell. His host received him in the drawing-room alone, Francesca joining the two men a few moments later. She did not look at the guest as she shook hands with him; but when they were seated at the dinner-table, and the Rector had engaged him in conversation, some impulse prompted her to examine him with a long, critical gaze.

James Blake was at this time about thirty-eight. He was largely made, with square, erect shoulders. He was not handsome, but his brown eyes were kind and clear, and he had a quiet voice, pleasant to listen to. Not that Francesca was disposed to allow him any advantages either of appearance or otherwise. His small-talk was limited, and his modesty in advancing his opinions led Francesca to the hasty conclusion that he had few worth giving. She remembered that Lily Drew, the doctor's pretty daughter, had pronounced him 'dull;' and, though she and Lily had few ideas in common, she reflected that probably this was one they might share.

During the first two courses the conversation was between Mr Duncombe and his guest. Literature was their chief topic; and they finally fell to discussing a recent religious work, of which Mr Duncombe spoke highly. Mr Blake had not read it, but had seen a review of it.

'I suppose, Miss Duncombe,' he said, turning to Francesca for the first time, 'you do not bother your head with those deep books yet?'

The remark annoyed Francesca. 'I read this one some weeks ago,' she said shortly; adding to herself, 'I suppose he thinks I busy myself with some frivolous girl's paper.'

'Indeed! And what is your opinion on it?' her father asked in a heavily playful tone, as if humouring a child.

'I thought it well written,' Francesca answered slowly, considering her words. 'But one can't sympathise with an author who assumes every one is wrong who doesn't agree with him.'

'In this case,' said Mr Duncombe, with the air of one settling an argument, 'there is no doubt whatever that the author is right; and, that being so, the opposite view must be wrong. There is only one right and wrong in matters of this sort.'

Francesca, half-emboldened by the presence of a third person, opened her mouth to speak; but habit was too strong for her, and she left the last word with her father. Mr Blake looked at her attentively; then his voice broke in on her silence.

'Have you an answer to that, Miss Duncombe?'

She flushed. How could this man suppose it was possible for her to argue with her father?

'Let us hear it, Francesca,' said Mr Duncombe grimly.

'I am afraid I differ from father,' she said, looking at Mr Blake. 'I always feel as if there were a great many different kinds of right.'

'That is a dangerous view,' the clergyman said. 'I hope, Francesca, you have not been reading disturbing literature; that other books do not come into this house except those that I mark for you in your library list?'

'No, father.'

There was a short silence while Elizabeth the maid handed the pudding.

Then Mr Blake turned the conversation on to gardening. 'I don't know if you are acquainted with the Italian garden at Scovell,' he said to Mr Duncombe. 'I am turning it into a rose-garden.'

'Indeed!' said his host, polite but uninterested.

But Francesca turned to him eagerly, forgetting the strain of the situation in the all-engrossing subject of roses. Till the end of dinner they talked unconstrainedly. When they left the dining-room, the remembrance of the ulterior reason for Mr Blake's presence tied her tongue again.

'We must show you our roses,' Mr Duncombe said, leading the way through the drawing-room out into the garden. It was a still June evening. A nightingale sang in a lilac-tree, and the scent of the roses filled the air. Francesca fell a little behind the others as they paced up the centre walk of the garden. Then when they reached the sun-dial, and the guest paused to admire the mass of aubretia clustering round its base, Mr Duncombe murmured something about a chilly evening and a coat, and, to Francesca's horror, hurried towards the house.

For a moment she meditated instant flight. Mr Duncombe's disappearance was obviously premeditated, and she blushed hotly to think how plain its object must be to her companion. Then she found herself struggling with a wild desire to laugh at her father's clumsy and primitive manner of dealing with the situation. Mr Blake's quiet, matter-of-fact tone helped to restore her calm.

'Have you any of Madame Abel Châtenay? Ah yes, I see her; a very fine specimen! Really, it is

difficult to believe you achieve all this with only one man to help you. It does you infinite credit.'

She answered vaguely and hastily. If she could *only* keep the conversation to roses! For ten minutes she succeeded in doing so, and was surprised at the depth of her companion's knowledge of and interest in the subject. At last she thought she might decently suggest a return to the house.

'In a few minutes. Miss Duncombe'——

Francesca's heart beat violently. 'It's coming, then,' she thought.

He had paused, and actually stammered a little when he began again. 'May I—may I speak to you on a subject which is very important to me, and indeed to us both? If you will be patient with me and listen, I shall be very grateful.'

'I will listen, of course,' Francesca answered, inwardly praying that he would be quick.

'I think your father told you of the subject of our conversation when we walked home from Barstone yesterday? It must seem to you that I am presumptuous in speaking so soon, after knowing you so short a time. But when I spoke to Mr Duncombe he was anxious, for reasons which you will appreciate, that I should speak at once. That is my excuse. If you can see enough in me to marry me (Heaven knows, I can't see why you should), I shall be glad and proud. I am a very lonely man—how lonely I didn't know till lately. I should try my best to make you happy, so that you shall have no cause to regret your decision, if you decide as I hope.'

Francesca listened, puzzled. It had not escaped her that he had said no word of caring for her. 'He wants to marry and settle down,' she thought. 'I need have no compunction in refusing him. There is no sentiment about him, and how could there be? He hardly knows me.'

'I'm very sorry, Mr Blake,' she replied aloud; 'but I can only say, No.'

'Miss Duncombe,' he said hastily, 'don't answer now. I want to tell you that I will come back in a week for my answer. Your father warned me,' he went on with a smile, 'that you might give me an unfavourable answer at first. Take time. I will not hurry you; I will wait. But if there is no one else'—he spoke hesitatingly—'I would be as good to you as I know how to be. You would have a garden, and I would do anything for you in my power'—— He stopped short, painfully conscious that he was choosing his words badly, and virtually offering her bribes. 'Miss Duncombe, I am no hand at talking. I can only hope you understand.'

'Yes,' she said, hot with anger, for she doubted no longer that she had read his mind correctly, 'I do understand. You were lonely when you came to Scovell, and had nobody to speak to. You thought it would be the proper thing to marry and settle down, and I was the first suitable person you happened to see down here. I suppose you thought I would do, and that I should be only too glad to go and live at a big house like Scovell, and have a large garden and other things. If my father encouraged you he had no right to. I do not wish to be married, and I am not going to marry you.'

They were standing by a wooden gate which led out into the field. When she began to speak, first surprise, then astonishment, was visible in his face. Then he turned completely from her till she could only see his back. She watched his hands gripping the top of the gate. They were trembling. Was he very angry?

There was a pause, which seemed very long to Francesca. Then he turned round. His face was a little pale, but he looked much the same as usual.

'You have spoken plainly,' he said. 'Thank you for that, at least. I may as well tell you that I am not going to give it up. I shall continue to hope that you may change your mind. I have only one thing more to say, and that is that you have entirely misunderstood me. Good-night.'

Francesca nearly stamped her foot.

'You *must* give it up!' she exclaimed. 'Can't you understand that I have refused you definitely?'

'I have no doubt you have,' he answered; and added, 'Don't you think you might have done it a little more politely?'

With that he turned and walked down the path, leaving her feeling, in spite of herself, a little foolish. Certainly, Mr Blake did not always act and speak exactly as was expected of him.

As she lingered there in the deepening twilight she also felt a growing fear. From where she stood she could just see the study window. In a few minutes, she knew, she must face her father.

(To be continued.)

MOTORING TO-DAY.

By the Right Hon. Sir J. H. A. Macdonald, K.C.B., LL.D.

More than seventy years have passed since a successful attempt was made to conduct road-traffic without the use of animal-power. A few years ago the writer, in a conversation with the late Sir Frederick Bramwell, was assured by him that in his boyhood he had frequently been permitted as a treat to ride upon Hancock's steam coach, which in the early thirties plied regularly between the City and Paddington, then a village on the outskirts of London. Sir Frederick was able to say of it that it did a regular and efficient service. Steam coaches ran also between London and Bath and London and Birmingham, and between Gloucester and Cheltenham, at an average speed of ten miles an hour. And in

Scotland a service was established between Glasgow and Paisley. So efficient was the work done, and so great was the promise held out of usefulness to the community, that the opinion of a parliamentary committee highly favourable to mechanical transit is embodied in a blue-book of the period, in which evidence as to the feasibility and undoubted value of such road-locomotion stands recorded, a lasting testimony to the fact that if such transit died out at that time it was not because of any failure of the means provided, but only because the landed and the railroad combination, blind to their own interests, set up an opposition which was too powerful for the promoters of the novel and successful vehicles. The coming together of these two was a reconciliation of the Pilate and Herod type. There was cordial and implacable hatred between them, but they forgot for the time their differences, and went hand in hand in their uncompromising hostility to power-traction on roads. In Parliament they succeeded in imposing prohibitive tolls, such as two pounds eight shillings for the single journey, and in the country they dug ruts in the roads here and piled up large stones on them there, to destroy the coaches, without regard to the risk of killing the travellers.

These tactics were successful. The result has been that since then all property not near railway lines has been handicapped commercially, and the railway companies have spent millions of pounds sterling on unsatisfactory and often unremunerative branches, giving in many cases an inefficient and slow service, and necessitating an incredible waste of money in transferring goods from cart to train, and again from train to cart, the carting and the breaking of bulk often causing much injury to goods, and making the time of transit over distances up to fifty or sixty miles as great as if the journey had been made by road.

Nothing more was heard of mechanical road propulsion until Thompson in Edinburgh introduced the first power-vehicle running on india-rubber tires, and for a short time a steam omnibus was successfully run between Edinburgh and Leith in the sixties. It was soon, however, hustled off the road by the police as being an illegal intruder, and lay long a derelict in a shed in Leith Walk, Thompson's premature death having removed the presiding spirit, without whose energy things could not be pushed to success.

Thus twice at intervals of twenty-five years was mechanical traction crushed out of existence, because the *laudator temporis acti* prevailed, and vested interests overcame in the struggle which was made to introduce improvement. For fifty years power-traction was limited in Britain to two and a half miles an hour, every vehicle being required to have three men in attendance, one of them carrying a red flag forty yards ahead!

It was Gottlieb Daimler of Cannstadt who first broke in effectively on this enforced stagnation of progress. By demonstrating the possibility of using volatile liquid-fuel to produce a vapour which, when mingled with air, would constitute an explosive mixture similar to that used in the fixed gas-engine, the problem of convenient power-traction on roads was solved. Since then the progress made has been phenomenal. In spite of the jeers of the sceptic, the denunciations of the unenlightened, and the opposition of so-called vested interests, a change has come over road-locomotion which as a revolution in traction has no parallel in the world's history, and from which there will never again be a back-going. When it is realised that twelve years have scarcely elapsed since a modicum of liberty to use the roads was conceded to the power-vehicle, and that not six years have elapsed since a greater speed than ten miles an hour became permissible, the fact that to-day there are in these islands no fewer than one hundred and fifty-six thousand vehicles propelled by mechanical means upon the highways cannot but be regarded as amazing even to those who are eager votaries of automobilism. But such is the fact, and every one who considers the matter without prejudice can come to no other conclusion than that the change, so great already, will be even more vast in the future. The thirty-six thousand horses that have already disappeared off the streets in London alone, and the hundred thousand at least throughout the country, will be followed by thousands more every year; and the public, many of whom were strenuously opposed to the innovation, are gradually passing through the stages of objection, submission, toleration, adoption, and satisfaction, many reaching even to enthusiasm.

Nothing illustrates more clearly the growing change in the view taken by the public than the way in which opinion has veered round; for it is the fact that within the last three or four years the objectors have changed their ground completely. When it was seen that the power-vehicle was irresistibly asserting itself in spite of all opposition in the early part of the present decade, and '*come to stay*' was a mournful utterance in the mouths of the objectors, the usual 'thus far and no farther' tactics of opposition began to be adopted. Said the opponent, 'Well, you may run these things out on the country roads if you will, but you must not be allowed to run them into the towns, and send all our horses capering on their hind-legs and bolting in all directions, and we having ourselves and our children run down all over the place.' I have heard this expressed often and in no measured language. But when in three or four years it came about that the town horse would not take the trouble even to cock his ears at the motor-car, far less run away, the volte-face was highly amusing. Then came the concession: 'Well, I give you the towns, but you must not be allowed to come on to the country roads.' This was said to me in these very words about four or five years ago by a great English country magnate, speaking with perfect gravity, and as if he were stating the most commonplace and incontrovertible proposition, and against which no

remonstrance could be listened to. In saying it he was the mouthpiece of many thousands like those who, if they had had their way, would in 1830 have stopped all railways, in 1880 would have stopped all bicycles, and would in 1896 have forbidden any freedom at all to the mechanical road-vehicle. It will amuse the reader—unless he is an uncompromising 'anti'—to know that this great man informed me only a few weeks ago that he had recently possessed himself of *an autocar of a registered power of sixty horses*, and asked my advice as to what would be a good second car to buy for station work, as his sixty was too fast and big and heavy for use unless a large party was to be carried in it. Thus the same gentleman who had seriously said that he would concede the towns to the motorist, but that he must be kept out of the country, is now getting his country grooms trained at a motor-school, and providing himself with a plurality of cars both for pleasure and utility, and which are for regular use on the country roads off which he was determined to have them warned but a few short years ago. Of course he had an explanation ready. His 'young people' had squeezed him into acquiescing, in their desire not to be left isolated with their jog-trot horse-haulage while all around them were careering about gaily in motor-cars, and he had come to realise, what I had tried to din into his adder's ears years before, that in going from his country seat to London, or *vice versâ*, he could step out at his own door, enter his motor-car, and go direct the thirty miles to his town house in London in the same time—even within the legal limit—that it would take him to drive to the station, wait there for a train, and drive from the terminus in London to his own house, thus saving all the bother and exposure of four changes from one mode of travelling to another in all weathers, with the added risk of trains being late. This gentleman's case is but one of thousands. Of course there are still some of the 'Mr Implacable' type. An individual—a gentleman presumably—wrote the other day: 'A person who takes one of these abominable engines into the beautiful and peaceful English country can possess no sense of what is beautiful, and cannot certainly possess any sense of decency;' and he spoke of all motorists as 'soulless and heartless human beings.' He declined an invitation to lunch at the Automobile Club, saying he would lose his 'self-respect' if he accepted, but he would be glad to accept another invitation 'when a British Government prohibits a motor from going outside the boundary of any large town, and confines them to eight miles an hour inside the towns.' One must suppose that there will always be such people. But soon they will be an infinitesimal quantity, as they are already a negligible quantity. There are many who declared themselves inconvertible who are now in the same position as my friend with his sixty-horse car. Among my own friends there are many who years ago would have 'nothing to do with these noisy, stinking, murderous contrivances' who now use no other vehicle than the autocar.

It is, of course, true that in the early days the autocar was open to a good deal of merited animadversion, just as doubtless the first subduer of the horse had to endure the complaints of the ladies of his wigwam for bringing such a smell-producing, snorting, jibbing animal to career about among their tents, filthifying their camp and knocking down their children. But the difference between the horse and the motor is that wherever horses are there must be insanitary filth, and sometimes uncontrollability born of nerves or vice, whereas it is now certain that a motor-car can be almost too silent for safety, exhales no deleterious matter when properly managed, will not cause annoyance by offensive fumes, and has no will of its own. Who now, when cars are passing in dozens at a time, ever thinks of evil smell in connection with them unless where, once in a way, some carelessness as regards lubrication causes offensive smoke? If the reader asks himself how often he has noticed anything of the kind—say, during the previous fortnight—he finds himself probably unable to remember a case, or if he can, he must admit it to be the exception and not the rule—rather proving it. In the course of any day in London a foot-passenger will be passed by one thousand motor-vehicles in less than three hours, and if he sees one emitting smoke it will attract his notice as something unusual.

Then as regards danger. Of course there is danger. It is quite impossible, according to human experience, that given a hundred and fifty thousand vehicles running on the roads of a populous country there will not be accidents. There is no such thing as absolute safety in any mode of locomotion, fast or slow. All movement in streets or roads has, and must have, its elements of danger; and in the case of animal-traction there is an ever-present risk that the animal may become uncontrollable, either from excitement or vice or fear, or may fail from slipping or stumbling, or may excite others to dangerous uncontrollability. The records of the coaching days testify to the very great number of injuries, fatal and otherwise, which were caused by coach accidents in much greater proportion to the number of persons then travelling than is the case now, even putting the accidents on railways and on the roads together, motor-travelling included. Again, the hundred and fifty-six thousand motor-carriages now traversing the roads must certainly double the mileage which could be done by the same number of horse-carriages, and it is only necessary to ask one's self whether a mileage of something like two millions of miles daily can be done by any class of vehicles, fast or slow, without some accidents occurring, just as among the millions of people who go up and down stairs every day it is a certainty that here one and there one will fall down and be killed or injured. Even the two and a half mile an hour traction-engine and road-roller have their several victims every year, and carts going

at a foot pace have their many victims every year. When one sees people every day walking straight off the pavement on to a causeway crowded with vehicles without first looking up or down, and sometimes a man with his eyes upon a newspaper, or a lady holding down a picture-hat against the wind, it is a matter for surprise that more people are not caught. The day that the above twenty lines were written my breath was taken away by seeing a gentleman, at one of the busiest parts of London, step right in front of a motor-car when it was not a yard from him, and, just seeing his danger at the last second, stagger back again. He had a clear line of sight for the car approaching, if he had looked. The car was stopped dead just over the spot where he would have been lying had he not shrunk back in time. Had the car been going at eight or even six miles an hour he would certainly not have had time to step back, and must have been run over, for there were not two feet to spare. Such things occur almost daily. Children also play all sorts of pranks —cap-throwing or 'last across.' Now and again carelessness leads to mishap, and the motorist is denounced in leaded type under the heading, 'ANOTHER MOTOR VICTIM,' when the sufferer was the victim of his own want of ordinary care. That there are accidents due to default of drivers is true, as it has always been true. Some men there have ever been, and some there ever will be, who will commit abuses on the road, and no good motorist will do otherwise than rejoice when such men meet with their deserts, so that they and others may be deterred from doing dangerous things. But statistics show that while the number of cars upon the road has been increasing enormously there is not a corresponding increase in the number of casualties, and the proportion of accidents which justify a prosecution is very small indeed.

Another change is rapidly coming over the views of the community in regard to road power-traction. Until lately it seemed to be a fixed idea that motor-traction was a selfish luxury of the wealthy, and an enemy to the welfare of the rest of the community. Fists were freely shaken, and now and again whips were vigorously used, at the heads of motorists to indicate the feeling of the ordinary citizen towards those who used mechanical vehicles upon the road. 'Civis' wrote to his daily organ to say that 'nothing but absolute prohibition will meet our just requirements.' These words are quoted from a letter which was published as an expression of public opinion. Clergymen dubbed motor-vehicles 'engines of Satan.' Magistrates speaking from the Bench declared them to be 'ten times more dangerous than horse-carriages.' A coroner told a jury that 'God made horses for the use of mankind, and the devil invented motor-cars for the destruction of mankind.' I wrote to this coroner, expressing my interest in statistics, and requesting him to give me a note of the number of persons killed within his jurisdiction (Shrewsbury), whether by autocars or other vehicles, during the two previous years. After writing twice without receiving the courtesy of an acknowledgment, I wrote to the town-clerk; but he—I doubt not after communication with the coroner—failed to acknowledge my letter. Later a doctor of medicine in Chester in the local council succeeded in defeating a motion for a motor-omnibus service by asserting it as a well-known fact that wherever such omnibuses were introduced the rate of mortality among infants was substantially increased. To him I also wrote twice, asking for the statistics, and met the same courtesy from him as I received from the officials of Shrewsbury. It so happened, however, that this assertion was absolutely refuted the following week. At that time there were a thousand motor-omnibuses running in London, and only a few days after this M.D. had made his statement the official statistics of mortality for London showed a figure lower than had ever occurred before, and very low for any large town, being only fourteen and a fraction per thousand.

But notwithstanding these and similar not very creditable attacks by responsible officials, which they were quite unable to substantiate, it began gradually to dawn upon the public mind that the new vehicle was desirable for many purposes of public utility, apart altogether from sport or pleasure. Accordingly chief constables, road surveyors, sanitary inspectors, water and lighting officials, and many other public servants whose duties require them to move about during their working hours are now being conveyed in motor-vehicles. Fire-engines, water-carts, dust-carts, poorhouse omnibuses, burgh ambulances, asylum conveyances, driven by mechanical power, are being supplied out of the rates for municipal service. Mail-vans in large numbers for distances, such as between London and Dover, and London and Oxford, are now being driven by mechanical power.* Large warehouses have their veritable fleets of motor-wagons. Vegetables are conveyed from many miles out of London to Covent Garden Market in half the time occupied by the lumbering horse-wagons of the past.

But a few days ago the Town Council of Glasgow were solemnly considering the adoption of motor-vehicles to convey members and magistrates to the different district offices and police courts, and a paragraph appeared stating that the Lord Provost was to be supplied with a motor-car instead of a carriage for his municipal work. Every now and again we read of a bishop being presented with an autocar to aid him in his ambulatory visits of his diocese.

But most remarkable of all is the fact that the railway companies are establishing services of omni-

* Since this was written the announcement has been made that the Postmaster-General, who till now has always had the road-mails carried by contract, is about to add a motor service to the postal establishment, the vans to be owned by the department and driven by post office officials.

buses in connection with their lines, and in places where they have not done so the inhabitants are either memorialising them to provide such services or are themselves taking steps to introduce motor-transit. For three years among the mountains of Sutherlandshire a mail and passenger service has been in operation over the wild forty miles of road between Lairg on the Highland Railway and Tongue on the extreme coast of the country, thus supplying two places which formerly were a whole day's journey apart with a three to four hours' service, effectively opening up a new and beautiful country to the traveller. Only a few days ago the inhabitants of a wild country in Ross-shire, between Achnasheen on the Highland Railway and Gairloch on the coast, held a meeting, at which the parish clergyman presided, and the head schoolmaster moved a motion, which was carried by acclamation, to form a company of the inhabitants to establish a motor service between the two places. The meeting had 'no doubt that the venture will be in time a good paying concern. *The chairman and several members of the meeting spoke strongly against an attitude of opposition which had been taken up by those interested in the coaching and steamer connections'!* The report adds that 'it seems a pity that the districts of Poolewe, Inverasdale, and Aultbea will not benefit by the new company's proposals.' Any one who would have put such a paragraph in the newspapers five years ago would have been supposed to be endeavouring to produce a rival skit to the *Glenmutchkin Railway* of William Edmonstoune Aytoun.

There is one delusion in regard to the motor-vehicle, which is that it is a luxury of rich and idle people, and this is a chief cause of its unpopularity in some quarters. Now, this idea is a delusion, and the proof that it is so is easily given. Observation shows that it is at the time of day when business men are going to their offices that the autocar traffic far exceeds the private carriage traffic. In Edinburgh, observation in Princes Street between 9.30 and 10 A.M. brings out the extraordinary fact that during two months of the winter 1908–9 there were four hundred private autocars and only one hundred and sixty-seven private carriages running. Similar observation of the City-going traffic on London Embankment for four days in the second week of February 1909 brings out the following figures: six hundred and three motor-cars, one hundred and seventy private carriages.

As regards cabs, London is the only place where as yet the taxicab has taken a predominant place. On the same four occasions the numbers were: five hundred and seventy-three taxicabs, one hundred and seventy-one hansoms.

It is significant that a few weeks ago it was announced that a new lettering for autocars licensed in London had become necessary. The lettering has been changed for each ten thousand vehicles, and the announcement means that already forty thousand motor-vehicles have been licensed in the Metropolitan District. In 1900 there were not five thousand motor-vehicles in the whole of the British Islands. To the new generation the autocar will be a matter of course. Just as the horse of to-day, foaled since motor-traffic began, learned as it looked over the hedge when at its mother's side to treat the autocar as a thing of course, so those who are now young will look upon the motor-cycle and the motor-car as the generation passing away looked upon the dogcart and the carriage. People cannot go on declaiming against what is accepted by the community, for they will get no listeners outside their own insignificant coterie.

The matter of real public interest now is the road. Let all turn attention to the road. It is there that change is needful. History will tell how the advent of the autocar compelled proper attention to be given to road-making, a thing much neglected when road traffic ceased to be general in consequence of the introduction of railways. Road construction that will minimise mud, and thereby minimise dust, and thus give an even surface, without holes, is the question of the hour. The question of power road-locomotion is already finally settled.

THE HOUSE OF WHISPERS.*

By William Le Queux.

CHAPTER XXIII.—WHICH SHOWS A SHABBY FOREIGNER.

FELIX KRAIL, his cigarette held halfway to his lips, stood watching the effect of his insinuation. He saw a faint smile playing about Flockart's lips, and knew that it appealed to him. Old Sir Henry Heyburn had laid a clever trap for him, a trap into which he himself believed that his daughter had fallen. Why should not Flockart retaliate?

The shabby stranger, whose own ingenuity and double-dealing were little short of marvellous, and under whose watchful vigilance the Heyburn household had been ever since her ladyship and her friend Flockart had gone south, stood silent, but in complete satisfaction.

The well-dressed Riviera-lounger—the man so well known at all the various gay resorts from Ventimiglia along to Cannes, and who was a member of the Fêtes Committee at San Remo and at Nice—merely exchanged glances with his friend

* Copyright in the United States of America by the Authors' and Newspapers' Association, New York, 1908.

and smiled. Quickly, however, he changed the topic of conversation. 'And what's occurring in Paris?'

'Ah, there we have the puzzle!' replied the man Krail, his accent being an unfamiliar one—so unfamiliar, indeed, that those unacquainted with the truth were always placed in doubt regarding his true nationality.

'But you've made inquiry?' asked his friend quickly.

'Of course; but the business is kept far too close. Every precaution is taken to prevent anything leaking out,' Krail responded.

'The clerks will speak, won't they?' the other said.

'*Mon cher ami*, they know no more of the business of the mysterious firm of which the blind Baronet is the head than we do ourselves,' said Krail.

'They make enormous financial deals, that's very certain.'

'Not deals—but *coups* for themselves,' he laughed, correcting Flockart. 'Recollect what I discovered in Athens, and the extraordinary connection you found in Brussels.'

'Ah, yes. You mean that clever crowd—four men and two women who were working the gambling concession from the Dutch Government!' exclaimed Flockart. 'Yes, that was a complete mystery. They sent wires in cipher to Sir Henry at Glencardine. I managed to get a glance at one of them, and it was signed "Metaforos."'

'That's their Paris cable address,' said his companion.

'Surely you, with your network of sources of information, and your own genius for discovering secrets, ought to be able to reveal the true nature of Sir Henry's business. Is it an honest one?' asked Flockart.

'I think not.'

'Think! Why, my dear Felix, this isn't like you to only think; you always *know*. You're so certain of your facts that I've always banked upon them.'

The other gave his shoulders a shrug of indecision. 'It was not a judicious move on your part to get rid of the girl from Glencardine,' he said slowly. 'While she was there we had a chance of getting at some clue. But now old Goslin has taken her place we may just as well abandon investigation at that end.'

'You've failed, Krail, and attribute your failure to me,' protested his companion. 'How could I risk being ignominiously kicked out of Glencardine as a spy?'

'Whatever attitude you might have taken would have had the same result. We used the information, and found ourselves fooled—tricked by a very crafty old man, who actually prepared those documents in case he was betrayed.'

'Admitted,' said Flockart. 'But even though we made fools of ourselves in Athens, and caused the Greek Government to look upon us as rogues and liars, the girl is suspected; and I for one don't mean to give in before we've secured a nice, snug little sum.'

'How are we to do it?'

'By obtaining knowledge of the game being played in Paris, and working in an opposite direction,' Flockart replied. 'We are agreed upon one point: that for the past few years, ever since Goslin came on the scene, Sir Henry's business—a big one, there is no doubt—has been of a mysterious and therefore shady character. By his confidence in Gabrielle, his care that nobody ever got a glance inside that safe, his regular consultations with Goslin (who travelled from Paris specially to see him), his constant telegrams in cipher, and his refusal to allow even his wife to obtain the slightest inkling into his private affairs, it is shown that he fears exposure. Do you agree?'

'Most certainly I do.'

'Well, any man who is in dread of the truth becoming known must be carrying on some negotiations the reverse of creditable. He is the moving spirit of that shady house, without a doubt,' declared Flockart, who had so often grasped the blind man's hand in friendship. 'In such fear that his transactions should become known, and that exposure might result, he actually had prepared documents on purpose to mislead those who pried into his affairs. Therefore, the instant we discover the truth, fortune will be at our hand. We all want money, you, I, and Lady Heyburn—and money we'll have.'

'With these sentiments, my dear friend, I entirely and absolutely agree,' remarked the shabby man, lighting a fresh cigarette. 'But one fact you seem to have entirely overlooked.'

'What?'

'The girl. She stands between you, and she might come back into the old man's favour, you know.'

'And even though she did, that makes no difference,' Flockart answered defiantly.

'Why?'

'Because she dare not say a single word against me.'

Krail looked him straight in the face with considerable surprise, but made no comment.

'She knows better,' Flockart added.

'Never believe too much in your own power with a woman, *mon cher ami*,' remarked the other dubiously. 'She's young, therefore of a romantic turn of mind. She's in love, remember, which makes matters much worse for us.'

'Why?'

'Because, being in love, she may become seized with a sentimental fit. This ends generally in a determination of self-sacrifice; and in such case she would tell the truth in defiance of you, and heedless of her own danger.'

Flockart drew a long breath. What this man said was, he knew within his own heart, only too

true of the girl towards whom they had been so cruel and so unscrupulous. His had been a life-long scheme, and as part of his scheme in conjunction with the woman who was Sir Henry's wife it had been unfortunately compulsory to sacrifice the girl who was the blind man's right hand.

Yes, Gabrielle was deeply in love with Walter Murie—the man upon whom Sir Henry now looked as his enemy, and who would have exposed him to the Greek Government if the blind man had not been too clever. The Baronet, after his daughter's confession, naturally attributed her curiosity to Walter's initiative, the more especially that Walter had been in Paris, and, it was believed, in Athens also.

The pair were, however, now separated. Krail, in pursuit of his diligent inquiries, had actually been in Woodnewton, and seen the lonely little figure, sad and dejected, taking long rambles accompanied only by a farmer's sheep-dog. Young Murie had not been there; nor did the pair now correspond. This much Krail had himself discovered.

The problem placed before Flockart by his shabby friend was a somewhat disconcerting one. On the one hand, Lady Heyburn had urged him to leave the Riviera, without giving him any reason, and on the other, he had the ever-present danger of Gabrielle, in a sudden fit of sentimental self-sacrifice, 'giving him away.' If she did, what then? The mere suggestion caused him to bite his nether lip.

Krail knew a good deal, but he did not know all. Perhaps it was as well that he did not. There is a code of honour among adventurers all the world over; but few of them can resist the practice of blackmail when they chance to fall upon evil days.

'Yes,' Flockart said reflectively, as at Krail's suggestion they turned and began to descend the steep hill towards Ospedaletti, 'perhaps it's a pity, after all, that the girl left Glencardine. Yet surely she's safer with her aunt?'

'She was driven from Glencardine?'

'By her father.'

'You sacrificed her in order to save yourself. That was but natural. It's a pity, however, you didn't take my advice.'

'I suggested it to Lady Heyburn. But she would have nothing to do with it. She declared that such a course was far too dangerous.'

'Dangerous!' echoed the shabby man. 'Surely it could not have placed either of you in any greater danger than you are in already?'

'She didn't like it.'

'Few people do,' laughed the other. 'But, depend upon it, it's the only way. She wouldn't, at any rate, have had an opportunity of telling the truth.'

Flockart pulled a wry face, and after a silence of a few moments said, 'Don't let us discuss that. We fully considered all the pros and cons at the time.'

'Her ladyship is growing scrupulously honest of late,' sneered his companion. 'She'll try to get rid of you very soon, I expect.'

This latter sentence was more full of meaning than the speaker dreamed. The words, falling upon Flockart's ears, caused him to wince. Was her ladyship really trying to rid herself of his influence? He laughed within himself at the thought of her endeavouring to release herself from the bond. For her he had never, at any moment, entertained either admiration or affection. Their association had always been purely one of business—business, be it said, in which he made the profits and she the losses.

'It would hardly be an easy matter for her,' replied the easy-going, audacious adventurer.

'She seems to be very popular up at Glencardine,' remarked the foreigner, 'because she's extravagant and spends money in the neighbourhood, I suppose. But the people in Auchterarder village criticise her treatment of Gabrielle. They hear gossip from the servants, I expect.'

'They should know of the girl's treatment of her stepmother,' exclaimed Flockart. 'But there, villagers are always prone to listen to and embroider any stories concerning the private life of the gentry. It's just the same in Scotland as in any other country in the world.

'Ah!' continued Flockart, 'in Scotland the old families are gradually decaying, and their estates are falling into the hands of blatant parvenus. Counter-jumpers stalk deer nowadays, and city clerks on their holidays shoot over peers' preserves. The humble Scot sees it all with regret, because he has no real liking for this latter-day invasion by the newly-rich English. Cotton-spinners from Lancashire buy deer-forests, and soap-boilers from Limehouse purchase castles with family portraits and ghosts complete.'

'Ah! speaking of the supernatural,' exclaimed Krail suddenly, 'do you know I had a most extraordinary and weird experience when at Glencardine about three weeks ago. I actually heard the Whispers!'

Flockart stared hard at the man at his side, and, laughing outright, said, 'Well, that's the best joke I've heard to-day. You, of all men, to be taken in by a mere superstition!'

'But, my dear friend, I heard them,' said Krail. 'I swear I actually heard them! And I—well, I admit to you, even though you may laugh at me for being a superstitious fool—I somehow anticipate that something uncanny is about to happen to me.'

'You're going to die, like all the rest of them, I suppose,' laughed his friend as they descended the dusty, winding road that led to the palm-lined promenade of the quiet little Mediterranean watering-place.

(To be continued.)

LOOKING BACK ON THE BUSH.

By WILL H. OGILVIE.

THE Bush, with its wonderful charm and its wonderful mystery, half-repellent, half-attracting, can only adequately be summed up and appreciated when viewed from a distance. We who have fought and suffered and enjoyed, toiled and loved and hated, at her side can only, perhaps, properly estimate our reasons of like and dislike when half-a-dozen years and as many tossing seas lie between us and the land in which we spent our early manhood. As we look backward in the sober light of middle age, much of the glamour which enthralled us is removed, and at the same time much of that which we found irksome and commonplace we can appreciate as of national and individual benefit. The busy, crowded life of the sheep and cattle stations, the humdrum but altogether necessary business-life of the up-country townships, become to us now, as we calmly review them, factors in the existence of a country's dawning power instead of merely incidents in the personal career of gay and thoughtless youth, with its own pleasure to serve and its own selfish ends to attain. The Bush is more than the play-ground of the jackaroo; it is the rich demesne of a Commonwealth. Surveying the position dis-passionately and fairly, we can remember what a school and what a training-ground was that vast inland territory, with its peculiar war of the elements, its raids of flood and fire, its rapine of the drought. We can remember how, through the apparent self-advancement of capital, shone the real gold of a gallant and self-sacrificing brother-hood. If the Bush was a harbour of petty meannesses and sordid vices, it was also full of the manliness, courage, and generosity that are in all lands the distinguishing characteristic of the men of the outposts; and, looking backward from the very different surroundings of an old land fenced with tradition and sown with precedent, the writer appreciates the memory of a social and industrial freedom that, if it caused him often to rub shoulders with the reckless and the undesirable, allowed him at the same time proudly to shake the hands of men whose equal is not in the wide world in resource, in endurance, and in sterling kindliness of heart.

And so calmly, honestly, and without prejudice let us consider some of the faults and foibles which hot youth overlooked, and some of the grander qualities which only mature reflection can fully appreciate.

In a general way, the word Bush recalls to the writer, as it will recall to most of his readers, first of all the strenuous days of station-life, the long war with nature's indomitable forces, the sun and dust and saddle-weariness of the great gray inland plains. Day followed day so quickly then, we stood so near our constant toil, our occasional revelry, that our eyes were dimmed to the perspective of the labour we achieved and the substance that we wasted; but now we can see, holding up that period to the mirror of our hearts, that, if our play was often a very riot of wantonness, our work was sincere and good. However, as we glance again at the details which the intervening years limn so clearly, we can recall, even in our honesty of labour, the crudity and defect of its method. And let us take as a matter of vital importance, because affecting in the end the strength of a nation and its power among others, the case of our treatment of the animals put under our charge. There was a great deal of unnecessary cruelty to horses, cattle, dogs, and sheep. No one expects or demands that, under the existing conditions, where flocks and herds are of such huge dimensions and the exigencies of climate so severe, the dumb animal of the Australian Bush can be handled with a velvet glove. Sheep must be hurried when the distance is long to the yards and the heat of the sun is gaining in intensity in each half-hour; cattle must be forced over their pace when, with water scarce, two days' stage is compressed into one, and the weak must keep up with the strong. Horses must often be ridden hard in the interests of humanity or live-stock. Dogs must follow their mounted masters over many waterless miles, oppressed by thirst and a semi-tropic sun. But at the same time one can look back to a thousand acts of cruelty, wilful or careless, which could surely have been avoided. The worst of these was the riding of horses with saddle-sores on their backs. So callous does the average bushman become to this particular phase of animal suffering that he will mount, morning after morning, a horse which will cringe almost to the ground as his weight strikes the stirrup; and though the owners and managers of the sheep and cattle runs are more to be blamed than the men who ride to their orders, still it is notorious that scarcely a protest is made against a barbarous practice that is now generally sanctioned by custom.

With little acts of cruelty to driven and yarded sheep one might fill a volume. Granted that the sheep is possibly the most exasperating and temper-trying animal in the world, and that the bushman frequently meets it under circumstances of place and weather calculated to try the patience of the angels, the fact remains that it is often treated in a manner at variance with all Christian teaching and all humane principle. One can remember how, in the height of summer, the large flocks were dogged across the dusty paddocks; how the laggards and weaklings who lay down from exhaustion were flogged up with stock-whips and compelled to stagger

a yard or two at a time in the wake of the stronger thousands; how young lambs, panting and distressed, were harshly hurried forward, or when unfit to travel farther callously dashed to their death against the stems of trees or the posts of fences. One remembers, too, the dusty sheepyards, where the poor, unresisting beasts were harried and crushed and poked with sticks into the drafting-race; the shearing-shed, where they were roughly handled and often brutally bladed under the shears; the dipping-pens, where the old ewes, bitterly resenting the indignity, were flung headlong into the foaming dip or beaten unmercifully with sticks for again and again turning back from the ordeal that they feared.

The cruelty to dogs was for the most part rather careless than wilful. The average bushman seemed utterly unable to estimate at its true value the worth of these gallant little comrades who followed us so uncomplainingly in our daily work. Many and many a time a little thought on their account might have saved them endless suffering as they toiled to keep up with us in the scorching noons, on sore and blistered feet, with dry tongues lolling. There was much cruelty, too, in droving. Both horses and dogs, as well as the driven stock, were often inhumanly starved where the expenditure of a few shillings might have secured them food. Summing up, judicially and impartially, on memory's reliable evidence, there is but one conclusion at which we arrive, and that is that the average bushman, than whom no man in the world is more dependent on the help of his dog and horse, treats the animals under his care with a scant consideration bordering on absolute inhumanity. To this rule one remembers the inevitable exceptions, men of tender feeling and close sympathy with the creatures in their care; but the Bush, alas! was full of the heartlessness that hunted the harmless kangaroo merely for love of killing, and left the swamp-bound bullock to his fate.

It is impossible to look back on the Bush without recalling the carelessness and indifference to home-comforts which were displayed in the humbler dwelling-places of the selectors, farmers, and hotel-keepers. This may have been a remnant of the pioneer spirit which was satisfied with very little in the way of personal comfort; but it would seem to have been due rather to a national—or, perhaps one should say, a local—indolence which discouraged attention to the generally accepted amenities of home-life. Even in the squatters' houses, in the managers' quarters, and in the jackaroos' barracks we lived simply, indeed one might say in almost Spartan frugality. In the slab huts of the selectors and in the weather-board shanties of the Bush publicans this simplicity was accentuated into bareness, and very often, be it said, into squalor. The writer has again and again stood amazed on the threshold of these neglected homes, amazed at the utter absence of endeavour to impart even a semblance of cheeriness or comfort to rooms that held the barest necessities of life. Well-to-do farmers and selectors, and their wives, seemed to be quite satisfied to exist in a condition of untidiness and discomfort which would have galled even the farm-labourer of Great Britain, whose tastes cannot be called extravagant, but who yet manages to make the humblest cottage take the appearance of a home. It must often have been a source of wonder and of not a little amusement to the visitor to the Bush—as it has frequently been to the present writer—to see a quite ambitiously dressed man or woman emerge from the veriest hovel of a home, produce from a tumble-down shed of a stable a magnificent horse with a valuable saddle on him, and ride gaily away to town, giving an impression of wealth and luxury on the road which was scarcely borne out by the appearance of the domicile left but a moment before.

The Bush hotels, which in all reason should have been made as attractive as possible to the traveller, were with few exceptions shanties of the poorest description. No owner seemed to find it either politic or pleasant to keep his house tidy. A dusty, unswept veranda led into a grimy and beer-stained bar-room, with a floor unspeakably dirty and benches that knew not the scent of soap or the saving influence of water. A slatternly Hebe or an unshaven Ganymede ministered to the wants of the traveller, and in no way helped to remove the impression of slovenliness already gathered from the house. In the townships the hotels were necessarily kept in better order, and even some of the Bush shanties aimed at cleanliness; but in the mirror of memory one sees mostly the dirty bar-room, the fly-ridden parlour, and the draggled helpers.

The squalor and sordidness of some of the selectors' houses can never be forgotten. The writer recalls one at the moment: a rather secluded habitation in the Bogan scrub, and not a hundred miles from Dubbo, to which he had gone to inquire of the owner in the matter of a horse. A down-trodden, hopeless-looking woman, of the type which Henry Lawson with a touch of genius has depicted so well in his *Past Carin'*, came to the door in answer to a knock. The utter weariness of her walk, of her gesture, of her speech, no man possessing a heart could ever forget. If the children in the great, bare, barn-like room were all hers she was the possessor of eight, one of them a baby of only a few months old, and the eldest no more than a child. In addition to this, the woman was soon again about to be a mother. While we were waiting for a few moments for the husband's return, there was opportunity to study in detail the one sordid room that was home to the miserable occupants that it contained. There was no vestige of ornament on table or walls, no suggestion of carpet or floorcloth, no furniture but the rough bush-table and the up-turned soap-boxes which served as chairs. The remains, or beginnings perhaps, of the midday meal stood upon the table, and flies innumerable crawled over the sodden damper and a dish of

almost liquid butter. The baby lay in a box in one corner of the room, with the flies feeding in the corners of its helpless eyes, poor, pitiful little mite! What need of it in this great, hard world? And, oh, what hope for it? The other children, dirty and half-naked, stood about the room in attitudes of pathetic resignation and indifference. They took no interest in the stranger, no interest in the baby, no interest apparently in life. One of their number, aged seven or eight, a boy, stood staring vacantly past us into the gray solitude of the Bush. His eyes were lustreless and dull, his gestures merely mechanical; his face was that of an idiot. The woman turned and stumbled against him; angry, she cuffed him heavily, and he fell against the table. He was the pariah, the superfluous, the undesired. What end for him? What fate? The haunting image of his face no years have been able to destroy. The lord and master of this dirty hovel, of this draggled, child-bearing machine, of those dull and idiot children, was a short, thick-set man of quarrelsome disposition and doubtful reputation; a man whom you might find, well-dressed and gaily mannered, in the bars of the neighbouring township, gambling, drinking, and talking of horses to congenial companions, while a big-boned blood-hack clicked his snaffle-bars and pawed the gravel outside. Looking back on such scenes of squalor and wretchedness, one realises now in the true perspective of time how near to us was the carelessness and social criminality of a home-life which in its way vied with the sordid conditions of life in Whitechapel or Shoreditch. That we scarcely realised this to the full in those busy days of our youth is no less true than regrettable. From such homes as these were sent forth the idle and half-witted creatures so often found among the sheep-stations or loafing on the verandas of the township hotels, a slur on Bush-life and a menace to national development.

One finds one's self, in recalling the wilder aspects of life up-country, continually asking the question: was drunkenness prevalent among the bushmen? No man can go through the ordinary routine of existence in the less settled parts of Australia without being brought into contact with a great deal of hard drinking. Every one who knows the Bush knows its reckless revelry, the barefaced invitation and robbery of its wayside shanties, and its accepted custom of 'knocking down' or 'blewing' its hard-won cheques. At first the visitor receives this state of affairs with loathing and horror; later he becomes inured to it; still later, perhaps, accepts it, as the Australian does, as inevitable and pardonable.

There is much in the mode of life of the bushman to excuse these lapses from virtue. The climate is a trying one, the ofttimes loneliness of the stockman's or boundary-rider's life wakes in him a not unnatural craving for those periods when he can join in the company of other men, and such companionship only too frequently leads to the drinking-bout. The shearer toils for many weeks with almost supernatural energy; what wonder that he relaxes under the easeful, if not too pleasant, surroundings of the first-found Bush hotel? The stockman, dry-throated all the week in the dust of the sheepyards or of the cattle-camps, finds strong temptation in the lighted bars of the township on Saturday nights. Try first of all his strenuous labour before you condemn his occasional lapses! The dam-sinker and the fencer sweat alone through the summer noons at a giant's task; if they gamble and drink when the sun goes down, who shall fling at them the first stone? Looking back on it all, cause and effect, condemnation and excuse, one is bound to defend the reputation of the average bushman. The true bar-room loafer is there; but he is whole-heartedly despised; nor does he escape notice in the Bush as he too often does in the town. A fondness of wine is condoned in the stalwart, honest worker. 'Hard drinker, hard grafter,' is an accepted motto among the bushmen. The clean bush-air soon revives and reinvigorates the strong and elastic constitutions of the clean-bred western men. The climate may tempt them to excess, but the climate finds them strength to withstand its effects. Looking back impartially on those who indulged in desperate orgy and those who avoided liquor as they would avoid poison, one comes to the conclusion that the Bush is less drunken than the world supposes, and much more sober than its mode of life would suggest; but it must be remembered that when the bushman does drink he drinks as he toils—like a giant—almost splendid in his broad-shouldered Bacchanalian abandon.

Bush horsemanship has been much discussed and commented on, and there is a general tendency to enlarge upon the bushman's prowess in the saddle. Looking back without prejudice, one knows that this prowess was much exaggerated; it is one of the mistaken ideas constantly entertained in connection with the Australian Bush, and should be relegated to the same platform as the red-shirted bushman, the bloodthirsty, spear-armed blackfellow, and the ubiquitous but gentlemanly bushranger. Among the stockmen, especially on the cattle-stations of Queensland, may be found a few riders who can hold their own with any horsemen in the world. But on the sheep-stations of New South Wales, when one considers the practice which these men enjoy, their lack of courage and lack of skill were very noticeable. The average sheep-station could boast, perhaps, of one first-rate horseman and a couple of plucky youths, either British jackaroos or Australian natives, who were ready and willing to risk their necks on young horses or those of doubtful reputation; but the boundary-riders as a rule were arrant cowards, and though brought up from babyhood among horses apparently were never at home with them. Any one who has lived on a western sheep-station will remember the excitement and fuss made over the mounting of a fresh young horse which was expected to give a few plunges. All sorts of quiet and inoffensive animals which

played up at all when the girths pinched them on a cold morning were labelled 'buck-jumpers' and 'outlaws,' and were generally speaking left severely alone. Considering that the bushmen made their living on horseback, and took all their pleasures in the saddle, the poorness of their horsemanship was a thing to be remarked. The young jackeroo from England, Scotland, or Ireland, with but small experience of horses, and then only of quiet and well-broken hunters, hacks, and ponies, found on arriving in the Bush that he could hold his own with men who had been literally swaddled in saddle-cloths. This seems to discount the courage of the bushman, but it is undoubtedly true. Looking back calmly and judicially on the comrades who rode daily at our bridle-hand at camp and muster, we are bound to assert that their horsemanship was far from being a subject for praise, considering the opportunities that their surroundings gave them; nor did they impress one, as a rule, with their pluck in this connection. There were, however, many notable exceptions, and the bush-rider at his best was a person worth going far to see.

Of the better class of bushman, as a man and as a comrade, it is always pleasant to write. His wonderful stamina and endurance, his dogged persistence and pluck under the repeated blows of adverse fortune, were points which all who knew him must remember. His loyalty to a just employer, his appreciation of honour and 'straightness' in the men with whom he dealt, were very real and deep-rooted. Of his wonderful, large-hearted helpfulness to his neighbours in time of trouble a book of many chapters could be written. We all of us who know the outpost-life know something of the men who have ridden the Bush for twenty hours at a stretch to search for a neighbour's lost child; who have toiled all day, stripped to the waist, sweat-grimed and smoke-blackened, beating out with green boughs or wet bags the burning acres of a neighbour's crop; who have given to that neighbour a dozen bags of wheat from their own scanty store to make up his loss, and have told no word of it to the world; who have plunged through the storm and darkness of the Bush nights to bring the doctor to some helpless friend. These men we met, and we fully appreciated their worth at the time, or thought we did. Looking back now, we realise that there was more of heroism there than even our young blood guessed; no lapse of time can dim the lustre of those kindly acts, and the brotherliness of them gathers grandeur with the years.

Of the Bush itself, considered as an expanse of ridge and plain, of burning grass and flooded creek, of dark, mysterious scrub, or weird and ring-barked river-flat, what shall we say? Is it beautiful, witching, caressing, as its poets sing; or fierce, cruel, repellent, as its enemies allege? The writer is fain to confess that, even after many years, these questions, so far as he is concerned, are still unanswered.

A VISIT TO ELBA.

By A. Francis Steuart.

NAPOLEON, the Man of Destiny, was granted Elba by the Treaty of Paris of April 11, 1814, and arrived in sight of his new kingdom in the Tyrrhenian Sea in a British ship on 3rd May. Although his removal to Elba is generally written of as an 'exile,' his relegation there cannot rightly be so styled. When he abdicated at Fontainebleau the magnificent position he had attained as Emperor of the French, he by no means relapsed into ordinary citizenship. He reserved for himself instead the sovereignty of the island of Elba (since 1802 a French dependency), and after a very troublous and dangerous passage through the south of France, where he found the people inflamed against a fallen idol, he embarked, under the protection of his former enemies, at Fréjus, to take possession of his new dominion.

He addressed the following letter to the French Governor of Portoferraio, the capital of Elba, in which his position is exactly defined:

'Circumstances having induced me to renounce the throne of France, sacrificing my rights to the common good, I have retained the sovereignty and dominion of the island of Elba. All the Powers have signified their assent to this arrangement. I send General Druot to you to take possession of the island, of the military magazines and stores, and of all that belongs to my imperial domain. The inhabitants will be the object of my careful solicitude.'

It is strange how little Elba is connected in the popular mind with the legends of the Napoleonic cycle, and yet the Emperor was king there for eleven months, and during that time, in spite of living in constant fear of being kidnapped by Barbary pirates or the hostile Powers, or assassinated by private enemies, he absolutely changed the character of the island. Most of what is worth seeing there now owes something to him, and had he not 'escaped,' and had been content to remain, Elba might have played a much greater part in history. As it was, Napoleon made it famous, and under his flag it was freed from depredations of pirates and from foreign domination.

Fired by descriptions of the beauty of Elba, well merited as it turned out, my sister and I greatly desired to visit the island when in Tuscany a year ago; but it proved to be easier to form the wish than to carry it out. We went to Leghorn as the port of departure, whence there is at least one boat a week; but when we arrived we found the boat had just started, and we were left to lament its departure

for another seven days! A happy idea came to our aid, and the next day we went on to the small trading-town of Piombino by train. This town is little visited, though a place of growing commercial importance. First an old fortress of the Orsini, then a principality of the Buoncompagni-Ludovisi, the former overlords of Elba, it is now best known as the place to which the immense mineral riches of Elba (iron and limestone) first arrive, and from whence they are conveyed all over Italy. A small steamboat leaves Piombino with the mails thrice daily for Elba, and in this steamer we decided to embark. Even then our troubles were not over. It is necessary to leave Piombino in small boats, as there is no pier, and, as luck would have it, the weather when we left was fearfully rough. A chorus of vociferous Italian men and screaming peasant women accompanied us, moreover, and one of the latter clasped my sister to her heart and prayed that she might protect her from the waves!

The rough crossing, however, was beautiful, and the first halt was at Cavo, on the east side of Elba, which is used as the port from which to convey passengers to the mining centres of Rio Marina and Porto Longone. Thence we sailed round the rocky coast of the mountainous island (seeing the peak of the magnetic mountain Monte Calamita, formerly so much feared by mariners), and in less than two hours came into the harbour of Portoferraio. This, Napoleon's capital, is a Tuscan town, built with innumerable arcades round a beautiful circular bay, now disfigured on its fringe by works for smelting the staple iron ore, and shadowed by the lofty peaks of the distant hills of Marciana. It is, if small, a perfect fortified harbour, and is very picturesquely dominated by the high moated fort which was built in 1548 by Cosimo de' Medici. He founded the town (to which he had no right, though he called it 'Cosmopolis,' as the island then belonged to the Arragonese family of Appiano), and built it after the models of the older town of his duchy of Tuscany.

Our first steps were directed to the Hotel del Ape Elbana (called 'the Bee of Elba' after Napoleon's white Elban flag, on which was an orange stripe charged with three Bonaparte Bees), where the handsome Italian *padrona* gave us (after some bargaining) excellent hospitality. Portoferraio contains two level squares, now called after King Victor Emmanuel and Cavour, and the rest is a pyramidical medley of picturesque staircases and arched windows, making the town something like a miniature Genoa. The Hotel de Ville exhibits tablets to Mazzini, Guerrazzi (who wrote some of his poems when a political prisoner in Elba), and Victor Hugo, who gained health in the town as a child. The population, including the miserable convicts in prison in the Bagno Penale in the harbour, is almost entirely Italian, and one sees on signboards the historic names of 'Della Borgia, jeweller,' and 'Giordano Bruno' as the keeper of an *osteria*.

We, keen to see where Napoleon resided, went soon to the Palace of the Mulini, now known officially as the Casa Reale, though the old name, derived from the flour-mills (*mulini*), from which the Emperor constructed it, still adheres. It is now a rather dilapidated building, with green shutters, and cannon-balls on the gate-posts, and at present is partly used by the artillery. It is built on the highest part of the city, at the top of many inclined planes and various staircases, and, though now unfurnished, has a garden with a magnificent view of the surrounding sea and the Piombino coast of the *continente*.

A kind Scottish engineer and his amiable French colleague helpfully befriended us the next morning, and not only made our way smooth, but also introduced us to the head of the schools in Elba and other Italians. With our two *ciceroni* we were lucky enough to drive out to Napoleon's summer villa, San Martino, about three miles from Portoferraio. This 'palace' is redolent of the king in exile. It was, unlike the Mulini, built by and for him, and bears many traces of his short occupation. The approach is altered since the Emperor's day, for in front of the unpretentious if royal villa the Russian, Anatole Demidoff, Prince de San Donato (who married Princess Mathilde Bonaparte, Napoleon's niece), built a fine Museo Napoleonico, with an entrance guarded by bronze gates embellished with Imperial Eagles, and also constructed fine gardens full of roses and scented shrubs. One regrets that he did so, not because the few Napoleonic relics (proclamations, &c.) in the museum are not interesting, but because by doing so he altered the character of the original small house and its own little garden. At the time he built this villa Napoleon, then in his first reverie of defeat, still expected his wife, Marie Louise of Austria, to come, with their son, to share his exile; and to show her that she was not forgotten, the ceiling of his *salon* was decorated with garlands of flowers encircling two doves tying a ribbon in a lovers' knot. The Napoleonic Bee and the star of the Legion of Honour form the decoration of another room, while the hieroglyphic paintings of the Salle d'Égypte were intended to remind the Emperor's miniature Court of his past doings in the land of the Nile. The bathroom has a painting of a figure of Truth, a quality for which the Emperor had a high regard, 'however little,' as a biographer remarks, 'he practised it himself.' In this little two-story villa Napoleon stayed, and there he was joined, not by the Empress as he hoped, but by his mother, the austere Corsican 'Madame Mère,' Letizia Ramolino, and his beautiful sister, Pauline, Princess Borghese. His mistress, the charming and gentle Pole, Madame de Walewska, also joined him in Elba when she found the Empress did not come, and brought her son; but, arriving at Portoferraio, and being mistaken there by the officials for the Empress, was hurried away in a severe storm from Marciana in the mountains after a tearful interview with the Emperor, who felt that he must

renounce all illicit ties while the eyes of Europe were upon him in exile.

Marciana Alta is the only retreat of the Emperor which we did not see. It is on the high hills to the west of the capital, and from it one can distinguish the white houses of Bastia in Corsica. There is a legend in Elba that the Emperor used to signal from another mountain (pointed out to us) to his native land of Corsica by a *signale di fuoco* (beacon) during his brief reign over the neighbouring island.

And he knew his occupation would be brief. Even if it was true, as he said, that the Powers had offered him his native Corsica, he had refused it and chosen Elba. He knew—no one better—that Elba suited him best as a 'no man's land.' First Roman, and fortified by the Romans with forts still existing, then conquered by the Saracens and African Moors, it had become Pisan, Genoese, Spanish, and Italian in turn, and in 1799 (*faute de mieux*) French. It was always a likely prey to the British (a fort near its capital is called 'Fort Inglese' to this day), or to the Barbary pirates who ravaged its coasts. The British, indeed, had a spy on the Emperor in the person of Colonel (Sir Neil) Campbell, the 'commissioner' who was attached to the Court of Napoleon and represented his relations with the Powers of Europe. In spite of all this, Napoleon's energy was extraordinary. He forced the Elbans to make roads. He made them—no easy task—cleanse Portoferraio. He got up plays 'to amuse my mother and Paula,' and founded (in a church) a theatre which still exists—a tiny little doll's house of a theatre, packed with four rows of little boxes. He 'conquered' and fortified two islands—the fertile Pianosa and the rock of Palmaiola, which were claimed by no other Power. He taught the islanders to plant mulberries, to plough, to grow potatoes, to make strides in mining (the industry has increased enormously since his time, to the disfigurement of the island). He improved the fisheries, founded hospitals, a library, and a military school, and in any way he could encouraged Elban culture. This state of things was too good to last, however; the subsidy agreed to by France was not paid by the restored Bourbons to the Emperor, and he, to keep up his mimic Court and very real though small army, had to exact money from his unwilling Elban subjects. At last, during the absence in Italy of Colonel Campbell, the commissioner, he and his suite, headed by the faithful General Bertrand, who left his Irish wife (*née* Dillon) to follow the Emperor, stole away on April 26, 1815, from Elba in his little fleet which had been secretly prepared. Landing in France, Napoleon rallied his forces round him during the glorious 'hundred days' which for him ended in Waterloo and St Helena.

Napoleon is always a fascinating figure, but I am not at all sure that one does not realise this most at Elba. In spite of his many illegal acts, his glory completely won over the unwilling Elban people to whom he so suddenly came as their 'king.' He knew their country (like his own Corsica maybe) and its productions, and he knew, notwithstanding his shadowy Court and real taxes, how to gain their affections. They still pay reverence to the 'Testa di Napoleone,' a bronze cast of his head (taken by Dr Antommarchi at St Helena) which Prince Demidoff presented to the Church of the Blessed Sacrament, in the possession of the 'Black' Misericordia. One looks upon the beautiful bronze profile in the black coffin with a real thrill, as it presents to one's eyes the features of the best benefactor Elba ever had, and the only independent king that island, given over to ruthless conquerors from time immemorial, has ever known.

The society at the 'Ape Elbana' was very cosmopolitan; not only were our new Scottish and French acquaintances there, but there was an Italian table for men connected with the mining industry, and a coterie of Germans as well. One scientist, a Viennese-Italian, was there also, who had spent two months at Marciana collecting the island snails and other 'land molluscs,' on whose habits he waxed eloquent. The hotel was native but good, if one avoided foreign luxuries like '*Bischtekke*' and confined one's self to ordering Italian dishes (including raw pea-pods) and native wines. We left on the third day, and were overjoyed on our return voyage to have a magnificent view of the hills near Marciana, and the larger island of Corsica beyond, and then later of Pianosa, the island 'annexed' by Napoleon, and also of Monte Cristo, famed in story, before the little steamboat brought us back to the commerce of Piombino and the railway track to Leghorn.

POT-POURRI.

Love is like the roses,
  Fair and sweet in June,
When in garden closes
  Birds are all a-tune.
Pluck the flower, it grows for you,
Blushing 'neath its veil of dew.
Love is like the roses,
  Fair and sweet in June!

Love is like the roses—
  How the colour pales!
From the garden closes
  Gone the nightingales;
Dim the petals are, and dry:
Say not, rose, that love must die!
Love is like the roses—
  How the colour pales!

Love is like the roses!
  Still their fragrance stays,
Spite of leafless closes
  Through the winter days.
Rose-leaves in your china bowl—
Love still treasured in your soul!
Love is like the roses—
  Still its fragrance stays.

A DOG IN THE PULPIT.

By COULSON KERNAHAN,
Author of *God and the Ant, The Dumpling, An Author in the Territorial,* &c.

THOUGH we choose our own politics, we cannot always choose the company which our politics make it necessary for us to keep. I had promised to address a meeting in a certain village, and was informed by the organiser that, as there was no possibility of my getting back to town that night, Mr and Mrs H., prominent local supporters of the cause, would be pleased to afford me hospitality. Much public speaking about the country has long since convinced me that it is wiser to face the known discomforts of an inferior hotel than the unknown possibilities which may await one even in a princely private house. At the hotel a tired public speaker or lecturer is at least at liberty to please himself. In a private house he has to please and to consider his host and hostess, and is sometimes expected, in spite of tingling nerves and flagging energies, to talk brilliantly, and to entertain a large company when all his longings are set upon quiet and a pipe.

Hence I wrote to the local secretary, telling him, according to the formula I have adopted for such occasions, that circumstances so often render it necessary that I catch an early train in the morning after addressing a meeting, that I make it a rule to stay at hotels rather than at private houses, where an early breakfast and departure might inconvenience my hostess.

He replied hoping that I would see my way to be the guest of Mr and Mrs H.; and as, reading between the lines of his letter, I gathered that these worthy people are so good as to suppose that the chief speaker at a meeting is a person of importance —some measure of which is reflected upon his entertainers—and might take offence were I to refuse, I made no further to-do about the matter, but wrote accepting their invitation.

The result was not a success. Though the dinner, the wines, the flowers, and the silver were sumptuous, my host was offensively familiar, and the conversation of my hostess stilted and artificial. The talk consisted chiefly of scandal, which I abhor, if for no other reason than that one knows that the folk who scandalise their neighbours when in your own company will inevitably spread slanders abroad about yourself as soon as your back is turned. Bored and weary, I leaned back in my chair and let a listless hand drop to my side, when suddenly from somewhere under the table a wet nose snuggled itself affectionately against my fist, and the next moment a warm hairy wedge butted itself between my closed fingers.

It was the Irish terrier of the establishment. He had slipped into the room unseen; and after the flushed, assertive face of my host, the hard mouth, the gimlet eyes, lined and glittering, of my hostess, a look into the honest hazel dog-eyes that met mine so trustfully and truthfully seemed to straighten out my world for me, and I felt as one might feel who after groping his way among sliding quicksands finds firm ground under his feet again. Small wonder that a cynic once said that the more he saw of men and women the more he loved dogs and horses. As I thumped my dumb friend's shaggy and sounding sides, scratched at the ear that was cocked and inclined invitingly towards my hand, and nibbled as it were with my finger-tips at the close hair upon his pleased and insistent crown, the honesty of his undisguised happiness in being thus caressed, and the hard-drawn breathing which betokens a dog's enjoyment and gratitude just as surely as purring betokens a cat's, were—after the shams, scandalisings, and insincerities to which I had been listening—as refreshing as a breath of pure air in a fetid atmosphere. A dog—a dumb animal—had renewed faith and hope within me, and had made sweet and endurable a world of which, had it been peopled entirely by such folk as those in whose company I found myself, I was disposed to be sickened and despairing.

George Eliot says somewhere that many men are kinder to the very dumb animals of their household

[*All Rights Reserved.*]

than they are to the women who love them; and adds cruelly, 'Is it because the animals *are* dumb?' Fear of my own womenkind, to say nothing of Suffragettes, prevents me from attempting an answer to that question; but in regard to my dog I am by no means sure that he and I would get on any better could he answer back. When he and I fall out, when he misbehaves in some way and I have cause to punish him—and myself in doing so—and he turns a reproachful eye upon me, my anger passes. Sometimes even I am rebuked. Perhaps had he flung a reproachful word at me the feud between us might have been fed by a new fuel, and his and my wrath blazed anew. But that dumb, appealing look I cannot resist. It seems to say, 'What I have done amiss I do not know. If I did, I would try to mend it, for I love you, and have no wish but to please you. Perhaps sometimes you unintentionally displease *your* Master, God; but He is an easier Master than you, for He always knows His own mind, besides which He forgives you a great many worse sins and a great many more times than you ever forgive me. If you are sorry, you can say so in so many words, but I can't; and since neither to dog nor to master has been given the power to make known to the other his exact wishes in words, be as patient as you can with a poor little dog who is doing his poor little best.'

To me there is something pathetic in the thought of a dog's confidence in and dependence upon the whims and upon the care of a master by nature careless or forgetful. In their wild state, God's creatures can generally shift for themselves; but to prison a bird in a cage, to chain a dog to a kennel, or even to shut him in a room, and perhaps in the enjoyment of our own freedom, the pursuit of our own pleasure, or the following of our own convenience, to forget that the faithful fretting and pining of the dog for his master are making every moment that passes a tiny martyrdom, and that the bird is suffering the pangs of hunger or the tortures of thirst, is to be guilty of a cruelty not easily to be forgiven.

It is for this reason, perhaps, that I can never see a dog gnawing at a bone without some sense of pity. There is a certain rugged and noble independence in the fearless fending for themselves of wild beasts and birds in the open; and to see them devouring prey of their own hunting arouses in me no sense of pity other than for the quarry. Even the sight of innocent and harmless sheep or cattle browsing peacefully in a meadow—idyllic as is the picture they make, and destined as I may know them to be for the slaughter-house—does not appeal in so near and so intimate a way to me as does the sight of my dog, his whole length prone upon the ground, his outstretched forepaws clasped upon the bone as eagerly as a miser clutches his gold, and the very dog-soul of him as intent upon his task as if life itself depended upon his finding some shred of gristle, some morsel of meat, upon a knuckle-end that his teeth have already scraped and planed to the whiteness and cleanness of polished ivory. Perhaps it is that seeing him thus—his jaws distended to the point of dislocation in an impotent effort to compass the circumference of a huge shin-bone, or else making of the same jaws a pair of nut-crackers to scrunch wickedly at some marrow-end hard enough, one would think, to splinter every tooth in his head, reminds me of the way in which we human beings strain every nerve, break our hearts almost, to compass some trivial end, some twopenny triumph as barren of any ultimate result to ourselves or to others as the dog's gnawing and worrying of the meatless bone.

When my dog looks full at me, eagerly alive and alert to read by the signs of my face whether I am contemplating a walk or a romp, I am not conscious of this pathos of which I have spoken. But when, while he is busy with a bone, or while lying with head upon his paws by the fire, he turns upon me, upward or sideways and slowly, the white edge of a watchful eye, I am strangely reminded of the melancholy which one sees, or fancies one sees, in some Oriental face. The sadness of the East is there, either in reality or in my imagination. By ancestry he may be Scotch, and consequently he is by creed, I suppose, a Presbyterian; but I suspect sometimes that the breed came originally from Persia, for by conviction he is unquestionably a fire-worshipper. To say that he is a fire-fearing dog in the sense in which we speak of a God-fearing man sounds like profanity; but it is a fact that fire seems to inspire him not only with fear but with something like awe. The fear—he will stop dead-short, even as his jaws are in the act of closing upon a *bonne bouche*, to turn a sideway suspicious eye upon the fire—is easily explainable. But his awe comes perhaps of the fact that, looking at the fire, he may realise the existence of some Power outside himself, and outside his comprehension, about which he wonders as we mortals wonder about God, asking himself what manner of Power this can be which now invites him to creep nearer that he may comfort and cheer himself in its kindly warmth, and now strikes suddenly at him to blister and burn with falling coal or darting spark. If even to us men and women that ethereal, elusive, unsubstantial element which we call fire, and which so few of us, for all our science, really understand, is the acknowledged symbol of what is spiritual, and is constantly so used in the Scriptures, surely to a dog's intelligence fire must be even more awful and incomprehensible. Other live things—a bluebottle on a window-pane, a rat running along the road, an elephant in a circus, or a man sitting in a chair—have some relation to the dog's self. He can snap his jaws at the bluebottle, hunt down and kill the rat, bark at or run away from the elephant, and obey the man. But fire is something different from all these; it is life without body, and hence comes his fear and his awe. As he sits by the fender, his eye held by the fire as the eye of a fascinated bird is held by a serpent, I ask

myself of what it is he thinks. Into most of his self-communings I can follow him, but here I lose touch. As a child may flick a toy balloon, first to the right and then to the left, by the touch of a finger-tip, and then suddenly find the obedient slave and plaything elude the grasping finger like a live thing and be whirled aloft by the wind and out of sight, so, as my dog sits before the fire, his soul seems to slip the cable which bound him to me, and to lose itself in depths and distances whither I cannot track him. Perhaps, as he looks into that fire, the spirit of wonder which is at the root of all religion and all worship is awakening within him. Perhaps he is thinking such thoughts as arose in the soul of Moses when he gazed upon the burning bush, and knew it for the manifestation of God. Perhaps even his dog-soul dimly apprehends that I—who seem to be the arbiter and end of his being, and to whom is entrusted the power of life and of death—am after all only his master, not his maker; am only an animal, and mortal like himself, and so somewhere in his dog-soul awakens some dim idea of a God.

This is, of course, the idle and possibly foolish fancy of a dreamer; but of one thing I am at least certain, and that is if my dog knows, or at all events acknowledges, no higher power than I, I am in a sense God's deputy in regard to him. If, therefore, I do anything to soil or to destroy my dog's beautiful and sacred confidence in me, I am in act an atheist, a destroyer of trust, and am loosening the golden chain of love that it is God's will should bind and *shall* one day bind the whole creation—God to His creature man, man to his dumb friends and fellow-sharers of this wonderful gift of life—in the beautiful bonds of mutual confidence and love.

For that reason, in all my dealings with my dog I try to be honest and to be just. I make him no promise that I do not fulfil, and if I have reason to be angry with him or to punish him, I am wary and alert lest Temper snatch the whip out of the hand of Justice, and I fall under the reproof of good old Sir Thomas Browne, who said that he would give nothing for the Christianity of the man or woman whose very cat and dog were not the better for it.

THE HOUSE OF WHISPERS.

CHAPTER XXIV.—'WHEN GREEK MEETS GREEK.'

ON their left were several white villas, before which pink and scarlet geraniums ran riot, with spreading mimosas golden with their feathery blossom, for Ospedaletti makes a frantic, if vain, bid for popularity as a winter-resort. Its deadly dullness, however, is too well known to the habitué of the Riviera; and its casino, which never obtained a license, imparts to it the air of painful effort at gaiety.

'Well,' remarked the shabby man as they passed along and out upon the sea-road in the direction of Bordighera, 'I always looked upon what the people of Auchterarder said regarding the Whispers as a mere myth. But now, having heard them with my own ears, how can I have further doubt?'

'I've listened in the Castle ruins a good many times, my dear Krail,' replied the other, 'but I've never heard anything more exciting than an owl. Indeed, Lady Heyburn and I, when there was so much gossip about the strange noises some two years ago, set to work to investigate. We went there at least a dozen times, but without result; only both of us caught bad colds.'

'Well,' exclaimed Krail, 'I used to ridicule the weird stories I heard in the village about the Devil's Whisper, and all that. But by mere chance I happened to be at the spot one bright night, and I heard distinct whisperings, just as had been described to me. They gave me a very creepy feeling, I can assure you.'

'Bosh! Now, do you believe in ghosts, you man-of-the-world that you are, my dear Felix?'

'No. Most decidedly I don't.'

'Then what you've heard is only in imagination, depend upon it. The supernatural doesn't exist in Glencardine, that's quite certain,' declared Flockart. 'The fact is that there's so much tradition and legendary lore connected with the old place, and its early owners were such a set of bold and defiant robbers, that for generations the peasantry have held it in awe. Hence all sorts of weird and terrible stories have been invented and handed down, until the present age believes them to be based upon fact.'

'But, my dear friend, I actually heard the Whispers—heard them with my own ears,' Krail asserted. 'I happened to be about the place that night, trying to get a peep into the library, where Goslin and the old man were, I believe, busy at work. But the blinds fitted too closely, so that I couldn't see inside. The keeper and his men were, I knew, down in the village; therefore I took a stroll towards the ruins, and, as it was a beautiful night, I sat down in the courtyard to have a smoke. Then, of a sudden, I heard low voices quite distinctly. They startled me, for not until they fell upon my ears did I recall the stories told to me weeks before.'

'If Stewart or any of the under-keepers had found you prowling about the Castle grounds at that hour they might have asked you awkward questions,' remarked Flockart.

'Oh,' laughed the other, 'they all know me as a visitor to the village fond of walking exercise. I took very good care that they should all know me, so that as little explanation as possible

would be necessary. As you well know, the secret of all my successes is that I never leave anything to chance.'

'To go peeping about outside the house and trying to look in at lighted windows sounds a rather injudicious proceeding,' his companion declared.

'Not if proper precautions are taken, as I took them. I was weeks in that terribly dull Scotch village, but nobody suspected my real mission. I made quite a large circle of friends at the "Star," who all believed me to be a foreign ornithologist writing a book upon the birds of Scotland. Trust me to tell people a good story.'

'Well,' exclaimed Flockart after a long silence, 'those Whispers are certainly a mystery, more especially if you've actually heard them. On two or three occasions I've spoken to Sir Henry about them. He ridicules the idea, yet he admitted to me one evening that the voices had really been heard. I declared that the most remarkable fact was the sudden death of each person who had listened and heard them. It is a curious phenomenon, which certainly should be investigated.'

'The inference is that I, having listened to the ghostly voices, am doomed to a sudden and violent end,' remarked the shabby stranger quite gloomily.

Flockart laughed. 'Really, Felix, this is too funny!' he said. 'Fancy your taking notice of such old wives' fables! Why, my dear fellow, you've got many years of constant activity before you yet. You must return to Paris in the morning, and watch in patience.'

'I have watched, but discovered nothing.'

'Perhaps I'll come and assist you; most probably I shall.'

'No, don't! As soon as you leave San Remo Sir Henry will know, and he might suspect.'

'Suspect what?'

'That you are in search of the truth, and of fortune in consequence.'

'He believes in me. Only the other day I had a letter from him written in Goslin's hand, repeating the confidence he reposes in me.'

'Exactly. You must remain down here for the present.'

Flockart recollected the puzzling decision of Lady Heyburn, and remained silent.

'Our chief peril is still the one which has faced us all along,' went on the man in the gray hat—'the peril that the girl may tell about that awkward affair at Chantilly.'

'She dare not,' Flockart assured him quickly.

Krail shook his head dubiously. 'She's leading a lonely life. Her heart is broken, and she believes herself, as every other young girl does, to be without a future. Therefore, she's brooding over it. One never knows in such cases when a girl may fling all prudence to the winds,' he said. 'If she did, then nothing could save us.'

'That's just what her ladyship said the other day,' answered Flockart, tossing away his cigarette. 'But you don't know that I hold her irrevocably. She dare not say a single word. If she dare, why did she not tell the truth about the safe?'

'Probably because it was all too sudden. She now finds life in that dismal little village intolerable. She's a girl of spirit, you know, and has always been used to luxury and freedom. To live with an old woman in a country cottage away from all her friends must be maddening. No, my dear James, in this you've acted most injudiciously. You were devoid of your usual foresight. Depend upon it, a very serious danger threatens. She will speak.'

'I tell you she dare not. Rest your mind assured.'

'She will.'

'*She shall not!*'

'How, pray, can you close her mouth?' asked the foreigner.

Flockart's eyes met his. In them was a curious expression, almost a glitter.

Krail understood. He shrugged his shoulders, but uttered no word. His gesture was, however, that of one unconvinced. Adventurer as he was, ingenious and unscrupulous, he lived from hand to mouth. Sometimes he made a big *coup* and placed himself in funds. But following such an event he was open-handed and generous to his friends, extravagant in his expenditure, and very soon found himself under the necessity to exercise his wits in order to obtain the next louis. He had known Flockart for years as one of his own class. They had first met long ago on board a Castle liner homeward bound from Capetown, where both found themselves playing a crooked game. A friendship begotten of dishonesty had sprung up between them, and in consequence they had thrown in their lot together more than once with considerable financial advantage.

The present affair was, however, not much to Krail's liking, and this he had more than once told his friend. It was quite possible that if they could discover the mysterious source of this blind man's wealth they might, by judiciously levying blackmail through a third party, secure a very handsome income which he was to share with Flockart and her ladyship.

The last-named Krail had always admitted to be one of the cleverest women he had ever met. His only surprise had been that she, as Sir Henry's wife, was unable to get at the facts which were so cleverly withheld. It only showed, however, that the Baronet, though deprived of eyesight, was even more clever than the unscrupulous woman he had so foolishly married.

Krail held Lady Heyburn in distinct distrust. He had once had dealings with her which had turned out the reverse of satisfactory. Instinctively he knew that, in order to save herself, if exposure ever came, she would 'give him away' without the least compunction.

What had puzzled him for several years, and what, indeed, had puzzled other people, was the reason of the close friendship between Flockart and

the Baronet's wife. It was certainly not affection. He knew Flockart intimately, and had knowledge of his private affairs; therefore he was well aware of the existence of an unknown and rather insignificant woman to whom he was in secret devoted.

No; the bond between the pair was an entirely mysterious one. He knew that on more than one occasion, when Flockart's demands for money had been a little too frequent, she had resisted and attempted to withdraw from further association with him. Yet by a single word, or even a look, he could compel her to disgorge the funds he needed, for she had even handed him some of her trinkets to pawn until she could obtain further funds from Sir Henry to redeem them.

As they walked together along the white Corniche Road, their faces set towards the gorgeous southern afterglow, while the waves lapped lazily on the gray rocks, all these puzzling thoughts recurred to Krail.

'Lady Heyburn seems still to remain your very devoted friend,' he remarked at last with a meaning smile. 'I see from the *New York Herald* what pleasant parties she gives, and how she is the heart and soul of social merriment in San Remo. By Jove, James! you're a lucky man to possess such a popular hostess as friend.'

'Yes,' laughed Flockart, 'Winnie is a regular pal. Without her I should have been broken long ago. But she's always ready to help me along.'

'People have already remarked upon your remarkable friendship,' said his friend, 'and many ill-natured allegations have been made.'

'Oh yes, I'm quite well aware of that, my dear fellow. It has pained me more than enough. You yourself know that, as far as affection goes, I've never in my life entertained a spark of it for Winnie. We were children together, and have been friends always.'

'Quite so!' exclaimed Krail, smiling. 'That's a pretty good story to tell the world. But there's a point where mere friendship must break, you know.'

'What do you mean?' asked the other, glancing at him in surprise.

'Well, the story you tell other people may be picturesque and romantic, but with me it's just a trifle weak. Lady Heyburn doesn't give her pearls to be pawned out of mere friendship, you know.'

Flockart was silent. He knew too well that the man walking at his side was as clever an intriguer and as bold an adventurer as had ever moved up and down Europe 'working the game' in search of pigeons to pluck. His shabbiness was assumed. He had alighted at Bordighera station from the *rapide* from Paris, spent the night at a third-rate hotel in order not to be recognised at the Angst or any of the smarter houses, and had met him by appointment to explain the present situation. His remarks, however, were the reverse of reassuring. What did he suspect?

'I don't quite follow you, Krail,' Flockart said.

'I meant to imply that if friendship only links you with Lady Heyburn, the chain may quite easily snap,' he remarked.

He looked at his friend, much puzzled. He could see no point in that observation.

Krail read what was passing in the other's mind, and added, 'I know, *mon cher ami*, that affection from her ladyship is entirely out of the question. The gossips are liars. And'——

'Sir Henry himself is quite aware of that. I have already spoken quite plainly and openly to him, and suggested my departure from Glencardine on account of ill-natured remarks by her ladyship's enemies. But he would not hear of my leaving, and pressed me to remain.'

Krail looked at him in blank surprise. 'Well,' he said, 'if you've been bold enough to do this in face of the gossip, then you're a much cleverer man than ever I took you to be.'

For answer, Flockart took some letters from his breast-pocket, selected one written in a foreign hand, and gave it to Krail to read. It was from the hermit of Glencardine, written at his dictation by Monsieur Goslin, and was couched in the warmest and most confidential terms.

'Look here, James,' exclaimed the shabby man, handing back the letter, 'I'm going to be perfectly frank with you. Tell me if I speak the truth or if I lie. It is neither affection nor friendship which links your life with that woman's. Am I right?'

Flockart did not answer for some moments. His eyes were cast upon the ground. 'Yes, Krail,' he admitted at last when the question had been put to him a second time—'yes, Krail. You speak the truth. It is neither affection nor friendship.'

(To be continued.)

A CHEAP HOLIDAY IN BRITTANY.

MOST people who can afford it prefer a holiday abroad to one at home, because it obviously gives more change of air, of *cuisine*, of scene, and of surroundings. A very little knowledge of the language goes a long way in France. The return ticket from London to St Malo, second-class by rail and first-class by steamer, costs forty-nine shillings and twopence, and a variation by Guernsey and Jersey from the direct route is included. In August (when the boats run every night except Sunday) private cabins should be engaged in advance by writing to Mr T. M. Williams, Southampton (telegrams, 'Foremost').

From Paramé, east of St Malo, to Dinard, St

Enogat, St Lunaire, St Briac, St Jacut, and St Cast, to the west, from June to the end of October you are almost sure of continual sun, with hardly a wet day; while up to the end of January much sun and an even temperature only ten degrees Fahrenheit lower than that of the Riviera are rightly relied upon by the many permanent residents. Fogs are rare, and the rainfall is extremely low. The air is very fresh in the warmest summer weather, especially at St Enogat. That hard-worked Gulf Stream is, as usual, supposed to be a factor in causing some of its blessings. More sheltered than Dieppe and the Normandy *plages*, it is not so cold in bad weather. Shade and rest to the eye are at hand in the orchard-country and in the wild wastes, gorgeous with five kinds of heather, which flourishes exceedingly among the ferns under the great pines and Spanish chestnuts in the forests as well as in the more open spaces among the gorse.

In one very deep and lovely lane near St Enogat, roofed over by Gothic branches, I lately found the hart's-tongue, prickly shield, holly, rusty-back, black and maidenhair spleenwort, cystopteris fragilis, and a number of the commoner ferns; while, not far off, the green and the sea spleenworts, the royal, and the ruta muraria abound.

The Customs examination (a little tea and tobacco are allowed, and should be declared) on your arrival at St Malo is strict and abominably managed; but then your troubles are over. If Paramé is your destination, you should order your omnibus beforehand. Its hotels are fairly good, though expensive —from ten francs *pension* upwards. There is an excellent casino, a lawn-tennis club, and a splendid wide beach for children. Owing to the absence of cliffs and shade, however, the scenery is uninteresting. Paramé and St Malo are on the east side of the mouth of the Rance, the Rhine of France. To get to Dinard or the other *plages* to the west, cross the Rance, a lovely passage of ten minutes by steamer, electric vedette, or sailing-boat, having first given your larger belongings to the commissionaire Ropert, who is noted for his honesty and his command of winged words to his underlings. The London and South-Western Railway Company equally undertake to deliver luggage (none too rapidly) at your hotel. Ropert's tariff is one franc for each large package, and half a franc for the smaller ones; but, if possible, a reduction should be arranged with him personally, especially if there is much luggage.

Caldecott and others have made the characteristics of Brittany familiar. Here, then, we may only refer to some leading attractions and excursions. Cancale, seven miles from Paramé, with the quaint costumes of its pretty lace-makers, is famous for its oyster-beds. A rare storm may give you a chance of seeing, in the shelter of the nearest farm or cottage, the polished wardrobes, old chests, and kitchen-dressers, with their fine brass mountings and old keys; while the villages, churches, and old manor-houses are often charming and full of interest. Dol Cathedral, fifteen miles from St Malo, was founded in 1300 on the site of the old monastery of St Samson, a Scottish disciple of St Columba. On its grand old gray granite walls the ancient legend still runs: 'Il est interdit aux Bohémiens et Nomades de stationner sur le territoire de Dol.' Shade of Quentin Durward! Louis XI., who founded the order of the Knights of St Michel, possibly originated this interdict. Combourg, the château of the Chateaubriands, not far from Dinan, can be visited on Wednesdays. The Duc de Rohan generously opens his château of Josselin to strangers. The ruined château of La Hunaudaye lies in a forest, formerly of immense extent, where the deer, the wolf, the bear, the lynx, and the boar used to roam. Here Gilles de Bretagne was done to death in the dungeon by his brother. The château of Guildo is a splendid ruin on the coast to the west of St Jacut.

Mont St Michel, thirty-three miles from St Malo, crowned by a superb abbey founded in 708—the wonderful rock which withstood so many sieges and whose people sent six ships with William the Conqueror—has been called the Mecca of France. Its ancient battlements and cloisters are undoubtedly among the finest relics of pure medieval architecture in the world. Here from 1414 to 1444 a few brave men kept alive the Lily of France, which the English had laid low almost all over the country. These two hundred Norman and Breton gentlemen, led by the now forgotten Jean d'Harcourt, who met a glorious death at Verneuil in 1424; Nicole Paynel, seigneur de Bricqueville; Louis d'Estouteville, seigneur d'Auzebosc, and his son, sacrificed their lands, risked their all for their country, and successfully endured constant and simultaneous attack by land and sea. The intrepid sailors and corsairs of St Malo, who feared neither the dangers of the coast nor the English fleets, aided and revictualled them on dark nights. Space forbids the reference to many other fine châteaux and places of interest.

Dinard—at the west point of the mouth of the Rance, facing the fine old ramparts of St Malo, its cruel islands, rocks, and forts, and the white tomb of Chateaubriand—is the gayest and most cosmopolitan of bathing-places, 'La reine de la côte d'émerande.' Half the town faces up the Rance, with its lovely Plage du Prieuré and the romantic walk round the Vicomté. Here from the terraces of the club you can watch almost the entire course and the finish of the numerous regattas. On the other side is the well-known *plage* in front of the casino, where famed travellers of all nations are glad to gather year after year from July to September. The lawn-tennis club, about the best in France, with its nine gravel courts, holds weekly tournaments for handsome prizes given by visitors, as well as the big tournament in September, when often the best play in the world can be seen. There is much dancing at the casinos and in the clubs, and in the splendid private villas there are frequent bridge tournaments. There is the steam-tram to St Briac,

five miles off, an unspoilt *plage* with natural seaside golf-links. Some of the holes are of the best, though the greens are very parched in August. The Hôtel de Paris, near by, is clean, popular, and moderate. Paramé, Dinard, St Enogat, and St Lunaire in the season are very gay and attractive to young and old alike. On their firm sands various *ententes cordiales* are cemented by the crowds of happy children of many nations, as they play lawn-tennis, badminton, croquet, hockey, cricket, rounders, golf, and many Continental games. Gymkhanas, water-polo, sand-fort competitions, &c. are frequent; while you hear for nothing the best Hungarian bands on the casino terraces.

There are English churches or services everywhere; while, thanks to the work of the late Mr Gardner, an admirable hospital for the district exists. Picnics, paper-chases, race-meetings, motor and bicycle excursions, vary the round of dances, plays, tableaux, bazaars, and tournaments. All this can be enjoyed for a moderate sum at certain hotels, such as the Windsor at Dinard, where the *cuisine* is very good, and where in August they have to arrange three lunches and dinners for their four to five hundred guests. Here a party staying for some time can, in the season even, arrange terms from eight francs, including cider. The Hôtel d'Angleterre also has a good reputation, and is moderate. There are many others to suit longer purses, up to the Royal, which is quite first-class, and the Crystal, just remodelled, with the latest improvements and splendid baths of all sorts.

If, however, you do not care for the excitement and social duties involved in this Breton Mayfair, where nearly all is vanity beneath a perpetual sun, you can live very well indeed for less money at the adjoining St Enogat, which is the real country, with better air and bathing. You can enjoy the casino and club-life at Dinard, and the tennis there, all the same, while you are a mile nearer the golf-links. The Hôtel de la Mer, with its numerous villas, is splendidly situated on the high cliffs surrounding the beach; and if you like you can bathe directly from your rooms. The sunsets behind Cap Frehel and the rocky islands are superb. There are so many walks and drives and excursions that till dinner you never seem to see the four hundred guests who come year after year to this children's paradise. Many pleasant Anglo-French friendships are formed here. Many an army-boy owes his high marks in French to his devotion to his charming partners in the French waltz, the *boulangère*, &c. How many insular prejudices here melt away! How many invalids and tired workers here become bronzed and strong again! There are no extra expenses to fear except Mrs Davis's tea-rooms on the cliff, where everything is home-made and good.

The prices at St Enogat for a long stay vary from six francs upwards, according to rooms; and at the Hôtel de la Mer and its larger *annexe* the Michelet (so well managed by Mademoiselle Marie Pierre), excellent red and white wines are included. The Pension Victoria, so long a favourite under Mademoiselle Salvator, must also be recommended. There are lawn-tennis courts. The sea-fishing and sailing are tempting, while at low-tide the caves and rock-pools, with the wonderful octopus as a prize, are the unfailing joy of the barelegged contingent. There are steamer excursions from Dinard to Cap Frehel, with its wild, heather-capped cliffs, to the fifty islands of Chausey (the only place in France where no electoral notice ever disfigures the walls, and where no motor siren screams), to Cancale, to Mont St Michel, to Jersey and Guernsey, to Granville in Normandy; there is the fairy sail up the Rance to Dinan, loved by artists for its old-world peace and beauty; and there are walks and drives to Ville-Revault, La Richardais, lakes, châteaux, and points of view innumerable. St Servan also, with its fourteenth-century tower of Solidor and its old furniture shops, is just across the Rance.

St Malo, one of the greatest ports of France, is said to have been named from a Welsh monk, its first bishop, St Maclou, in the sixth century. In its narrow streets and old houses you come across fine fellows, mostly sailor-men, descendants of the corsairs who preyed on English commerce, fought English fleets, and resisted English sieges: of such as Du Guesclin, Jacques Cartier (who discovered Canada in 1534), Admiral Duguay Trouin, Robert Surcouf (who enriched St Malo by capturing and putting to ransom Rio Janeiro in 1711), Mahé de la Bourdonnais (who wrested Madras from the English in 1746), and many others. The taunt, 'Have you been to St Malo?' which implies that your calves are conspicuous by their absence, recalls the St Malo packs of bulldogs which from 1155 to 1770, between ten at night and dawn, ferociously patrolled the streets and guarded the ships on the quays. There was a special tax for the upkeep of these police till they were condemned to death by poison after devouring not merely the calves but the entire body of a revenue officer.

A remarkable record of the French marine enumerates one hundred and sixty-two convoy ships of war and three thousand three hundred and eighty-four merchant-vessels captured by the men of this fighting town during the nine years up to 1697.

And now our race is run. We have won health and strength and happiness, and new friends. Let us leave our bathing-suits, garden-chairs, and summer impedimenta of all kinds in the care of our courteous hosts of the Hôtel de la Mer. Here, as often before, right up to October, we have joyed in the seas warmed by the sun-kissed sands, 'in fights for the fearless and goals for the eager,' in the dance, in the perfect fruitions as well as in the ruins of storied art, in nature above all. Back to home and work, brown and blessed with new strength to combat the fogs of England and the various 'slings and arrows of outrageous fortune,' and, by surviving, end them.

THE BLUNDERERS.

CHAPTER III.

ON the following afternoon, as a certain train slowed down before entering Waterloo Station, Francesca Duncombe, sitting on the back seat of a third-class carriage, read over a letter she had just written in pencil, before sealing it up in the envelope which lay ready addressed beside her.

'DEAR FATHER'—it ran—'I hope you will get this by the evening post, before you have time to be anxious about me. I have left home for some time, because I am afraid if I stayed that I should end by giving in. You are much stronger than I am, and could make me do as you want. So my only chance is in going away. I can't obey you in this thing, though I think I would in any other, as I have done all my life. But I am sure it is wicked to marry a person except when one cares for him. I am afraid it is wrong to go away; but when you spoke to me last night after Mr Blake had gone I saw it was the only thing to do. I couldn't see any help anywhere. FRANCESCA.

'*P.S.*—I have taken my money out of the savings-bank, and shall manage quite well till I can find some work to do. I do not think you will miss me, because I am afraid I have never been a companion to you. So that I hope you will not mind my going away.'

It was curious that hardly a misgiving as to what her father's feelings would be on receiving this missive crossed her mind. She imagined the expression on his face as he read the letter. He would feel cold anger first, then a sense of impotence, and finally he would renounce her, perhaps not without a faint feeling of relief.

Poor John Duncombe! Poor Francesca! That she should read, or think to read, his mind like this showed the frozen atmosphere in which they had passed together two-and-twenty years of what should have been happy, loving intercourse.

The train drew up at the platform, and Francesca, her heart beating fast and a shaky sensation at her knees, stepped out.

'Luggage, lady?' asked a porter, looking curiously at two large brown-paper parcels which she carried under her arm.

'No, thank you,' she said politely; 'I have only these parcels. But could you find me a hansom cab?'

The porter responded with alacrity, and hailed a hansom, while Francesca posted her letter in a red letter-box which caught her eye. Then he helped her into the hansom, and asked for directions. 'I want to go to South Kensington; but ask the cabman, please, to stop somewhere first where they sell travelling-trunks.'

He repeated the instructions, and then stood looking at her so persistently that she realised with a start what he was expecting. She had never travelled alone before, so had had no experience in tipping, and was very vague as to the sum this particular occasion required. However, she bestowed on him a shilling, and was relieved to see that it seemed acceptable.

She had heard that hotelkeepers and landladies look askance on would-be guests without luggage, so her first care was to supply herself with a box in which to deposit her parcels. It had been, of course, impossible under the circumstances to convey luggage to the station at Stellbridge; so she had taken only the few garments and necessaries with her that she could conveniently carry under her arm. With these, and ten pounds which she had drawn out of the savings-bank, she had set out to face the world.

She felt a good deal of natural excitement as she gazed from her hansom on the world of London. She recognised the Houses of Parliament and Westminster Abbey with a thrill; the busy traffic of Victoria Street appealed to her mood after the quiet of Stellbridge. Then as they emerged from Constitution Hill on to the wide space at Hyde Park Corner, where streams of traffic meet, mingle, and part, she leaned forward and gazed, fascinated.

She had named South Kensington as her destination, as it was in that locality that she had stayed a week with the Misses Garner two years before. When the cabman called down for a more definite direction she said, 'I'm looking for furnished rooms. Do you know of any?'

His answer was to pull up his horse abruptly. 'Here's "Apartments to Let,"' he said. 'Try here.'

Francesca got down and rang the bell. The outside of the house was not attractive; but she knew that appearances are sometimes deceptive. A dejected-looking woman opened the door.

'Have you a bedroom to let?' asked Francesca.

'I've top-front,' said the woman apathetically. 'Like to see it?' She took her up many stairs to a dingy room looking on to the street. The curtains were ragged, the carpet worn and stained; one of the chairs wanted a leg. There were crumbs on the floor, and Francesca shivered when she looked at the bed.

'What is the charge a week for this room?' she asked, wondering how she could beat a retreat.

'Five shillings a week,' answered the dejected woman. 'It is a nice, cheery, bright room. You might go all over London'——

She was interrupted by a terrible voice that thundered up the stairs, 'Emmer! EMMER! ye've been and locked up the whisky again, 'ave yer?' A slight pause, then again, 'Emmer!' and heavy steps began to mount towards them.

'Please to excuse me,' said the landlady. 'It's me 'usband.' She left the room without any hurry or agitation; but Francesca heard the sounds of a scuffle on the stairs, whispered pleading, and angry mutterings in response. She held her breath in horror, and for a moment fervently wished herself safe back in the Rectory at Stellbridge. Then the sounds retreated to the bottom of the house.

She went out of the room and listened. A door banged somewhere below. In a moment she was downstairs and outside. She sprang into the cab. 'Drive on into the next street,' she said breathlessly; 'those rooms won't do.'

The cabman drove slowly round the corner. Francesca, breathing more freely, peered out at the houses as they passed. 'Stop!' she cried suddenly.

They were in a street of small houses off the Fulham Road. A window-box of bright geraniums caught her eye—it was the only one in the street—and above it hung a clean white card on which was written 'Furnished Apartments.'

'I am sure this is a better sort of house,' she thought, as she courageously rang the bell. 'If the landlady likes flowers she must be more or less nice.'

The door opened slowly and deliberately. Before her stood a woman of about fifty, who seemed entirely to fill up the doorway, so vastly stout was she. Her face was large and kind, and positively beamed with benevolence.

'Yes, miss,' she said before Francesca had spoken—'yes, miss; nice rooms, miss. Yes. I suppose you've come about them. Yes, small they are, but no nicer rooms in London, I always say. Yes, come and look at them, miss.'

Francesca always said afterwards that she fell in love with Mrs Broad at first sight. Her motherliness, her honest face, her clean, bright rooms, were in such contrast to the horrible experience of ten minutes before that she figuratively fell at her feet.

She took a room at a moderate price, and, having seen her little box deposited in the hall, went out to pay the cabman.

'How much do I owe you?' she said innocently. 'I am afraid I have kept you waiting.'

'Ten shillings, mum,' replied the cabman promptly.

Francesca looked at him in doubtful dismay, but his face was inscrutable. She was meekly preparing to pay the monstrous charge when Mrs Broad's voice resounded behind her.

'Where did you come from, then? Waterloo; waited at a shop, did you, and at a 'ouse too? Ten fiddlesticks! Give him five. That's it; yes, miss. Come in, miss, then. Ten, indeed!'

Thus Francesca came under the wing of Mrs Broad.

They became firm friends that night over a cup of tea which Mrs Broad brought up for her new lodger at five o'clock.

'Things 'ave been slack lately,' the landlady said confidentially, 'for all it's the busy time of year. So I was really pleased when I saw you were somebody after the rooms. And *extry* pleased, miss, if I may say so, when I saw you was a lady—yes, miss, I mean a *real* lady. You see, I know the difference, 'aving known a lot of real ladies. I was 'ead-'ousemaid to Lady Gartry for fifteen years, and then me getting too stout for me work, I married Mr Broad the butler; and then, Mr Broad getting tired of service, we set up this 'ouse ten years ago, and took lodgers. It's only meself now, seeing as Mr Broad passed away three years ago come next October'—— Here the good lady's apron went to her eyes for a moment before she resumed cheerfully, 'And we done real well from the time we started. I 'ave just the two lodgers just now, miss, besides yourself: Mr Smith, downstairs, w'at's a clerk, and Miss Taylor, a young lady from Marshall & Snelgrove's—she's in the top-back, and a pleasant girl.' Mrs Broad here paused for breath. 'Well now, I'll leave you, miss, for you'll need a rest.'

But it was Francesca who now had something to say. 'Tell me, Mrs Broad,' she said, catching the landlady's sleeve as she turned to go, 'how shall I find work? I've come up to London to find work. I have got money enough to keep me for a few weeks; and by the end of that time I must find some way to live.'

Mrs Broad stared. 'Bless you!' she exclaimed, 'I don't believe you're the kind that is meant to work. But there, 'ard times is apt to come to all of us. Ain't you got no people, then, miss?'

'None that are of any use to me at present,' Francesca answered. 'I must make my own way just now. Tell me—you must know London well—what *is* there for me to do?'

'Well, miss,' said the landlady, with a fat, comfortable sigh, 'we must sleep on that. Talk to Miss Taylor. Perhaps there's a vacancy at Marshall and Snelgrove's; though you wasn't meant for that, I know. Or 'ow would governessing suit you? Of course you've got some references?'

'No,' said Francesca, looking straight at the questioner. 'I want to get on without referring to any one. That is what will make it difficult.'

'You'd better tell me, miss,' said Mrs Broad coaxingly, 'w'at it is as has brought you up to London all alone. There's some that would mistrust you in my place, but I know an honest face when I see one. Only, if you told me more, maybe I could help you more.'

Thus adjured, Francesca told Mrs Broad as much of her story as she thought it prudent to disclose. Some instinct of caution led her to disguise her name as Dunn, though it was extremely improbable that she, with her limited acquaintance, should come across any one she knew. The hint of an unwelcome love-affair delighted Mrs Broad, and she abated none of her sympathy when the explanation was at an end. She withdrew, promising her help and support in finding employment.

That night, after putting out her light, Francesca

leaned from her window and reviewed the day's events. What an age seemed to have passed since she had left Stellbridge in the morning! How far away the Rectory garden seemed! Her letter would have arrived by now. For the first time she felt a qualm as she thought of her father. But the letter would reassure him, she reflected, not in the least realising that what she had written would hardly tend to quiet an anxious mind.

Sounds came up to her from the street below—footsteps passing up and down, voices talking, and now and then a cab rattling by; from farther off came the roar of the Fulham Road, calls of newsboys with late specials, the jingle of hansoms mingled with the dull roar of the omnibuses. How vast the city seemed, and how busy and throbbing with life! She felt suddenly very small, and like a lost child. An intense loneliness seemed to grow around her. There was no doubt about it, she had a distinct touch of home-sickness.

Then, all at once, before her mind's eye rose the face of James Blake. How rude and childish she must have appeared to him! But why had he spoken in that confident and complacent tone about not giving her up? He had said no word of caring for her. He had asked her to marry him, she was convinced, because he considered it the proper thing to marry when one had settled down and bought a place. He was the kind of person that would always do the proper thing. She was glad, very glad, that she had spoken plainly, and shown that she understood him. But—— It was with a 'but' in her mind that she was only dimly conscious of, and shrank from inquiring into, that Francesca finally fell asleep.
